DAMASCUS to EDUCATION IN ANIMALS

DAMASCUS, capital of the Syrian republic and chief city of the province of Damascus, 57 mi S E of Beirut, in lat $33^{\circ} 30'$ N and long $36^{\circ} 18'$ E. Population (1947 census), 310,246.

Situated under the eastward slopes of the Antilebanon, at the edge of the Syrian desert, Damascus owes its existence to the river Barada, which breaks through the Antilebanon at this point and whose waters are distributed by an ingenious system of canals to irrigate an extensive fan-shaped tract of land, known as the Ghutah. Orchards of fruit trees (olives, apricots, figs, pomegranates, pistachios and almonds) are intermingled with fields of wheat, barley and maize and groves of poplar and walnut, seen from a point of vantage (as from the northern suburb of Salhiyah, on the slope of Mount Kasayun), the white minarets of the city rising above the mass of verdure leave an ineffaceable impression. The city stands on the main channel of the Barada, at the northwestern edge of this oasis. The ancient town, roughly rectangular, was huddled on the south bank and protected by a wall, of which portions still remain. The modern city is spoon-shaped, the long handle to the south along the Mecca road forming the quarter known as the Meidan. A suburb, Suk Sarouja, was built on the northern bank, and farther toward the northwest is another suburb, Salhiyah, both of these were greatly expanded and connected by newer suburbs. The old city was divided into quarters, the Jewish quarter being at the southeastern angle and the Christian at the northeastern.

The city is supplied with water from the Barada by an extensive system of canals and conduits. Its streets are for the most part narrow and protected overhead, and the high walls which conceal private dwellings belie the magnificence to be found within. Its public buildings—mosques, schools and khans—present many fine examples of Arabian art. To a partial extent sheltered by hills to the north, west and south, the city lies open to the east and its trying and prevalent winds. It suffers a great variation in temperature in the course of the year. In winter frost and snow are not unknown, and summer temperatures are high, but the nights are always cool. Fever, dysentery and ophthalmia caused by the climatic conditions are prevalent.

In modern, as in earlier times, the development of the city has been affected by great outbreaks of fire. The Great mosque was

guttled in 1893, and in 1912 a conflagration destroyed a considerable tract of bazaars. It is said that Damascus has 240 mosques, mostly dilapidated, of which 70 were still in use at mid 20th century. Catholic and Protestant missions support several educational institutions and hospitals. Damascus is also the seat of the Syrian university.

Antiquities—The ground plan of the city may be said to have remained unaltered since the Mohammedan occupation at least, and a conflagration such as reduced the city to ashes in 1491 merely cleared the site for fresh building. Material and facilities for archaeological study are consequently less than might have been expected. The hand of the Roman workman is visible in what is left of the city walls and gates, in the area of the Great mosque, in the Darb al Mustakim or "Straight street," which was probably colonnaded, and in an aqueduct in the western quarter. The Great mosque (or Omayyad mosque) was originally the church of St John Baptist, begun by the emperor Theodosius (375) and completed by Arcadius (395-408). It occupied the site of an earlier temple, probably that of Rimmon (*cf* II Kings v, 18). The Omayyad caliph al Wahid deprived the Christians of their building (705) and destroyed it in great part before erecting it as a mosque. It was burned down in 1069, pillaged by Timur (1400) and badly damaged by fire in 1893. The Citadel in the northwestern angle of the city was built under the Seljuk occupation, rebuilt after 1206 as a royal residence, refortified by

GENERAL VIEW OF THE CITY OF DAMASCUS SHOWING IN THE DISTANCE THE COVERED STREET WHICH IS CALLED STRAIGHT

Sultan Bibars (1262) and maintained by the Ottoman Turks. An inscription of Mohammadan architecture and art was established by the French, as well as a school of Arabic decorative art to revive the work in glass and wood and the colouring of stuffs. A Syrian national museum was also instituted.

Commerce—The economic importance of Damascus derives from its agricultural wealth in relation to the trade routes of the Syrian steppeland, and from the earliest times it has been the market of the desert. For westward trade, on the other hand, it long suffered from lack of easy access to the sea. Ezekiel (xxvii, 18) mentions its "wine of Helbon" and its wool, and in classical times it had a reputation for its Chalybeian wine (see of Helbon, modern Halban, 13 mi N N W of Damascus). Its dried fruits (*pruna et cottana* Juvenal ii, 83), still a local specialty, were valued present, and its linens, cloths and cushions were famous. For centuries the "Damascene blade" carried far afield the reputation of the city's armourers. Diocletian promoted this industry but it perished when Timur carried off the smiths in 1401. The silk looms are less important now than formerly, but modern industries such as leather work, the filigree work of gold and silver-smiths and inlaid work in wood and metal (brass, copper) survived. Damascus was hard hit by World War I, and industry revived slowly. The textile industry suffers from foreign competition, and dyeing has declined accordingly. Railway connection with Hauran (1894), Beirut (1895) and Haifa (1905) diminished the caravan trade. Damascus was tending more and more to become a centre for imported foreign goods as well as local produce. (E. Ro., X.)

History—The origin of Damascus is unknown, and the belief that it is the oldest city in the world still inhabited has much to recommend it. It is mentioned in the account of the battle of the four kings against five, in the book of Genesis (ch. xiv), where Abram (Abraham) is reported to have pursued the routed kings to Hobab, north of Damascus (verse 15). In the period of the Egyptian suzerainty over Palestine in the 18th dynasty Damascus (whose name appears in the Tell el-Amarna tablets as Dimashka) was capital of the province of Ubi. Toward the end of that period the overrunning of Palestine and Syria by the Khabiru and Sutu evidently changed the conditions, language and government of the country, and the Aramaean form, Damesek, appears in an inscription of Rameses III. Damascus soon reached such strength that though Tiglath-Pileser I reduced the whole of northern Syria, he did not venture to attack Kadesh and Damascus, so that this kingdom acted as a buffer between Assyria and the rising kingdom of Israel.

David made an expedition (II Sam. viii) against Damascus as a reprisal for the assistance the city had given his enemy Haddadezer, king of Zobah. The Israelite possession of Syria did not last long. A subordinate of Haddadezer named Rezon (Rasun) succeeded in founding a dynasty there, and throughout Solomon's reign he was a constant thorn to Israel (I Kings xi, 23 seq.).

It is inferred from I Kings xv, 19 that Abijah, son of Rehoboam, king of Judah, made a league with Tabrimmon of Damascus to assist him in his wars against Israel, and that afterward Tabrimmon's son Ben-hadad came to terms with the second successor of Jeroboam, Baasha. Aha, son of Abijah, followed his father's policy and bought the aid of Syria, whereby he was enabled to destroy the border fort that Baasha had erected (I Kings xv, 22). Hostilities continued between Israel and Syria. Syria established a quarter for Syrian merchants in Samaria (I Kings xx, 34). A Syrian defeat at Aphek, when the king of Israel acted too leniently, was the cause of a prophetic denunciation (I Kings xx, 42). According to the Assyrian records Ahab fought as Ben-hadad's ally at the battle of Karkar against Shalmaneser III in 835 B.C. This seems to indicate the vassalage of Ahab, of which no direct record remains, and it was perhaps in the attempt to throw this off that he met his death in battle (I Kings xxi, 34-40). In the reign of Jehoram, Naaman, the Syrian general, came and was cleansed by the prophet Elisha of leprosy (II Kings v).

In 842 Hazael assassinated Ben-hadad and made himself king of Damascus. The states which Ben-hadad had brought together into a coalition against the advancing power of Assyria all re-

volted, and Shalmaneser, king of Assyria, took advantage of this and attacked Syria (842). He wasted the country, but could not take the capital. Jehu, king of Israel, paid tribute to Assyria, for which Hazael afterward revenged himself, during the time when Shalmaneser was distracted by his Armenian wars, by attacking the borders of Israel (II King x, 32).

Adad-nir III invaded Syria and besieged Damascus, c. 805-802, and Jehoahaz, king of Israel, seizing the opportunity, recovered the cities that his father had lost to Hazael. In 735 Ahab of Judah was attacked by Rezon (Rasun, Rezin), king of Damascus at the same time the Edomites and the Philistines revolted. The king of Assyria, Tiglath-Pileser III was besought to help invading Syria, he reduced Damascus in 733.

Except for the abortive rising under Sargon II in 720, we hear nothing more of Damascus for a long period. In 333 B.C., after the battle of Issus, it was delivered over by treachery to Ptolemy, the general of Alexander the Great. It had a chequered history in the wars of the successors of Alexander, being occasionally in Egyptian hands. In 112 B.C. the empire of Syria was divided by Antiochus Grypus and Antiochus Cyzenus, the city of Damascus fell to the share of the latter. Hyrcanus took advantage of the disputes of these rulers to advance his own kingdom. Demetrius Eucerus, successor of Cyzenus, invaded Palestine in 88 B.C. and defeated Alexander Jannaeus at Shechem. On his dethronement and captivity by the Parthians, Antiochus Dionysus, his brother, succeeded him, but was slain in battle by the Nabataean king Haritha (Aretas). Haritha yielded to Tigranes, king of Armenia, who in his turn was driven out by Q. Caecilius Metellus. In 63 B.C. Syria was made a Roman province, but Damascus remained under the government of the Nabataeans.

In the New Testament Damascus appears only in connection with Acts ix, xxi, xxvi, II Cor. xi and Gal. i. In A.D. 106, under Trajan, Damascus became a Roman provincial city. Under the Romans the city was largely reconstructed and the canalization replanned. On the establishment of Christianity Damascus became the seat of a bishop who ranked next to the patriarch of Antioch, and the great temple was turned into a Christian church.

In 635 Damascus was captured by the Moslem Arabs under Khalid ibn al-Walid. After the murder of 'Abd al-Malik, in 661 his successor Mu'awiya transferred the seat of the caliphate to Damascus. With him began the great dynasty of the Omayyads,

THE COVERED STREET CALLED STRAIGHT WHICH RUNS FROM THE EASTERN TO THE WESTERN GATE OF DAMASCUS

yads, whose rule extended from the Atlantic to India. Ninety years later it was supplanted by that of the Abbassids, who moved the seat of empire to Mesopotamia, and Damascus fell to the rank of a provincial capital. After the decline of the Abbassids in the middle of the 9th century, it was generally held by the rulers of Egypt (with intervals of Bedouin incursion and military revolt) until the Seljuk conquest in 1076.

With its occupation by Nureddin in 1154 and under his successor Saladin (q.v.), Damascus became the headquarters of the Moslem forces in the wars with the Franks and regained or surpassed its former prosperity. In spite of the wars between Saladin's suc-

cessors, the Ayyubite kings of Egypt and Syria, the city continued to expand and to develop as a centre of commerce and Moslem civilization. After a brief occupation by the Mongols in 1260 it was recaptured by the Mameluke Kotuz and became the principal of the six governments in Syria under the Mameluke sultans of Egypt. In Dec 1400 it was devastated by Timur (Tamerlane) and never fully recovered. In 1516 it passed into the possession of the Ottoman sultans of Constantinople, under whom Syria was divided into four pashaliks, of which that of Damascus was the highest. The city continued to enjoy a fair degree of prosperity, particularly on account of its position as the headquarters of the Turkish pilgrim caravan to Mecca, to which the expansion of its southern suburb, the Meidan was due. During the 19th century new suburbs grew up to the north and west, a development greatly accelerated following World War I. Among the more notable incidents in its 19th-century history may be mentioned the massacre of July 1860, when the Christian quarter was burned and thousands of Christians slaughtered.

During World War I, Damascus served as the headquarters of the Turkish and German forces which, under Gen Otto Lim von Sanders, tried to block the Suez canal and to oppose the British advance into Palestine. The Egyptian expeditionary force under Gen E. H. H. Allenby and the Arab army commanded by the Emir Faysal ibn Husain entered Damascus on Oct 1, 1918. Faysal made his formal entry on Oct 3 and proceeded to establish the government for an independent Syria, with Damascus as the capital. In the hope of forestalling the proposals for French and British mandates in Syria and Palestine, a Syrian national congress, meeting in Damascus, opened, on March 11, 1920, the royal crown of Syria to Faysal and unanimously adopted on July 3 a democratic constitution for a united Syria, including the Lebanon and Palestine. This was followed by an ultimatum from the French high commissioner in Beirut, Gen Henri Gouraud, on July 19, demanding unconditional recognition of the French mandate. An Arab army, under Yusuf al Akm, the minister of war, met the French at Khan Messalun on July 24 and was defeated, Damascus was occupied by the French and the short lived kingdom brought to an end.

Under the French administration Syria was partitioned into a number of states, and part of the former province of Damascus was annexed to the new state of greater Lebanon. At first, Damascus remained only the capital of one relatively small administrative area, but in 1924 Gen. Maxime Weygand reunited Aleppo and Damascus in the state of Syria and made Damascus the capital. The policy pursued by the French met with vigorous opposition from the Syrian leaders, supported by the population of Damascus. Mass demonstrations on the visit of the American Charles Crane, on April 1, 1922, led to severe repression by the government, and similar demonstrations occurred in April 1925, when Lord Balfour visited Damascus, in protest against Zionism and the separation of Palestine from Syria. A constitution granted on Dec 5, 1924, provided for a Syrian state with an elected president, a ministry appointed by him and an elected legislative council, but no real power was given to the newly created native authorities. Syrian discontent continued.

Rebellion began in the mountains of the Druse state in July 1925. After the first successes under Sultan Pasha al Atrash, Damascus joined in the revolt. A provisional government was constituted, and for months the thickly populated oasis of Damascus formed a battleground. Nor did the city itself escape from Oct 18 to violent encounters took place in its streets, while the French army bombarded the centre of the city from the neighbouring hills. The revolt was not put down until 1927. Damascus was bombarded a second time by French artillery and aircraft on May 7, 1926, when the greater part of the Meidan quarter was damaged.

From 1928 a more conciliatory policy was adopted and a new Syrian constitution was promulgated by an elected national assembly in Damascus on May 14, 1930. Negotiations for a treaty between France and Syria were opened, the first proposals were rejected in Nov 1933 by the Syrians as unsatisfactory, and a second draft treaty in 1936, though accepted by the Syrians, was

KHAN SULEIMAN PASHA, AN OLD ROOFLESS BUILDING NAMED AFTER THE GREAT SULTAN OF TURKEY WHICH WAS FORMERLY AN INN BUT BECAME A THRIVING BAZAAR

never ratified by the French. At the opening of World War II, Franco-Syrian relations were thus still unregulated, and after the fall of France in June 1940, the danger of the Germans' exploiting Syria as a centre of axis propaganda and strategy in the middle east led to the occupation of Syria and Lebanon by Allied forces, British, Australian and Free French, in June 1941.

On Sept 28, 1941, the Free French authority proclaimed the independence of Syria with Damascus as its capital, and Sheikh Taj al Din al Hasan became first president of the new republic. But tension continued between the Syrian government and the French military authorities. After the war, in retaliation for a series of violent outbreaks, French troops again bombarded Damascus on May 31, 1945, but were immediately withdrawn on British intervention. (See also SYRIA.)

DAMASK, the technical term applied to certain distinct types of fabric. The term owes its origin to the ornamental silk fabrics of Damascus, fabrics which were elaborately woven in colours, sometimes with the addition of gold and other metallic threads. At the present day it denotes a linen texture richly figured in the weaving with flowers, fruit, forms of animal life and other types of ornament. "China, no doubt," says Rock (*Catalogue of Textile Fabrics*, Victoria and Albert Museum), "was the first country to ornament its silken webs with a pattern. India, Persia and Syria, then Byzantine Greece followed, but long intervals between, in China's footsteps. Stuffs so brought with them to the West the name 'diaspron' or 'diaspro'."

bestowed upon them at Constantinople. But about the 12th century the city of Damascus, even then long celebrated for its looms, so far outstripped all other places for beauty of design, that her silken textiles were in demand everywhere, and thus, as often happens, traders fastened the name of damascene or damask upon every silken fabric richly wrought and cunningly designed, no matter whether it came or not from Damascus."

The term is perhaps now best known in reference to damask tablecloths, a species of figured cloth usually of flax or tow yarns, but sometimes made partly of cotton. The finer qualities are made of the best linen yarn, and, although the latter is of a brownish colour during the weaving processes, the ultimate fabric is pure white. The high lights in these cloths are obtained by long floats of warp and weft, and, as these are set at right angles, they reflect the light differently according to the angle of the rays of light, the effect changes also with the position of the observer. Subdued effects are produced by shorter floats of yarn, and sometimes by special weaves. Any subject, however intricate, can be copied by this method of weaving, provided that expense is no object. The finest results are obtained when the so called double damask weaves are used. These weaves are shown under DIX, and it will be seen that each weave gives a maximum float of seven threads. (In some special cases a weave is used which gives a float of nine.)

The small figure here shown to illustrate a small section of a damask design is composed of the two single damask weaves, these give a maximum float of four threads or picks. No shading is shown in the design, and thus for two reasons (1) the single damask weaves do not permit of elaborate shading, although some very good effects are obtainable, (2) the available space is not sufficiently large to show the method to advantage. The different single damask weaves used in the shading of these cloths appear, however, at the bottom of the figure, while between these and the design proper there is an illustration of the 31st pick interweaving with all the 48 threads.

The principal British centres for fine damasks are Belfast and Dunfermline, while the medium qualities are made in several places in Ireland, in a few places in England, and in the counties of Fife, Forfar and Perth in Scotland. Cotton damasks, which are made in Paisley, Glasgow, and several places in Lancashire, are used for toilet covers, tablecloths and similar purposes. They are often ornamented with colours and sent to the Indian and West Indian markets. Silk damasks for curtains and upholstery decorations are made in the silk-weaving centres.

DAMASKINOS (1891-1949), a Greek archbishop, was born Dimetrios Papandriou on March 3, 1891, at Dobritza in Thessaly, Greece. He studied law and theology at the University of Athens, served in the Greek army as a private during the Balkan Wars in 1912 and took his holy vows as a priest in the Greek Orthodox Church in 1917. In 1922 he was elected bishop of Corinth, and later was raised to the rank of a metropolitan. In 1938 his election as archbishop of Athens and all Greece was voided by Premier John Metaxas because of his opposition to the regime, and Bishop Chrysanthos of Trebizond was appointed to that office. Damaskinos was exiled to a mountain monastery, but was recalled by the Holy Synod in 1941 to replace Bishop Chrysanthos who had refused to swear in the pro-Nazi premier, George Tsolakoglou. Damaskinos opposed the German occupation policy and went so far as to urge orthodox Greeks to conceal Jews to prevent them from falling into Nazi hands.

In late 1944 during the civil war between the royalists and the

DETAILS OF A DAMASK DESIGN

The name "damask" originally given to the woven silks of Damascus to day signifies a linen texture elaborately designed in the weaving.

Communists and Communist controlled groups in Greece, Archbishop Damaskinos was selected to serve as regent of Greece. In the following 16 months he appointed no fewer than five premiers in an effort to solve the political crisis and even formed an interim cabinet himself in Oct. 1945. In Sept. 1945 it was decided that before a plebiscite to determine whether Greece should be a monarchy or a republic, a general election should be held. The election, held March 31, 1946, resulted in a decisive royalist victory which was confirmed by the plebiscite of Sept. 1, 1946, and King George returned to the country on Sept. 27. Meanwhile, Damaskinos had resigned as regent on Sept. 5, and he thereafter took no direct part in political life.

DAMASK STEEL or **DAMASCUS STEEL**, a steel with a peculiar watered or streaked appearance, as seen in the blades of fine swords and other weapons of oriental manufacture. One way of producing this appearance is to twist together strips of iron and steel of different quality and then weld them into a solid mass. A similar but inferior result may be obtained by etching with acid the surface of a metal, parts of which are protected by some greasy substance in such a way as to give the watered pattern desired. The art of producing damask steel has been generally practised in oriental countries from a remote period, the most famous blades having come from Isfahan, Khurasan and Shiraz in Persia.

DAMASUS, the name of two popes.

DAMASUS I, Saint, was pope from 366 to 384. As a deacon he protested against the banishment of Pope Liberius (355), but when the emperor Constantius sent to Rome the antipope Felix II, Damasus, with the other clergy, rallied to his cause. When Liberius returned from exile and Felix was expelled, Damasus again supported Liberius. On the death of Liberius (366) he was nominated successor, but the irreconcilables of the party of Liberius set up against him another deacon, Ursinus. A serious conflict ensued which quickly led to rioting. The prefect of Rome recognized the claims of Damasus, and Ursinus and his supporters were expelled. They, however, persisted obstinately in their opposition to Damasus, combating him first by riots, and then by calumnious lawsuits, such as that instituted by one Isaac, a converted and relapsed Jew.

To the official support, which never failed him, Damasus endeavoured to join the popular sympathy. From before his election he had been in high favour with the Roman aristocracy. At that period the urban masses, but recently converted to Christianity, sought in the worship of the martyrs a sort of substitute for polytheism. Damasus showed great zeal in discovering the tombs of martyrs, adorning them with precious marbles and monumental inscriptions. The inscriptions he composed himself, in mediocre verse, full of Virgilian reminiscences. Several have come down to us on the original marbles, entire or in fragments, others are known from old copies. In the interior of Rome he erected or embellished the church which still bears his name (S. Lorenzo in Damaso).

The west was recovering gradually from the effects of the Arian crisis, and Damasus endeavoured to eliminate from Italy and Illyria the last champions of the council of Rimini. The bishops of the east, however, under the direction of St. Basil, were involved in a struggle with the emperor Valens, whose policy was favourable to the council of Rimini. Damasus, to whom they appealed for help, was unable to be of much service because that episcopal group, viewed askance by St. Athanasius and his successor Peter, was incessantly combated at the papal court by the hatred of Alexandria. The eastern bishops triumphed in the end under Theodosius, at the council of Constantinople (381), in which the western church took no part. They were invited to a council at Rome in 382, but few attended.

This council had brought to Rome the learned monk Jerome, for whom Damasus showed great esteem. To him Damasus entrusted the revision of the Latin text of the Bible. A short time before the pope had received a visit from the Priscillians after their condemnation in Spain and had dismissed them. Damasus died on Dec. 11, 384.

His writings are printed in Migne, *Patrol. Lat.* XIII. See also

Duchesne, *Liber Pontificalis* I, 212, J. Witig, *Papst Damasus I* (Kome, 1902) and *Die Friedenspolitik des Papstes Damasus I* (Breslau, 1912)

DAMASUS II, pope from July 17 to Aug 9, 1048, was the ephemeral successor of Clement II. His original name was Poppo, and he was bishop of Briven when the emperor Henry III raised him to the papacy.

DAME, properly a name of respect or a title equivalent to "lady," now surviving in English as the legal designation of the wife or widow of a baronet or knight, or of a dame of the Order of the British Empire, it is prefixed to the Christian name and surname. It has also been used in modern times by certain societies or orders, e.g., the Primrose league, as the name of a certain rank among the lady members, answering to the male rank of knight. The ordinary use of the word by itself is for an old woman. As meaning "mistress," i.e., teacher, "dame" was used of the female keepers of schools for young children, which have become obsolete since the advance of public elementary education. At Eton college boardinghouses kept by persons other than members of the teaching staff of the school were known as "Dames' Houses," though the head might not necessarily be a lady. As a term of address to ladies of all ranks, from the sovereign down, "Madam," shortened to "ma'am," represents the French *madame*, my lady.

"Damsel," a young girl or maiden, now only used as a literary word, is taken from the O Fr *dameiselle*, formed from *dame*, and parallel with the popular *danselle* or *doncele* from the M Lat *domicella* or *dommucella*, diminutive of *domina*. The French *damselle* and *dameiselle* are later formations which developed merely to the title of a young unmarried lady, the *mademoiselle* of modern usage, the English "miss." At the court of France, after the 17th century, *Mademoiselle*, without the name of the lady, was a courtesy title given to the eldest daughter of the eldest brother of the king, known as *Monsieur Anne Marie Louise* is known to history as *La Grande Mademoiselle*. The English literary form "damsel" was another importation from France in the 15th century. In the early middle ages *dameoiseau*, M Lat *domicellus*, *damecelle*, *dameiselle*, *domicella*, were used as titles of honour for the unmarried sons and daughters of royal persons and lords (*seigneurs*). Later the *dameoiseau* (in the south *donzel*, in Bearn *domengar*) was specifically a young man of gentle birth who aspired to knighthood, equivalent to écuyer, esquire (q.v.) or valet.

DAME'S VIOLET, the name for *Hesperis matronalis*, a biennial herb belonging to the family Cruciferae, and closely allied to the wallflower and stock, called also dame's rocket. It has an erect, stout, leafy stem, 2 to 3 ft high, with irregularly toothed, short stalked leaves and white or lilac flowers, $\frac{1}{4}$ in across, which give off a scent in the evening. The slender pods are constricted between the seeds. The plant is a native of Europe and temperate Asia, and is found in Great Britain and in the eastern United States and Canada as an escape from gardens.

DAMGHAN, town, Iran, in $36^{\circ} 10' N$, $54^{\circ} 20' E$, 216 mi from Tehran, on the high road to Khurasan, elevation 3,737 feet. Pop. 5,000. Damghan was an important city in the middle ages. Fath Ali Shah was born there in 1772. There is considerable trade in pistachios and almonds, the latter with very thin shells, for which Damghan is famous. The oldest mosque in Persia, the Tarik Khaneh (c. 775) and four fine towers (11th and 12th centuries) are still standing. Important archaeological excavations disclosed cultures ranging from 3500 B.C. to A.D. 500.

DAMIANI, PIETRO, SAINT (c. 1007-1072), celebrated ecclesiastic, was born at Ravenna, and after some years of teaching about 1035 entered the hermitage of Fonte Avellana, near Gubbio, where he became superior some eight years later. He entered into communication with the emperor Henry III, addressed to Pope Leo IX in 1049 his *Liber Gomorrhianus* denouncing the vices of the clergy, and soon became associated with Hildebrand in the work of reform. As a trusted counsellor of successive popes he was made cardinal bishop of Ostia in 1057, and presided over a council at Milan in 1059. He assisted Alexander II

in his struggle with the anti-pope, Honorius II, and having served the papacy as legate to France and to Florence, was allowed to resign his bishopric in 1067. After a period of retirement at Fonte Avellana, he proceeded in 1069 as papal legate to Germany, and persuaded the emperor Henry IV to give up his intention of divorcing his wife Bertha. He died at Faenza on Feb. 22, 1072. Damiani was a determined foe of simony and clerical marriage, and a vigorous controversialist.

His works published by Cardinal Cajetan, 4 vols. (Rome, 1606-15) are reprinted in Migne, *Patrol. Lat.* v, 144 and 145. See F. Neukirch, *Das Leben des Petri Damiani* (Göttingen, 1875), Kleinermanns *Der heilige Petrus Damiani* (Steyl, 1882), R. Biron, *St. Pierre Damiani* (1908), J. A. Endres, *Petrus Damiani und die weltliche Wissenschaft* (Münster, 1910).

DAMIEN, FATHER, the name in religion of JOSEPH DE VEUSTER (1840-1889), Belgian missionary, born at Tremeloo near Louvain, on Jan. 3, 1840. In 1858, he joined the Society of the Sacred Heart of Jesus and Mary (also known as the Picpus Congregation), and while still in minor orders, in 1863 went as a missionary to the Pacific Islands, taking the place of his brother, who had been prevented by illness. On reaching Honolulu he was ordained priest in 1864. Struck with the sad condition of the lepers, whom the Hawaiian government deported to Molokai Island, in 1873 he volunteered to take spiritual charge of the settlement. Besides attending to the spiritual needs of the lepers, he managed, by the labour of his own hands and by appeals to the Hawaiian government, to improve the water supply, the dwellings, and the victualling of the settlement, and after five years received assistance from other resident priests. He succumbed to leprosy, on April 15, 1889. Some ill considered imputations upon Father Damien by a Presbyterian minister produced a memorable tract by Robert Louis Stevenson (*An Open Letter to the Rev. Dr. Hyde*, 1890).

See *Life and Letters of Fr. Damien*, ed. by his brother, Fr. Pamphile (London, 1889) and M. Quinlan, *Damien of Molokai* (London, 1909), which reproduces Stevenson's letter.

DAMIENS, ROBERT FRANÇOIS (1715-1757), a Frenchman who made an attempt on the life of Louis XV on Jan. 5, 1757. As the king was entering his carriage, he rushed forward and stabbed him with a knife, inflicting only a slight wound. His mind seems to have been unhinged by the ecclesiastical controverted of the moment. He was condemned as a regicide, and sentenced to be torn in pieces by horses in the Place de Grève. Before being put to death he was barbarously tortured.

See *Procès originaux et procédures du procès fait à Robert François Damien* (Paris, 1757).

DAMIETTA, a town of Lower Egypt, on the eastern (Damietta or Phatnitic) branch of the Nile, a few miles above its mouth and 125 mi NNE of Cairo by rail. Pop. (1937) 40,332. Area 89 sq mi. The town is built on the east bank of the river between it and Lake Menzala. Though ill built and partly ruinous, the town possesses some fine mosques, with lofty minarets, public baths and busy bazaars. Along the river front are many substantial houses with terraces and steps leading to the water. Their wooden lattices of sawwork are very graceful. Once the third town in Egypt, it enjoys little more than a coasting trade, and ships of over 6 ft draught must anchor in the offing.

Damietta is a Levantine corruption of the Coptic name *Tamiati*, Arabic *Dumyāt*. The original town was 4 mi nearer the sea than the modern city. Under the Saracens it had great wealth and commerce, and, as the eastern bulwark of Egypt, was frequently attacked by the crusaders. In June 1249, Louis IX of France occupied Damietta without opposition, but being defeated near Mansura in the February following, and compelled (April 6) to surrender himself prisoner, Damietta was restored to the Muslims as part of the ransom exacted. To prevent further attacks from the sea the Mameluke sultan Bibars blocked up the Phatnitic mouth of the Nile (about 1260), razed old Damietta to the ground, and transferred the inhabitants to the site of the modern town. Damietta gives its name to *dmity*, a kind of striped cloth for which the place was at one time famous. Cotton and silk goods are still manufactured there and there is some trade in rice and salted fish.

DAMIRI, the common name of **KAMAR UD DIN MUHAMMAD IBN MUSÄ UD DAMIRI** (1344-1405) Arabian writer on canon law and natural history, he belonged to one of two towns called Damiri near Damieth and spent his life in Egypt. Of the Shiiite school of law, he became professor of tradition in the *Ruknuya* at Cairo and also at the mosque el Azhar, in connection with this work he wrote a commentary on the *Almujib ul Lahib* of Nawawi. He is, however, better known in the history of literature for his *Life of Animals* (*Hayat ul Hayawan*), which treats in alphabetical order of 931 animals mentioned in the Koran, the traditions and the poetical and proverbial literature of the Arabs.

The use of the animals in medicine, their lawfulness or unlawfulness as food, their position in folk lore are the main subjects treated, while occasionally long irrelevant sections on political history are introduced.

Several editions have been made at various times of extracts, among them the poetical one by Suyuti (q.v.), which was translated into Latin by A. Echelenius (1607). Bochartus in his *Hierozoicon* (1653) used Damiri's work. There is a translation of the whole into English by Lieutenant-Colonel Jaykar (Bombay, 1900-1908).

DAMJANICH, JANOS (1804-1849), Hungarian soldier, was born at Stasa in the Banat. On the outbreak of the Hungarian war of independence he was promoted to be a major of the third Honvéd regiment at Szeged, for although he was an orthodox Serb, he was from the first a devoted adherent of the Magyar Liberals. At the beginning of 1849 he was appointed commander of the 3rd army corps in the middle Theiss on account of his reputation for ability and valour. He fought battle after battle, so that after the battle of Isaszeg, Kossuth, at the ensuing review at Godollo, expressed the sentiments of the whole nation when he doffed his hat as Damjanich's battalions passed by. Always a fiery democrat, Damjanich uncompromisingly supported the extremist views of Kossuth, and was appointed commander of one of the three divisions which, under Gorgei, entered Vác in April 1849. After the catastrophe of Vilagos, Damjanich surrendered to the Russians, by whom he was handed over to the Austrians.

DAMMAR · DAMMLR

It is readily soluble in ether, benzol and chloroform, and with oil of turpentine it forms a fine transparent varnish which dries clear, smooth and hard. The allied kauri gum, or dammar of New Zealand (Austrian dammar), is produced by *Agathis australis*, or kauri pine, the wood of which is used for wood paving. Much of the New Zealand resin is found fossil in circumstances analogous to the conditions under which the fossil copal of Zanzibar is obtained. Dammar is besides a generic Indian name for various other resins, which, however, are little known in western commerce. Of these the principal are black dammar, yielded by *Cannarium strictum* (family Burseraceae) and white dammar, Indian copal, or piney varnish, the produce of *Vateria indica* (family Dip-

entaceae). The earliest recorded count of Dammartin, made himself master of the town in the 10th century. His dynasty was replaced by another family in the 11th century. Revnald I (Rennud), count of Dammartin (d. 1227), who was one of the coalition crushed by Philip Augustus at the battle of Bouvines (1214) left two co-heiresses, of whom the elder, Maud (Matilda or Mahaut), married Philip Hurepel, son of Philip Augustus, and the second, Alix married Jean de Thie in whose line the countship was reunited after the death of Philip Hurepel's son Albeic. In the 15th century the countship was acquired by Antoine de Chibannes (d. 1488) by his marriage with Marguerite, heiress of Revnald V of Nanteuil Aci and Marie of Dammartin. Antoine de Chibannes fought under the standard of Joan of Arc, became a leader of the *Ecorcheurs*, took part in the war of the public weal against Louis XI, and then fought for him against the Burgundians. The collegiate church at Dammartin was founded by him in 1480, and his tomb and effigy are in the chancel. His son, Jean de Chibannes, left three heiresses, of whom the second left a daughter who brought the countship to Philippe de Boulanvillers, by whose heirs it was sold in 1554 to the dukes of Montmorency. In 1632 the countship was confiscated by Louis XIII and bestowed on the princes of Conde.

DAMME, a decayed city of Belgium (pop. [1939] 1,135), 4½ mi. N.E. of Bruges, once so important as a commercial port that it had its own maritime law, the *Zeerecht van Damme*. It is on the canal from Bruges to Sluys (Ecluse), but in the middle ages a navigable channel called the Zwyn connected it with the North sea, the battle of Sluys, in which Edward III destroyed the French fleet, was fought in 1340 at its mouth. In 1490 a treaty was signed at Damme between the people of Bruges and the archduke Maximilian, and very soon after the channel became completely silted up, and the foreign merchant guilds or "nations" removed to Antwerp. The marriage of Charles the Bold and Margaret of York, sister of Edward IV, was celebrated at Damme on July 2, 1468. The town, although long neglected, preserves some remains of its former prosperity. The tower of Our Lady, dating from 1180, is a landmark across the dunes, and the church, although a shell, merits inspection, out of a portion of the ancient markets a town hall has been constructed, and in the hospital of St. Jan are a few pictures, and in the Place is a statue (1860) to Jacob Van Maerlant, the Flemish poet, who was clerk to the magistrates of Damme in the late 13th century.

DAMOCLES, one of the courtiers of the elder Dionysius of Syracuse. When he spoke in extravagant terms of the happiness of his sovereign, Dionysius is said to have invited him to a sumptuous banquet, at which he found himself seated under a naked sword suspended by a single hair (Cicero *Tusc.* v 21, Horace *Odes*, iii 1, 17, Persius iii 40).

DAMOH, a town and district of British India, in the Jubbulpore division of the Central Provinces. The town of Damoh is situated on the railway from Katni to Bina, a branch of the GIP railway, 48 m. E. of Saugor. It has small local industries and a large cattle market, and is a distributing and collecting centre for the district. Being situated below rocky hills it is decidedly hot. In pre-railway days its population was about 8,000, which had increased to 17,000 in 1911. In 1921, owing to an epidemic, population fell to 15,296 but was 26,795 in 1941. Damoh was looted by mutineers from Jubbulpore in 1857 and the district office was burnt.

The DISTRICT OF DAMOH is one of the smallest in the Central Provinces, having an area of 2,818 sq. m. and a population of 305,568. It is one of the Vindhyan districts and on the north and north-east borders Bundelkhand. It is drained by the Sonar and

been taken. Dyeing, weaving, pottery and the manufacture of bell metal utensils are the chief industries. Cattle slaughtering for the export of dried meat, bones, hides, horns and hoofs has been established near Damoh, the old and infirm cattle from long distances being brought in for slaughtering. Except for a little iron ore and sandstone for building, there is no mineral wealth in the district. There are notable temples at Bandakpur and Kundalpur and there are old Hindu and Jain remains at Nohia.

DAMON AND PHINTIAS (not *Pythias*), Syracusan Pythagoreans devoted friends. Condemned to death by Dionysius of Syracuse, Damion begged a short respite that he might arrange his affairs. Damion pledged his life for the return of his friend, and Phintias returned in time. The tyrant released both and begged to be admitted to their friendship (Diod. Sic. 4, Cicero, *De Off.* in 45, cp. Hyginus, *fab.* 257).

DAMOPHON, a Greek sculptor of Messene, who executed many statues for the people of Messene, Megalopolis, Aegium, and other cities of Peloponnesus. Considerable fragments, including three colossal heads from a group by him representing Demeter, Persephone, Artemis, and the giant Anytus, have been found on the site of Lycouria in Arcadia where there was a temple of the goddess called 'The Mistress'. They are preserved in part in the museum at Athens and partly on the spot. Hence there arose controversy as to the date of the artist, who was assigned to various periods, from the 4th century B.C. to the 2nd A.D. G. Dickens, however, by the help of inscriptions proved the date to be the 2nd century B.C.

See G. Dickens, *Annual of the British School at Athens* (xii and xiii).

DAMP, vapour or mist, and hence moisture. In the vocabulary of coal miners 'firedamp' is marsh gas, which, when mixed with air and exploded, produces 'choke damp', 'after damp' or 'suffocating damp' (carbon dioxide). 'Bluck damp' consists of accumulations of irrespirable gases, mostly nitrogen, which cause the lights to burn dimly, and the term 'white damp' is sometimes applied to carbon monoxide. As a verb, the word means to stifle or check, hence damped vibrations or oscillations are those which have been reduced or stopped, instead of being allowed to die out naturally, the 'dampers' of the piano are small pieces of felt covered wood which fall upon the strings and stop their vibrations as the keys rise, and the 'damper' of a chimney or flue, by restricting the draught, lessens the rate of combustion.

DAMPIER, WILLIAM (1652-1715), English buccaneer, navigator and hydrographer, was born at East Coker, Somersetshire, in 1652. Having early become an orphan, he was placed with the master of a ship at Weymouth, in which he made a voyage to Newfoundland. On his return he sailed to Bantam in the East Indies. He served in 1673 in the Dutch War under Sir Edward Sprague, and was present at two engagements (May 28, June 4), but then fell sick and was put ashore. In 1674 he became an under-manager of a Jamaica estate, but continued only a short time in this situation. He afterwards engaged in the coasting trade, and thus acquired an accurate knowledge of all the ports and bays of the island. He made two voyages to the Bay of Campeachy (1675-76), and remained for some time with the logwood cutters, varying this occupation with buccaneering. In 1678 he returned to England, again visiting Jamaica in 1679 and joining a party of buccaneers, with whom he crossed the Isthmus of Darien, spent the year 1680 on the Peruvian coast, and sacking, plundering and burning, made his way down to Juan Fernandez island. After serving with another privateering expedition in the Spanish Main, he went to Virginia and engaged with a captain named Cok for a privateering voyage against the Spaniards in the South Seas. They sailed in Aug. 1683, touched at the Guinea coast, and then proceeded round Cape Horn into the Pacific. Having touched at Juan Fernandez, they made the coast of South America, cruising along Chile and Peru. They took some prizes, and with these they proceeded to the Galapagos islands and to Mexico, falling in with the latter near Cape Blanco. While they lay here Captain Cook died, and the command devolved on Captain Davis, who, with several other pirate vessels, English and French, raided the west

American shores for the next year, attacking Guryaque, Puchla, Nova, etc. At last Dampier, leaving Davis, went on board *Swan* ship, and proceeded with him along the northern parts of Mexico as far as southern California. *Swan* then proposed, as the expedition met with 'bad success' on the Mexican coast, to run across the Pacific and return by the East Indies. They started from Cape Corrientes on March 31, 1686, and reached Guam in the Ladroneas on May 20, the men, having come almost to an end of their rations, had decided to kill and eat their leaders next, beginning with the 'lusty and fleshy' *Swan*. After six months' drunkenness and debauchery in the Philippines, the majority of the crew, including Dampier, left *Swan* and thirty six others behind in Manila, crossed (1687-1688) from Manila to Pulo Condore, from the latter to China and from China to the Spice Islands and New Holland (the Australian mainland). In March 1688 they were off Sumatra, and in May off the Nicobars, where Dampier was marooned (at his own request, as he declares, for the purpose of establishing a trade in ambergris) with two other Englishmen, a Portuguese and some Malays. He and his companions contrived to rig a canoe to Achin in Sumatra, but the rigging and distress of the voyage proved fatal to several and nearly carried off Dampier himself. After making several voyages to different places of the East Indies (Tongking, Madras, etc.), he acted for some time, and apparently somewhat unwillingly, as gunner to the English fort of Benkulen. Thence he ultimately contrived to return to England in 1691.

In 1699 he was sent out by the English Admiralty in command of the 'Roebuck,' especially designed for discovery in and around Australia. He sailed from the Downs on Jan. 14, with twenty months' provisions, touched at the Canaries, Cape Verde and Bahia, and ran from Brazil round the Cape of Good Hope direct to Australia, whose west coast he reached on July 26, in about 26° S. Anchoring in Shark's Bay, he began a careful exploration of the neighbouring shore lands, but found no good harbour or estuary, no fresh water or provisions. In September, accordingly, he left Australia, recruited and refitted at Timor, and thence made for New Guinea, where he arrived on Dec. 3. By sailing along its easternmost extremity, he discovered that it was terminated by an island, which he named New Britain (now New Pommern), whose north, south and east coasts he surveyed. That St. George's bay was really St. George's channel, dividing the island into two, was not perceived by Dampier, it was the discovery of his successor, Philip Carteret. Nor did Dampier visit the west coast of New Britain or realize its small extent on that side. He was prevented from prosecuting his discoveries by the discontent of his men and the state of his ship. In May 1700 he was again at Timor, and thence he proceeded homeward by Batavia (July 4-Oct. 17) and the Cape of Good Hope. In February 1701 he arrived off Ascension island, when the vessel foundered (Feb. 21-24), the crew reaching land and staying in the island till April 3, when they were conveyed to England by some East Indian men and warships bound for home. In 1703-1707 Dampier commanded two Government privateers on an expedition to the South Seas with grievous unsuccess, better fortune attended him on his last voyage, as pilot to Woodes Rogers in the circumnavigation of 1708-1711. On the former venture Alexander Selkirk, the master of one of the vessels, was marooned at Juan Fernandez, on the latter Selkirk was rescued and a profit of nearly £200,000 was made. But four years before the prize money was paid Dampier died (March 1715) in St. Stephen's parish, Coleman street, London. Dampier's accounts of his voyages are famous. He had a genius for observation, especially of the scientific phenomena affecting a seaman's life, his style is usually admirable—easy, clear and manly. His knowledge of natural history, though not scientific, appears surprisingly accurate and trustworthy. (C. R. B.)

See Dampier's *New Voyage Round the World* (1697), his *Voyages and Descriptions* (1699), a work supplementary to the *New Voyage*, his *Voyage to New Holland* in 1699 (1703, 1709), *Dampier's Voyages* (ed. J. Massfield, 1906), W. C. Russell, *William Dampier* ('English Men of Action,' 1880), also Funnell's *Narrative of the Voyage of 1703-1707*, Dampier's *Vindication* of his *Voyage* (1707), Welbe's *Answer to Captain Dampier's Vindication*, Woodes Rogers, *Circling Voyage Round the World* (1712).

DAMROSCH, LEOPOLD (1832-1885) German American musician and conductor, born in Posen, Prussia, Oct. 2, 1832. In early life a physician, he became *Konzertmeister* at Weimar, then conductor of the Philharmonic society at Breslau, he went to the United States as conductor at the Metropolitan Opera house and founded the Oratorio society, New York city, 1874, the New York Symphony society, 1878, etc.

His son, **WALTER JOHANNES DAMROSCH** (1862-1950), U.S. musician and conductor, was born at Breslau, Ger., Jan. 30, 1862. He went to the U.S. in 1871, and ten years later began his career as conductor in Newark, N.J. On the death of his father in 1885 he was appointed conductor of the Metropolitan Opera house, the New York Symphony society and the Oratorio society.

In 1894 he founded the Damrosch Opera company for producing Wagner and in 1896 produced Wagner's *Parsifal* in concert form for the first time in the United States. In 1903 he was appointed director of the New York Symphony orchestra, remaining conductor until Feb. 1927. He was then appointed musical adviser to the National Broadcasting company, informal lectures on Wagner with music having developed into lecture recitals over the radio. He also founded the NBC "Music Appreciation Hour."

His compositions include *The Scarlet Letter* (1894), *Cyano* (1913), *The Man without a Country* (1936) and *The Opera Cloak* (1942)—all operas, also music for Euripides' *Medea* and *Iphigenia in Aulis* (Berkeley, 1915) and Sophocles' *Electra* (1917). He wrote an autobiography, *My Musical Life* (1923).

Walter Damrosch, who was elected president of the American Academy of Arts and Letters in 1940, died at New York city Dec. 22, 1950.

Another son of Leopold Damrosch, **FRANK HEINO DAMROSCH** (1859-1937), was born at Breslau. He became in 1905 director of the Institute of Musical Art, New York city, and wrote a *Popular Method of Sight Singing and Some Essentials in the Teaching of Music*.

DAMS. Dams are barriers built across a stream for the purpose of diverting the flow, of creating a head of water for the development of power or for storing water. Storage may be used to create a constant-level pond to be used for recreation and other purposes, or to store water during periods of excess flow to be drawn out later for power, irrigation or domestic use during times of insufficient natural flow, or to store flood waters in order to reduce the flood hazard in populated places below the dam.

From immemorial times dams have been constructed of earth and masonry for the purpose of forming reservoirs for the storage of water to ensure regular supplies to communities for domestic purposes and for irrigation. There are records of a huge earthen dam on the Digris and a large masonry dam on the river Nile, built almost in prehistoric times, which remained in service for incredibly long periods, and the Romans built numerous massive masonry dams in Italy and northern Africa. All the early masonry dams were characterized by excessive width of base, usually three to four times the height.

The production of hydroelectric energy and the application of irrigation on a large scale—two forms of development which expanded very rapidly in the 20th century in countries having the

requisite conditions and resources—in many cases involved enormously greater storage of water than that required for even the largest towns.

The progress in scientific design and in magnitude of dam structures was correspondingly extensive and new types of structures were introduced to meet the call for greater economy in a class of work which had seldom been cheap.

TYPES OF DAMS

The principal types are

- 1 Earth dams
- 2 Rock fill dams
- 3 Solid masonry gravity dams
- 4 Hollow masonry gravity dams
- 5 Steel dams
- 6 Timber dams
- 7 Arch dams

While the first three types have been used from antiquity, the others are products of the 19th and 20th centuries. The type and height of a dam, which is adapted to a particular site, depends upon the geology and configuration of the site, the purpose for which it is to be used and its relative cost as affected by, among other things, the availability of construction materials. All types except steel and timber are considered permanent if well constructed, requiring practically no maintenance.

Earth Dams. This type consists of an embankment composed entirely of earth, brought in and compacted or sluiced into position. It is adaptable to places where ample suitable earth materials are available and where a place is convenient to provide a spillway to pass flood waters. It is also adaptable to sites where the foundation is not suitable for a high masonry dam.

Security for earth dams depends on the following:

1 Ample spillway capacity is essential because much water, pressing over the top of an earth dam, will invariably scour a passage sufficiently large to empty the reservoir quickly. Spillways consist of chutes constructed adjacent to the dam to lower flood waters harmlessly to the lower river level.

2 Leakage, through or under the dam, must be reduced to an amount which will not move the materials of which the dam or foundation is composed. If watertightness is not inherent in the materials of the dam and foundation, a continuous impervious earth core, extended to impervious foundation, is provided. Cores of concrete were not used to any extent after about 1920. Drains under the dam consisting of filter blankets or other means are used frequently to collect and dispose of leakage harmlessly.

3 The slopes of the dam must be flat enough to prevent sloughing of the dam or overstressing the foundation. The required slopes depend entirely upon the nature of the materials, the weaker materials requiring the flatter slopes.

4 The downstream slope must be protected from rainwash and the upstream slope from damage by waves. Grass or gravel is used on the downstream slope and a layer of rock fragments, called "riprap," or a slab of concrete is used on the upstream slope.

Earth dams are constructed either by the rolled fill or the hydraulic-fill methods. For the former, the material is placed in

AMONG THE WORLD'S LARGEST DAMS

1 Grand Coulee dam, Columbia river Washington, gravity type masonry dam

2 Fort Peck dam, Missouri river Montana hydraulic-fill type earth dam

3 Shasta dam Sacramento river California, gravity type curved concrete dam

4 Hoover dam Colorado river on the border of Arizona and Nevada,

the dam in layers, each layer being well compacted by special rollers, for the latter, the material is hauled or sluiced to the dam and washed into place, the fires depositing in the centre

Fig 1 shows a cross section of the Anderson Ranch rolled fill earth dam in Idaho

The Fort Peck hydraulic fill earth dam, on the Missouri river in Montana, was still the largest dam in the world at mid 20th century, containing 109,000,000 cu yd of earth. Four large dredges were built at the dam for purposes of dredging material from the valley bottom and pumping it into place on the dam through steel pipe lines 28 in in diameter and 5 mi long at certain stages of construction

When more than 95% of the fill was completed, a considerable movement of the material in the upstream face of the dam occurred near the east abutment, involving approximately 5,000,000 cu yd of fill. The damaged portion was entirely removed and rebuilt, causing a delay of more than a year in completion of the structure

Fort Peck's storage of 19,500,000 ac ft of water was exceeded at mid century only by Lake Mead, the storage reservoir created by Hoover dam in Nevada and Arizona

Rock Fill Dams—Rock fill dams are embankments composed of rock fragments of quarry run sizes up to as large as can be economically handled and dumped into place. Large quantities of water are applied during the dumping operations to ensure necessary initial settlement and compaction

For the same reason given for earth dams, a separate spillway is required. It is usually cut into the rock formation alongside the rock fill and the stone from its excavation used in the dam. Rock fill dams compete with earth dams only if rock is available close by

Watertightness may be obtained by a thin central core of impervious earth, by an upstream impervious earth blanket or by a reinforced concrete slab placed on the upstream face. The concrete slab must be well built to withstand settlement, as it sometimes cracks from that cause

Compared with an earth dam, the slopes of rock fill dams are much steeper. When an upstream earth blanket or a concrete slab is used, the slopes are usually those which the material will take when dumped into place, which is about 1 3 to 1 4 horizontally to 1 vertically. When a central earth core is used, the downstream slope is slightly flatter. The upstream impervious blanket is designed with a slope as prescribed for earth dams, or if steeper, it must be supported by additional rock fill upstream from it

The foundation for a rock fill dam must be free from possible settlement and, in addition, if a concrete slab is used for watertightness, must be resistant to scour from possible considerable leakage caused by cracks

Requirements for stability are practically the same as those described below for sliding of gravity dams

Fig 2 is a cross section of the 345 ft Salt Springs dam in California, the highest of its type yet constructed at mid-20th century. The concrete slab was placed on a layer of, hand or derrick-placed dry rubble to provide greater support

In spite of this provision, some cracking of the concrete occurred requiring emptying of the reservoir for repairs which were successful

Solid Masonry Gravity Dams—Masonry dams built in the first half of the 20th century

FIG 2—CROSS SECTION OF SALT SPRINGS DAM, CALIFORNIA

were almost invariably composed of plain concrete masonry with out steel reinforcement. A typical cross section is shown in fig 3. These dams have a vertical or very slightly battered upstream face. The forces tending to move the dam are water pressure, silt pressure if in the reservoir against the dam, ice pressure from surface ice on the reservoir, earthquake and the buoyant effect of water seeping through the dam and its foundation

They rely for stability on their weight, plus the vertical component of water pressure on the upstream face, to resist overturning or sliding, although the strength and roughness of the foundation also have an important influence on stability. The bases of excessively high dams must be spread to keep the compressive stresses within safe limits

Though dams of massive masonry had been used for thousands of years it was not until the 19th century that a proper scientific basis for design was developed by W J M Rankine and others so that the width could be reduced from three to four times the height to something less than the height

This type of dam is adaptable to most any site, except that it requires a rock foundation for heights above about 65 ft

A grout curtain, consisting of holes drilled in the foundation at the upstream side of the dam and filled with grout under pressure, is used for high dams to prevent too much leakage through the foundation and to reduce the uplift pressure on the base. In order to reduce the uplift pressure further, drainage holes are then drilled just downstream from the grout curtain

FIG 3—CROSS SECTION OF FONTANA DAM, NORTH CAROLINA

The requirements for stability are as follows:

1. There shall be no tension in any horizontal plane. This requires that the resultant of all forces at and above the plane must intersect the plane within the middle third.
2. The frictional and shearing resistance shall be sufficient to prevent sliding.
3. The compressive stresses shall be within safe limits.

To reduce the tendency of concrete in large dams to crack because of shrinkage when cooling, modern practice requires (1) the least amount of cement in the concrete consistent with required strength and durability, (2) construction lifts not in excess of about four or five feet, and (3) cooling the concrete to reduce the temperature after placement.

The concrete may be cooled before or after it is placed in the dam.

Flood waters are allowed to pass over the top of gravity dams, the spillway portion being at a lower elevation and shaped to allow the water to pass over it with the least disturbance.

Stilling basins are frequently provided at the bottom of high spillways of all types in order to reduce the amount of scour of the foundation.

Sometimes dams of this type are arched upstream in plan in order to fit the contours of the site, but, because of their rigidity, very little of the load can be carried by arch action (see *Arch Dams*, below), except possibly after incipient failure has occurred. The highest dam of this type at mid 20th century was the Hoover dam, towering 726 ft above the canyon floor, and the highest dam of any type in the world yet constructed. Originally proposed as a concrete horizontal arch, the dam was finally built as a solid concrete gravity type, curved in plan. Its crest length is 1,282 ft. Built for flood control, irrigation and power development, it creates storage of more than 30,000,000 ac ft of water and will produce about 4,330,000,000 kw hr of firm power annually.

The Grand Coulee dam in Washington, although only 550 ft high, contains 10,585,000 cu yd of concrete and was the largest

BY COURTESY OF F. A. HARTLEY

FIG. 4—PLAN OF LAKE PLEASANT ARIZONA MULTIPLE ARCH DAM SHOWING ABOVE ELEVATION OF HIGHEST BUTTRESS AND BELOW A SECTION THROUGH THE ARCHES AND HOLLOW BUTTRESSES

masonry structure in the world at mid century. It contains more than seven times as much masonry as the great Cheops pyramid in Egypt. Its spillway is capable of passing a flood of 1,000,000 cu ft per second, which would create a fall of water five times the average flow of Niagara falls and three times as high. Assisting materially in flood control and river regulation, Grand Coulee dam creates a storage capacity of 9,610,000 ac ft, to produce more than 8,100,000,000 kw hr of firm power annually.

Hollow Masonry Gravity Dams—Dams of this type are composed of multiple concrete buttresses (some are stone masonry in Europe) to which the water load is carried by a deck composed of cellular reinforced concrete slabs or arches in the upstream face, as shown in fig. 4. The former type is sometimes called the "Am bursen" dam and its buttresses are spaced from 18 ft to 30 ft centres. The latter type is called the "multiple arch" dam, and its buttresses have been spaced from 20 ft to 120 ft centres. Another type, called the "round head buttress" dam has buttresses very closely spaced and expanded on the upstream side an amount sufficient to contact adjacent buttresses, requiring no deck.

Where such dams are used for spillways, a reinforced concrete slab is placed also on the downstream face to support the spilling

FIG. 5—CROSS SECTION OF THE TIRSO DAM, SARDINIA

water. Hydroelectric plants are sometimes placed within hollow dams.

This type of dam is designed under the same theories as those described for solid masonry gravity dams, but they contain only about 35% to 40% as much concrete. The upstream face is inclined usually about 45° and therefore provides a much larger vertical component of water pressure to assist stability than does the solid concrete type. For this reason, less weight of masonry is required.

However, because they require steel reinforcement, more form work and more skilled labour in their construction, they are more expensive per cubic yard of content. They have an advantage over solid masonry gravity dams only where the ingredients for concrete are expensive and where lumber for forms and skilled labour are relatively cheap.

The Bartlett dam in Arizona, 287 ft high, was the highest of this type in the world at mid-20th century. This dam has one unique feature in that the buttresses are of cellular construction, with double walls, to increase their stiffness.

Fig. 5 shows a cross section of the Tirso dam in Sardinia, 200 ft high, the highest hollow dam in Europe at mid century. Its unique features are stone masonry buttresses and a hydroelectric plant between buttresses.

Steel and Timber Dams—Mention should be made of the relatively less important dams of steel and timber, both of which are designed as previously described for hollow dams. The steel dam is in general similar to the buttressed hollow dams, but the deck is steel plate and the buttresses are steel frames.

Few steel dams have been built, probably because of lack of confidence in their permanence. Three large steel dams were constructed about 1900, but after one of these failed, although its destruction was attributed to a foundation failure and not in any way connected with the fact that it was built of steel, it was replaced by a concrete dam.

Timber dams are usually of the same shape but are frequently composed of rock-filled cribs with timber decks. They are numerous but usually quite small because, although they may last more than 50 years, they require very considerable maintenance and are seldom very tight after a few years of use. They are used frequently as cofferdams to unwear construction work.

Arch Dams—The arch dam does not rely upon its weight for stability, but is designed to carry the water load directly to the abutments by horizontal arch action. However, that part of the

dam which is in contact with the bottom of the gorge alters this tendency, and part of the water load is resisted by vertical cantilever action. This combined action produces stresses which are exceedingly complicated and can be computed only by the "trial load" method of analysis. However, that method requires the work of several men for a number of weeks to complete and, for that reason, is used only for the most important projects. Others are designed by shorter and more conservative methods.

Ach dams are relatively rare because sites at which the length of the dam would be small in proportion to its height, and are therefore adaptable to their use, are not frequently available. They are usually the cheapest type of dam where the site is suitable for their use. The Matijah dam in California is an example of this type of dam.

The highest dam of this type at mid 20th century, constructed in 1934, was the Sautet dam on the Drac river, a tributary of the Rhone river, with a maximum height of 414 ft., thickness varying irregularly from 8 ft. at the top to 56 ft. at the bottom and radius of the water face varying from 230 ft. at the top to about 85 ft. at the bottom.

FLOOD GATES

Special circumstances arise in regard to dams on large rivers, whether installed for purposes of irrigation or for the generation of hydroelectric power. It is generally necessary to control within close limits the flood and backing up height above the dam, so that provision must be made for passing very large volumes of flood water. The circumstances are accentuated where a large part of the wet season flow of a river carrying much silt has to be stored to give a regulated supply during the dry season. For all such cases movable openings are necessary on a scale commensurate with the flood or maximum flow conditions, and where close regulation is essential a series of large steel gates, usually of such weight as must be operated by machinery, are most commonly used. The Aswan dam on the Nile has a length across the river of 6,400 ft with a maximum height of 175 ft and forms an irrigation storage reservoir with a capacity of more than 4,000,000 ac ft.

The Dneprostroi dam on the Dnieper river, built for the soviet government, was at mid century the largest low head dam in the world constructed for hydroelectric power purposes. Gate and spillway arrangements were provided on a scale sufficient to pass a flood of 1,250,000 cu ft per second. Power can be developed up to 560,000 kw.

For the extreme case of a river transporting great quantities of silt where the dam must not be allowed to become a trap for the settlement and accumulation of large quantities of material brought down during high floods, a continuous series of gates is used extending from bank to bank and having their sills at the river bed. The gates are separated by piers, usually of concrete, which must be capable of supporting the maximum water load from a panel of the dam as well as the erections and machinery for operating the gates. The gates are fully opened to pass the first part of the wet season flood and scour the reservoir bed clean, and closed in time to conserve the later and cleaner part of the flow.

The Vaal river dam, U. of S. A., is an interesting example of this type of dam, on a river whose annual silt burden is estimated at 1,300,000 tons and maximum flood flow 187,000 cu ft per second.

DAN, a tribe of Israel named after a son of Jacob and Bilhah, the maid of Rachel. The earlier home of the tribe was to the west of Judah, where it seems that they occupied the sea coast, covering the caravan routes, where the weakness of the later kings of the Egyptian 18th dynasty made it possible for them freely to plunder travellers (Judges v. 17, Gen. xix.). The Philistine settlements naturally came into contact first with this tribe, and in the days of Samson their territory was reduced to small compass, embracing only the neighbouring villages of Zorah and Eshtaol. The story of Samson gives us traditions of the struggle which ended in the

expulsion of the Danites. In Judges xvii. seq. we have the narrative of their migration to a new site in the far north. This was their home during the whole period of the northern monarchy, and their settlement centred round one of the most famous sanctuaries in Israel. The fact that several of the famous Israelite artists (especially in metal) are connected with the tribe of Dan (cf. e.g., Exodus xxxi. 6, II Chron. i. 13, seq.) has suggested that early tradition connected Dan with the Canaanites and Kenites.

In the monarchic period the importance of Dan is almost entirely religious. It was a home of bull worship, and tradition ascribes the introduction of this cult to Jeroboam I. (I Ki. xii. 28-30), but the shrine is far older, and its priesthood traced its descent from Moses himself (Judges xviii. 30). Dan was subsequently either regarded as the embodiment of wickedness or entirely ignored (the list of the redeemed in Rev. vii. 5-8 omits the tribe of Dan altogether). Late speculation that the Antichrist should spring from it appears to be based upon an interpretation of Gen. xlix. 17.

DAN, a light skinned patrilineal people, (formerly cannibal) sometimes known as the Jul' cannibals, on the French Ivory coast and in Liberia in the basin of the upper Kavalu. The villages are independent. Family property is joint with individual ownership of person or possessions. They practise husbandry and arboriculture (millet, yam, kola, coco nut oil and rubber). They are animists and practise ordeal by poison and by boiling oil.

See M. S. Vendere, "Ethnographie du Cercle de Man, Cote d'Ivoire," *Revue Ethn. et Trad.* 1909 (1924).

DAN, a town which marked the northern limit of Palestine reckoned "from Dan to Beersheba." It is now identified with Tell el-Kadi, a mound 4 m. west of Banias, in a jungle of rank vegetation. From its western base issues a mighty fountain (Leddian), the largest of the sources of the Jordan. Laish, or Leshem (Judges xviii.), was its name prior to its conquest by migrating Danites and it formed, seemingly, a colony or dependence of Sidon. Here the Danites set up Micah's graven image (Judges xviii. 30f.), and Jeroboam erected one of his golden calves (I Ki. xii. 29). Its name disappears from history with its capture by Ben Hadad of Damascus (I Ki. xv. 20). An attempt has been made to locate Dan at Banias based on a direct statement of Theodore and a vague allusion of the Jerusalem Talmud, but it has against it the definite testimony of Josephus (*Antiq.* i. 10. 1 etc.) and that of Eusebius and Jerome (*Onom. Sac.*) as well as the evidence from the survival of the name (both Dan and Kadhi signify judge). Tell el Kadi is now in British Mandated Territory. A preliminary survey of the mound for excavation purposes has been made since the World War.

DANA, CHARLES ANDERSON (1819-1897), American journalist, was born in Hinsdale, N.H., on Aug. 8, 1819. In 1839 he entered Harvard, but the impairment of his eyesight in 1841 forced him to leave college. From Sept. 1841 until March 1846 he lived at Brook Farm (q.v.), where he was made one of the trustees. He had previously written for the *Harbinger*, the Brook Farm organ, and had written as early as 1844 for the Boston *Chronotype*. In 1847 he joined the staff of the New York *Tribune*, and in 1848 he wrote from Europe letters to it on the revolutionary movements of that year. Returning to the *Tribune* in 1849, he became its managing editor, and in this capacity actively promoted the anti-slavery cause. In 1867 his resignation was asked for, apparently because of wide temperamental differences between him and Greeley. Secretary of war Stanton immediately made him a special investigating agent of the war department, in this capacity Dana spent much time at the front, and sent to Stanton frequent reports. He went through the Vicksburg campaign and was at Chickamauga and Chattanooga, and urged the placing of Gen. Grant in supreme command of all the armies in the field. In 1864-65 Dana was second assistant secretary of war. He became the editor and part owner of the New York *Sun* in 1868, and remained in control of it until his death. Under Dana's control the *Sun* opposed the impeachment of President Johnson, it supported Grant for the presidency in 1868, it was a sharp critic of Grover Cleveland, and in 1872 took part in the Liberal Republican

revolt and urged Greeley's nomination. It favoured Tilden the Democratic candidate for the presidency, in 1876, opposed the Electoral Commission and continually referred to Hayes as the 'fraud president'. In 1884 it supported Benjamin T. Butler, the candidate of Greenback Labor and Anti Monopolist parties, for the presidency, and opposed Blaine (Republican) and even more bitterly Cleveland (Democrat), it supported Cleveland and opposed Harrison in 1888, and in 1890, on the free silver issue, it opposed Bryan, the Democratic candidate for the presidency. Dana's literary style came to be the style of the *Sun*—simple, strong, clear, "boiled down" *The Art of Newspaper Making*, containing lectures which he wrote on journalism, was published in 1900. With George Ripley he edited *The New American Cyclopaedia* (1857-63), reissued as the *American Cyclopaedia* in 1873-76. He edited an anthology, *The Household Book of Poetry* (1857). Dana's *Reminiscences of the Civil War* was published in 1898, as was his *Eastern Journeys, Notes of Travel*. He died at Glen Cove, Long Island, N.Y., on Oct. 17, 1897.

See James Wilson, *The Life of Charles A. Dana* (1907), and Frank M. O'Brien, *The Story of the "Sun," New York, 1833-1918* (1918).

DANA, FRANCIS (1743-1811), American jurist, was born in Charlestown (Mass.), June 13, 1743. He graduated at Harvard in 1761, was admitted to the bar in 1767, became a leader of the Sons of Liberty, and in 1774 was a member of the first provincial congress of Massachusetts. He was a member of the Massachusetts Executive Council (1776-80) and a delegate to the Continental Congress (1776-78). In the autumn of 1779 he was appointed secretary to John Adams, who had been selected as minister plenipotentiary to negotiate treaties of peace and commerce with Great Britain, and in Dec. 1780 he was appointed diplomatic representative to the Russian Government. He remained at St. Petersburg from 1781 to 1783, but was never formally received by the empress Catherine. In 1784 he was again chosen a delegate to Congress, and in 1785 he became a justice of the Massachusetts supreme court, over which he presided (1791-1806) with ability and distinction. He was an earnest advocate of the adoption of the Federal constitution, was a member of the Massachusetts convention which ratified that instrument and was one of the most influential advisers of the leaders of the Federalist party. He died at Cambridge (Mass.), April 25, 1811.

His son, **RICHARD HENRY DANA** (1787-1879), was born in Cambridge (Mass.), Nov. 15, 1787. After graduation from Harvard in 1808 he was admitted to the bar, but literature was his absorbing interest. From 1815 until 1821 he was associated with Jared Sparks and Edward T. Channing in the editorial control of the *North American Review*, and in 1821-22 he put forth a miscellany, *The Idle Man*. He published his first volume of *Poems* in 1827, and in 1833 appeared his *Poems and Prose Writings*, republished in 1850 in two volumes. An English edition, *The Buccaneer and Other Poems*, was issued in 1844. Dana died in Boston, Feb. 2, 1879.

RICHARD HENRY DANA (1815-1882), son of the last mentioned, was born in Cambridge (Mass.), Aug. 1, 1815. He entered Harvard in the class of 1835, but an illness affecting his sight necessitated a suspension of his college work, and in Aug. 1834 he shipped before the mast for California, returning in Sept. 1836. This voyage was really a turning point in his career, renewing his health, turning him into a self-reliant, energetic man with broad interests and keen sympathies, and giving him the material for his *Two Years before the Mast* (1840), one of the best American books on the sea. Not only is this still widely read at home and abroad, but it also has historic significance. It created interest in California prior to the gold rush, with Melville's *White Jacket* (1850) it led to reforms in the treatment of sailors, and it vividly preserves a bygone epoch. Before the publication of his book, Dana had completed his legal training at Harvard, and he now began the practice of law, his former experience immediately bringing him a large number of maritime cases. In 1841 he published *The Seaman's Friend*, republished in England as *The Seaman's Manual*, a useful and readable book. In spite of the ostracism and danger

it involved, Dana became prominently associated in 1848, with the Free Soil movement and volunteered his services for negroes seized under the Fugitive Slave Act. In 1857 he became a regular attendant at the meetings of the famous Boston Saturday club, to the members of which he dedicated his account of a vacation trip, *To Cuba and Back* (1859). He returned to America from a trip round the world in time to participate in the presidential campaign of 1860 and after Lincoln's inauguration he was appointed United States district attorney for Massachusetts. In this office in 1863 he won before the Supreme Court of the United States the famous prize case of the "Amy Warwick," on the decision in which depended the right of the Government to blockade the Confederate ports without giving the Confederate States an international status as belligerents. He brought out in 1865 an edition of Wheaton's *International Law*, his notes constituting a most learned and valuable authority on this subject and its bearings on American history and diplomacy, but Dana was charged by the editor of two earlier editions, William Bench Lawrence, with infringing his copyright, and was involved in litigation for 13 years. Dana's political aspirations were largely frustrated. He declined the position of United States district judge, but he became a member of the Massachusetts house of representatives (1867-68), and in 1867 was re-elected, with William M. Everts, to prosecute Jefferson Davis, whose admission to bail he counselled. Although the Senate refused to ratify Grant's nomination of him for minister to England, he was, in 1877, one of the counsel for the United States before the commission that met at Halifax, N.S., to arbitrate the fisheries question between the United States and Great Britain. In 1878 he gave up his law practice, and he devoted the rest of his life to study and travel. He died in Rome, Italy, Jan. 6, 1882.

For the elder Richard Henry Dana, see J. G. Wilson, *Brvant and His Friends* (1885). For the younger, see C. F. Adams, *Richard Henry Dana: a Biography* (1890) and *Exercises: Celebrating the One Hundredth Anniversary of the Birth of Richard Henry Dana* (Cambridge, 1916).

DANA, JAMES DWIGHT (1813-1895), American geologist, mineralogist and zoologist, born in Utica, New York, on the 12th of February 1813. He early displayed a taste for science, which had been fostered by Fay Edgerton, a teacher in the Utica high school, and in 1830 he entered Yale College, in order to study under Benjamin Silliman the elder. Graduating in 1833, for the next two years he was teacher of mathematics to midshipmen in the navy, and sailed to the Mediterranean while engaged in his duties. In 1836-37 he was assistant to Professor Silliman in the chemical laboratory at Yale, and then, for four years, acted as mineralogist and geologist of a United States exploring expedition, commanded by Captain Charles Wilkes, in the Pacific ocean (see WILKES, CHARLES). His labours in preparing the reports of his explorations occupied parts of thirteen years after his return to America in 1842. In 1844 he again became a resident of New Haven, married the daughter of Professor Silliman, and in 1850, on the resignation of the latter, was appointed Silliman Professor of Natural History and Geology in Yale College, a position which he held till 1892. In 1846 he became joint editor and during the later years of his life he was chief editor of the *American Journal of Science and Arts* (founded in 1818 by Benjamin Silliman), to which he was a constant contributor, principally of articles on geology and mineralogy. A bibliographical list of his writings shows 214 titles of books and papers, beginning in 1835 with a paper on the conditions of Vesuvius in 1834, and ending with the fourth revised edition (finished in February 1895) of his *Manual of Geology*. His reports on *Zoophytes*, on the *Geology of the Pacific Area*, and on *Crustacea*, summarizing his work on the Wilkes expedition, appeared in 1846, 1849 and 1852-1854, in quarto volumes, with copiously illustrated atlases, but as these were issued in small numbers, his reputation more largely rests upon his *System of Mineralogy* (1837 and subsequent editions), *Manual of Geology* (1862, 4th ed., 1895), *Manual of Mineralogy* (1848), afterward entitled *Manual of Mineralogy and Lithology* (4th ed., 1887), and *Coral and Coral Islands* (1872, 2nd ed., 1890). In 1887 Dana revisited the Hawaiian Islands, and the results of his further investigations were pub-

BALLROOM AND EXHIBITION DANCES

- 1 The Left & Right originated by Vernon and Irene Castle. This dance is a variation of the one step and was popular from 1913 to 1915. It consisted of long walking steps on one's toes moving up and down after striking the beat.
- 2 The Argentine Tango was popular between 1914 and 1916 but was later replaced by the French Tango. Photograph shows Ricardo Cortez and Dolores Del Rio.
- 3 The Maxie had a brief popularity as a ballroom dance in 1914. For a year afterwards it was used only as an exhibition dance danced by Ramon and Renita.
- 4 The Lulu Fido, Tuto Polka, Brazilian had a brief vogue between 1914 and 1916. Photograph shows Arthur Murray and partner in the Chinese Tuto.
- 5 There was a lull in dancing after the hectic craze which died down in 1917 until 1926 when the Charleston became popular. Photograph shows Fred Astaire and Ginger Rogers in a characteristic step of the Charleston.
- 6 Tap Dancing Eleanor Powell in a characteristic pose.

ished in a quarto volume in 1890, entitled *Characteristics of Volcanoes*. He was awarded the Copley medal in 1877 by the Royal Society of London, and the Wollaston medal in 1872 by the Geological Society. He was one of the 50 original members of the National Academy of Sciences. He also took an active part in the affairs of Yale college, particularly in the development of the Sheffield Scientific school. He died April 14, 1895.

His son EDWARD SALISBURY DANA, born at New Haven on Nov. 16, 1849, was the author of *A Textbook of Mineralogy* (1877, 4th ed., 1932) and a *Text Book of Elementary Mechanics* (1881). In 1879-80 he was professor of natural philosophy and then was professor of physics at Yale. He died June 17, 1935.

See *Life of J. D. Dana*, by Daniel C. Gilman (1899).

DANAE (Gr. *da nā* anglicized *dan'a-ē*), in Greek legend, daughter of Acrisius, king of Argos. According to the myth, her father, having been warned by an oracle that she would bear a son by whom he would be slain, confined Danae in a brazen tower. But Zeus descended to her in a shower of gold, and she gave birth to Perseus, whereupon Acrisius placed her and her infant in a wooden box and threw them into the sea. They were finally driven ashore on the island of Seriphus, where they were picked up and brought to Polydectes, king of the island. For her subsequent adventures see PERSEUS.

DANAGLA, see BARABRA.

DANAO, a municipality (with administrative centre and 30 *barrios* or districts) of the province and island of Cebu, Philippine islands, on the east coast, at the mouth of the Danao river, 17 mi. NNE of Cebu, the provincial capital. Pop. (1948) 26,461.

Danao is in the centre of a rich agricultural region producing rice, corn, sugar, copra and cacao. Coal is mined in the vicinity.

According to the census of 1939, there were 3,700 farms in Danao, 1,289 of which were farmed by the owners, 907 by part owners, 903 by share tenants and one cash tenant. The vernacular is Cebuano.

DANAEUS, in Greek legend, son of Belus, king of Egypt, and twin brother of Aegyptus. He was born at Chemmis (Panopolis) in Egypt, but having been driven out by his brother he fled with his 50 daughters to Argos, the home of his ancestors. Lo. The 50 sons of Aegyptus arrived in Argos, and Danaus was obliged to consent to their marriage with his daughters. But to each of these he gave a knife with injunctions to slay her husband on the marriage night. They all obeyed except Hypermetra, who spared Lynceus. She was brought to trial by her father, acquitted and afterward married to her lover. Being unable to find suitors for the other daughters, Danaus offered them in marriage to the youths of the district who proved themselves victorious in racing contests (Pindar, *Pythia*, ix. 117).

According to another story Lynceus slew Danaus and his daughters and seized the throne of Argos (schol. on Euripides, *Hecuba*, 886). In the other world the Danaides were condemned to the endless task of filling with water a vessel which had no bottom. Crime and punishment alike have been variously explained by mythologists.

See articles in Pauly-Wissowa's *Realencyklopädie* and W. H. Roscher's *Lexikon der Mythologie*, Campbell Bonner, in *Harvard Studies*, xiii (1902).

DANBURITE, a rare mineral species consisting of calcium and boron orthosilicate, $\text{Ca}_2\text{B}(\text{SiO}_4)_2$, crystallizing in the orthorhombic system and discovered in 1839 at Danbury, Conn., whence its name, and where it occurs embedded in dolomite. The crystals are transparent to translucent, and colourless to pale yellow, they are prismatic in habit, and closely resemble topaz in form and interfacial angles. There is an imperfect cleavage parallel to the basal plane, hardness 7, specific gravity 3.0. Splendid crystals have been found in Japan.

DANBURY, a city of southwestern Connecticut, 65 mi. NNE of New York city, on the Still river, one of the county seats of Fairfield county. It is served by the New York, New Haven and Hartford railroad. The population was 22,067 in 1950 and 22,339 in 1940 by the federal census.

The city lies in a broad plain, surrounded by the foothills of the

Berkshires, and retains much of the delightful aspect of a New England village. It is the seat of a state teachers college, opened 1904. The predominant industry is the manufacture of felt hats begun in 1780. Other important manufactures are hatmaking machinery, silverplated ware, surgical instruments, silk braid, thread, ball and roller bearings, aluminum foil, heating units, electronic instruments, precision tools and artists' brushes. An agricultural fur is an annual event.

Danbury was settled in 1684. The borough was chartered in 1812 and became a city in 1889. In 1766 a depot of military supplies was established there, which in April 1777 was raided by Gov. William Tryon of New York. In his retreat he was attacked at Ridgefield (9 mi. S) by the Americans under Gen. David Wooster, who was fatally wounded in the conflict. Several books about Danbury were written by James Montgomery Bailey (1841-94), founder and for many years proprietor of the *Danbury News*, whose humorous sketches in the *News* made him self and the paper famous.

The "Danbury Hatters' Case" a suit for damages brought by a manufacturing firm against 186 hatters of Danbury in 1902 on the ground that their boycott was a violation of the Sherman Act, is important in the annals of organized labour in America. Damages were awarded to the plaintiffs and his contention was upheld by a decision of the U.S. supreme court in 1908.

DANBY, FRANCIS (1793-1861), landscape painter, was born at Common, near Wexford, Ire., and died at Exmouth, Devon. On being elected A.R.A. in 1825 he settled in London. In 1839, however, he quarrelled with the academy and till 1841 lived by the lake of Geneva. His elder son and pupil, JAMES FRANCIS DANBY (1816-75), specialized in sunrises and sunsets in his father's Turner com Martin style, the younger, THOMAS DANBY (1817-86), tried in his Welsh landscapes to imitate Claude Lorrain.

DANBY, THOMAS OSBORNE, EARL OF SELEDS, THOMAS OSBORNE, 1ST DUKE OF

DANCE, the name of an English family distinguished in architecture, art and the drama. GEORGE DANCE, the elder (1700-68), obtained the appointment of architect to the City of London and designed the Mansion house (1739), the churches of St. Botolph, Aldgate (1741), St. Luke's, Old street, St. Leonard, Shoreditch, the old excise office, Broad street, and other public works of importance. His eldest son, JAMES DANCE (1722-74) was educated at the Merchant Taylors' school and St. John's college, Oxford. He took the name of Love and became an actor and playwright, connected for 12 years with Drury Lane theatre. He wrote a number of comedies—the earliest *Pamela* (1742).

George Dance's third son, SIR NATHANIEL DANCE HOLLAND BART (1735-1811), studied art under Francis Hayman in Italy, where he formed a hopeless attachment for Angelica Kauffman. From Rome he sent home "Dido and Aeneas" (1763). On his return to England he took up portrait painting with great success and contributed to the first exhibition of the Royal Academy, of which he was a foundation member, full length portraits of George III and his queen. These, and his portraits of Capt. James Cook and of Garrick as Richard III, engraved by Dixon, are his best known works. In 1790 he became M.P. for East Grinstead taking the additional name of Holland. He was made a baronet in 1800. George Dance's fifth and youngest son, GEORGE DANCE the younger (1741-1825), succeeded his father as City surveyor and architect in 1768. He had spent several years abroad chiefly in Italy, and had already distinguished himself by designs for Blackfriars bridge. His first important public work was the rebuilding of Newgate prison in 1770. He was a foundation member of the Royal Academy and the "revealed master" of J. John Swane. His son, CHARLES DANCE (1794-1863), was for 30 years registrar, taxing officer and chief clerk of the insolvent debtors court. In collaboration with J. R. Planché and others, or alone, he wrote a great number of extravaganzas, farces and comedies. He was one of the first of the burlesque writers, and was the author of those produced so successfully by Madame Vestris for years at the Olympic.

DANCE Dancing consists in the rhythmical movement of any or all parts of the body in accordance with some scheme of

individual or concerted action which is expressive of emotions or ideas. Amongst primitive peoples it always has some accompaniment by means of which the rhythm is emphasized. In its simplest form this consists in clapping the hands, or beating a drum to mark the time, more elaborate is the accompaniment composed of several drums each with its own rhythm, or of an orchestra of different instruments. Frequently every dance has its own song which is sung by the performers themselves or by the onlookers.

Among primitive peoples the range of movements employed in dancing is very wide. All parts of the body are used, head, back, hips, arms, fingers and even the facial muscles are brought into play as well as the feet. Some performances demand great physical exertion, with leaping and many bodily contortions, as in the war *haka* of the Maori.¹ In others the dancers confine themselves to a monotonous movement of the hands and feet. Many observers have commented on the swiftness and lack of beauty in savage dances but such a condemnation is based upon the misconception that they are performed primarily for the pleasure of the spectator. Spectacular dances are not unknown, but generally the satisfaction of the dancers is of first importance.

Much has been written of the obscenity of primitive dancing and it has even been said that it is primarily sexual in intent. Evidence from many parts of the world does not bear this out. To a certain extent all dancing is sexually stimulating, but, except in courtship dances, this stimulus may be regarded as a by-product. Nor is it true that all primitive dance movements are mimetic. Some are undoubtedly so, as the totemic dances in Australia (see TOTEMISM), but in the Andaman Islands there is no trace of any such significance. Often the movements seem to be artistic renderings of spontaneous actions resulting from some emotional state.

As a rule a dance is performed by a group or groups of people all of whom move in the same way. Solo dances are rare, though not infrequently there is a dance leader who has a special part to play. All the able bodied adults of the community are expected to take part. Usually the sexes are segregated, though this is by no means universal, but the close embrace, customary in European round dances, is seldom countenanced. Sometimes certain dances are restricted to one sex. Unless the dance forms part of a secret ceremony, that section of the community which is not dancing acts as audience, and often performs the accompaniment. Children are seldom allowed to join their elders, but have dances and singing games among themselves.

Under certain conditions some individuals, such as those who are in mourning or in seclusion at puberty, are not allowed to dance. They are in an abnormal state and temporarily cut off from society, and are therefore excluded from dancing, which is essentially a social occupation. It is for this reason too that a dance is so

with a part of the ceremony which terminates a period of isolation, by joining in its performance the individual re-establishes his membership of the group.

"The individual shouts and jumps for joy, the society turns the jump into a dance, the shout into a song." Dancing is a general means of enjoyment, often of rejoicing. But, as indicated above, it is more than this. Consciously or unconsciously it is a means of reaffirming social unity and occurs on all occasions which are so usually important at the close of *Passage Rites* (*q.v.*)—especially those of puberty and death, at the initiation and close of group

¹ Bux, *The Maori*, vol II, pp 102-103

activities such as fighting or the building of a communal house, or during inter group activities such as the tribal corroboree in Australia or the peace-making of the Andamans. The food supply is all-important to the community and thus among an agricultural people, for instance, seed and harvest time have social significance, and are therefore times of dancing.

But except on such occasions as the dance meetings of local groups and the peace making ceremonies of the Andamans the sense of social unity is felt as a pleasurable accompaniment to dancing rather than as its conscious purpose. The significance of the dances to the dancers and their emotional accompaniment have been very insufficiently studied, and there has been much theorizing on little data. Many dances seem to be magical ceremonies by means of which human beings or ritual phenomena are controlled. Thus the dances of the totemic ceremonies of central Australia are performed to promote the fertility of the animal species concerned, and many hunting and war dances appear to be intended to influence the hunted game or the enemy, so they may be readily killed. The actions in such dances are mostly mimetic, and it is not uncommon for performers at important ceremonies to be killed if they make any mistake, probably because it is felt that such faults would detract from the efficacy of the dance. Accuracy of movement like accuracy of words is essential to the success of magical rites. From the way in which a dance is performed omens are frequently taken, any mistake or want of spirit being accounted evil.

CHINESE BOY IN COS-
TUME FOR DEVIL DANCE

The border line between magic and religion is notoriously difficult to draw, but among some people dancing seems definitely to be a form of religious exercise akin to prayer.

Dancing as an incident in courtship is found among many species of birds and animals. In all dancing there is an opportunity for pleasurable exercise, but some dances are designed to create sexual excitement in both performers and onlookers. Thus in Torres Straits, the unmarried girls watch the bachelors dancing, and then each taps on the shoulder the one whom she has chosen, and in Australia the occasional periods of organized sexual licence are led up to by dancing.

Auto intoxication is induced either intentionally or incidentally by dancing, the best known examples of this being the wild excesses of the bacchantes and of the shamans of Siberia, who use dancing as a means of becoming inspired by their tutelary spirit. Similar "possession" is induced by priests among savage peoples, and the power to do this is often a *sine qua non* of priesthood. In a war dance the condition produced is not so extreme, but is akin to this. The warriors work themselves into a frenzy of hatred, and they feel themselves exalted. Though many war dances may have a supposed magical effect on the enemy, this exaltation, this sense of heightened valour, is often one if not the only reason for their performance.

Nothing will survive in any human society unless it has a functional value. Within every individual in a community there is a conflict of desires. On the one hand there is a wish to be outstanding, on the other the longing for a sense of group fellowship. To both these desires dancing at once provides satisfaction. The dancer can display himself to the best advantage and can do so in harmony with others. On certain occasions one or other of these two aspects may be stressed, as, for instance, the individual aspect in dances of courtship, the group aspect in war or peace dances, but, to a greater or less extent, both aspects are always present. Therefore, because dancing is entirely satisfying emotionally, it survives in the savage and civilized world when beliefs in its magical or religious efficacy have passed away.

HISTORY

The term "dancing" in its widest sense includes three things — (1) the spontaneous activity of the muscles under the influence of some strong emotion, such as social joy or religious exaltation, (2) definite combinations of graceful movements performed for the sake of the pleasure which the exercise affords to the dancer or to the spectator, (3) carefully trained movements which are meant by the dancer vividly to represent the actions and passions of other people. In the highest sense it seems to be for prose gesture what song is for the instinctive exclamations of feeling. At a Mexican feast to the god Huitzilopochtli the noblemen and women danced tied together at the hands, and embracing one another the arms being thrown over the neck. This resembles the dance variously known as the Greek Bracelet or Brawl, *Oposos*, or Bearsfeet, but all of them probably are to a certain extent symbolical of the relations between the sexes. In a very old Peruvian dance of ceremony before the Inca, several hundreds of men formed a chain, each taking hold of the hand of the man beyond his immediate neighbour, and the whole body moving forwards and backwards three steps at a time as they approached the throne.

The rude imitative dances of early civilization are of extreme interest. In the same way the dances of the Ostyak tribes (Northern Asia) imitate the habitual sports of the chase and the gambols of the wolf and the bear and other wild beasts, the dancing consisting mainly of sudden leaps and violent turns which exhaust the muscular powers of the whole body. The Kamchadecians, too, in dancing, imitate bears, dogs and birds. The *Kru* dances of the Coast Negroes represent hunting scenes, and on the Congo, before the hunters start, they go through a dance imitating the habits of the gorilla and its movements when attacked. The Damara dance is a mimic representation of the movements of oxen and sheep, four men stooping with their heads in contact and uttering harsh cries. The center of the baboon is the humorous part of the ceremony. The Bushmen dance in long irregular jumps, which they compare to the leaping of a herd of calves, and the Hottentots not only go on all fours to counterfeit the baboon, but they have a dance in which the buzzing of a swarm of bees is represented. The Kennowits in Borneo introduce the mus and the deer for the same purpose. The Australians and Tasmanians in their dances called *corrobories* imitate the frog and the kangaroo (both leaping animals). The hunt of the emu is also performed, a number of men passing slowly round the fire and throwing their arrows about so as to imitate the movements of the animal's head while feeding. The Gonds are fond of dancing the bison hunt, one man with skin and horns taking the part of the animal. Closely allied to these are the mimic fights, almost universal among tribes to which war is one of the great interests of life. The Bravery dance of the Dahomans and the Hoolee of the Bihl tribe in the Vindhya Hills are illustrations. The latter seems to have been reduced to an amusement conducted by professionals who go from village to village,—the battle being engaged in by women with long poles on the one side, and men with short cudgels on the other. There is here an element of comedy, which also appears in the Fiji club dance. This, although no doubt originally suggested by war, is enlivened by the presence of a clown covered with leaves and wearing a mask. The monotonous song accompanying the club dance is by way of commentary or explanation. So, also, in Guatemala there is a public *bale* or dance, in which all the performers, wearing the skins and heads of beasts, go through a mock battle, which always ends in the victory of those wearing the deer's head. At the end the victors truce in the sand with a pole the figure of some animal, and this exhibition is supposed to have some historical reference. But nearly all savage tribes have a regular war dance, in which they appear in fighting costume, handle their weapons, and go through the movements of challenge, conflict, pursuit or defeat. The women generally supply the stimulus of music. There is one very picturesque dance of the Natal Kafirs, which probably refers to the departure of the warriors for the battle. The women appeal plaintively to the men, who slowly withdraw, stamping on the

ground and darting their short spears or *assegais* towards the sky. In Madagascar, when the men are absent on war, the women dance for a great part of the day, believing that this inspires their husbands with courage. In this, however, there may be some religious significance. These war dances are totally distinct from the institution of military drill, which belongs to a later period, when social life has become less impulsive and more reflective. (The Greek *kappaia* represented the surprise by robbers of a warrior ploughing.) The gymnopaedic dances imitated the sterner sports of the palestra.) There can be little doubt that some of the characteristic movements of these primitive hunting and war dances survive in the smooth and ceremonious dances of the present day. But the early mimetic dance was not confined to these two subjects, it embraced the other great events of savage life—the drama of courtship and marriage, the funeral dance, the consecration of labour, the celebration of harvest or vintage, sometimes, too, purely fictitious scenes of dramatic interest, while other dances degenerated into games. (The Greek *Lenaxa* and *Dionysia* had a distinct reference to the seasons.) For instance, in Yucatan one man danced in a cowering attitude round a circle, while another followed hurling at him *bohordos* or darts, which were adroitly caught on a small stick. Again in Tasmanian, the dances of the women describe their "clamber for the opossum, diving for shell fish, digging for roots, nursing children and quizzing with husbands." Another dance, in which a woman by gesture punts a thief with cowardice, gives him an opportunity of coming forward and recounting his courageous deeds in dance. The funeral dance of the Todas (another Indian hill tribe) consists in walking backwards and forwards, without variation, to a howling tune of "hi! hoo!" The meaning of this is obscure, but it can scarcely be solely an outburst of grief. In Dahomey the blacksmiths, carpenters, hunters, braves and bards, with their various tools and instruments, join in a dramatic dance. We may add here a form of dance which is almost precisely equivalent to the spoken incantation. It is used by the professional devil-dancer of the wild Veddahs for the cure of diseases. An offering of eatables is put on a tripod of sticks, and the dancer, decorated with green leaves, goes into a paroxysm of dancing in the midst of which he receives the required information. This, however, rather belongs to the subject of religious dances.

It is impossible here to enumerate either the names or the forms of the sacred dances which formed so prominent a part of the worship of antiquity. After the middle of the 18th century there were still traces of religious dancing in the cathedrals of Spain, Portugal and Roussillon—especially in the Mozarabic Mass of Toledo.

HISTORIC DANCES, 15TH-19TH CENTURY

France and Italy.—Italy, in the 15th century, saw the renaissance of dancing, and France may be said to have been the nursery of the modern art, though comparatively few modern dances are really French in origin. The national dances of other countries were brought to France, studied systematically, and made perfect there. An English or a Bohemian dance, practised only amongst peasants, would be taken to France polished and perfected, and would at last find its way back to its own country, no more recognizable than a piece of elegant cloth when it returns from the printer to the place from which as "grey" material it was sent. The fact that the terminology of dancing is almost entirely French is a sufficient indication of the origin of the rules that govern it.

The earliest dances that bear any relation to the modern art are probably the *dances basses* and *dances hautes* of the 16th century. The *dance basse* was the dance of the court of Charles IX. and of good society, the steps being very grave and dignified, not to say solemn, and the accompaniment a solemn tune. The *dances hautes* or *baladines* had a skipping step, and were practised only by clowns and country people. More lively dances, such as the *Gaillarde* and *Volta* were introduced into France from Italy by Catherine de' Medici, but even in these the interest was chiefly spectacular. Other dances of the same period were the *Branle* (afterwards corrupted to *Braule*, and known in England

as the Brawle)—a kind of generic dance which was capable of an almost infinite amount of variety. Thus there were imitative dances—*Branles mimés*, such as the *Branles des Ermites*, *Branles des flambeaux* and the *Branles des lavandières*. The *Branle* in its original form had steps like the *All-monde*.

Perhaps the most famous and stately dance of this period was the *Pavane* (of Spanish origin), which is very fully described in Tabouret's *Orchésographie*, the earliest work in which a dance is found minutely described. The *Pavane*, which was really more a procession than a dance, must have been a very gorgeous and noble sight, and it was perfectly suited to the dress of the period, the stiff brocades of the ladies and the swords and heavily plumed hats of the gentlemen being displayed in its simple and dignified measures to great advantage.

In the *Pavane* and *Branle*, and in nearly all the dances of the 17th and 18th centuries, the practice of kissing formed a not unimportant part, and seems to have added greatly to the popularity of the *Pavane*. Another extremely popular dance was the *Sara band*, which, however, died out after the 17th century. It was originally a Spanish dance but enjoyed an enormous success for a time in France. Every dance at that time had its own tune or tunes, which were called by its own name, and of the *Saraband* the chevalier de Grammont wrote that "it either charmed or annoyed everyone, for all the guitarists of the court began to learn it, and God only knows the universal twanging that followed." Vauquelin des Yvetaux, in his 80th year, desired to die to the tune of the *Saraband*, "so that his soul might pass away sweetly."

The *Courante* was a court dance performed on tiptoe with slightly jumping steps and many bows and curtsies. The minuet and the waltz were both in some degree derived from it, and it had much in common with the famous *Seguidilla* of Spain. It was a favourite dance of Louis XIV., who was an adept in the art, and it was regarded in his time as of such importance that a noble man's education could hardly have been said to be begun until he had mastered the *Courante*.

The dance which the French brought to the greatest perfection—which many, indeed, regard as the fine flower of art—was the *Minuet*. Its origin, as a rustic dance, is not less antique than that of the other dances from which the modern art has been evolved. It was originally a *branle* of Poitou, derived from the *Courante*. It came to Paris in 1650 and was first set to music by Lully. It was at first a gay and lively dance, but on being brought to court it soon lost its sportive character and became grave and dignified. It is mentioned by Beauchamps, the father of dancing-masters, who flourished in Louis XIV.'s reign, and also by Blondy, his pupil, but it was Pecour who really gave the minuet its popularity, and although it was improved and made perfect by Dauberval, Gardel, and Vestris, it was in Louis XV.'s reign that it saw its golden age. It was then a dance for two in moderate triple time, and was generally followed by the gavotte. Afterwards the minuet was considerably developed, and with the gavotte became chiefly a stage dance and a means of display, but it should be remembered that the *minuets* which are now danced on the stage are generally highly elaborated with a view to their spectacular effect, and have been imported into them steps and figures which do not belong to the minuet at all, but are borrowed from all kinds of other dances. The original court minuet was a grave and simple dance, although it did not retain its simplicity for long. But when it became elaborated it was glorified and moulded into a perfect cultivated and most brilliantly polished. The "languishing eye and smiling mouth" had their due effect in the minuet, it was a school for chivalry, courtesy and ceremony, the hundred slow graceful movements and curtsies, the pauses which had to be filled by neatly turned compliments, the beauty and bravery of attire—all were eloquent of graces and outward refinements which we cannot boast now. The fact that the measure of the minuet has become incorporated in the structure of the symphony shows how important was its place in the polite world.

The *Gavotte*, which was often danced as a pendant to the minuet, was also originally a peasant's dance, a *danse des Gavots*, and consisted chiefly of kissing and capering. It also became stiff and

artificial, and in the later and more prudish half of the 18th century the ladies received bouquets instead of kisses in dancing the gavotte. It rapidly became a stage dance, and it has never been restored to the ballroom. Gretry attempted to revive it, but his arrangement never became popular.

Other dances which were naturalized in France were the *Lesos saise*, popular in 1760, the *Cotton*, fashionable under Charles X., derived from the peasant *branles* and danced by ladies in short skirts, the *Galop*, imported from Germany, the *Lancers*, invented by Laborde in 1836, the *Polka*, brought by a dancing master from Prague in 1840, the *Schottische*, also Bohemian, first introduced in 1844, the *Bourree*, or French clog dance, the *Quadrille*, known in the 18th century as the *Contre danse*, and the *Waltz*, which was danced as a *volte* by Henry III. of France, but only became popular in the beginning of the 19th century. We shall return to the history of some of these later dances in discussing the dances at present in use.

Spain—If France has been the nursery and school of the art of dancing, Spain is its true home. There it is part of the national life, the inevitable expression of the gay, contented, irresponsible, sunburnt nature of the people. The form of Spanish dances has hardly changed, some of them are of great antiquity, and may be traced back with hardly a break to the performances in ancient Rome of the famous dancing-girls of Cadiz. The connection is lost during the period of the Arab invasion, but the art was not neglected, and Jovellanos suggests that it took refuge in Asturias. At any rate, dances of the 10th and 12th centuries have been preserved uncorrupted. The earliest dances known were the *Turdion*, the *Gibidana*, the *Pié de-gibao*, and (later) the *Madama Orleans*, the *Alemána* and the *Pavana*. Under Philip IV. theatrical dancing was in high popularity, and ballets were organized with extraordinary magnificence of decoration and costume. They supplanted the national dances, and the *Zarabanda* and *Chacona* were practically extinct in the 18th century. It is at this period that the famous modern Spanish dances, the *Bolero*, *Seguidilla* and the *Fandango*, first appear.

Of these the *Fandango* is the most important. It is danced by two people in 6-8 time, beginning slowly and tenderly, the rhythm marked by the click of castanets, the snapping of the fingers and the stamping of feet, and the speed gradually increasing until a whirl of exaltation is reached. A feature of the *Fandango* and also of the *Seguidilla* is a sudden pause of the music towards the end of each measure, upon which the dancers stand rigid in the attitudes in which the stopping of the music found them, and only move again when the music is resumed. M. Vuillier, in his *History of Dancing*, gives the following description of the *Fandango*:—"Like an electric shock, the notes of the *Fandango* animate all hearts. Men and women, young and old, acknowledge the power of this air over the ears and soul of every Spaniard. The young men spring to their places, rattling castanets or imitating their sound by snapping their fingers. The girls are remarkable for the willowy languor and lightness of their movements, the voluptuousness of their attitudes—beating the exactest time with tapping heels. Partners tease and entreat and pursue each other by turns. Suddenly the music stops, and each dancer shows his skill by remaining absolutely motionless, bounding again into the full life of the *Fandango* as the orchestra strikes up. The sound of the guitar, the violin, the rapid tic-tac of heels (*tacomeos*), the crack of fingers and castanets, the supple swaying of the dancers, fill the spectator with ecstasy. The measure whirls along in a rapid triple time. Spangles glitter, the sharp clank of ivory and ebony castanets beats out the cadence of strange, throbbing, deepening notes—assonances unknown to music, but curiously characteristic, effective and intoxicating. Amidst the rustle of silks, smiles gleam over white teeth, dark eyes sparkle and droop and flash up again in flame. All is flutter and glitter, grace and animation—quivering, sonorous, passionate, seductive."

The *Bolero* is a comparatively modern dance, having been invented by Sebastian Cerezo, a celebrated dancer of the time of King Charles III. It is remarkable for the free use made in it of the arms, and is said to be derived from the ancient *Zarabanda*, a violent and licentious dance, which has entirely disappeared,

and with which the later Saraband has practically nothing in common. The step of the *Bolero* is slow and gliding but well marked. It is danced by one or more couples. The *Seguidilla* is hardly less ancient than the *Fandango*, which it resembles. Every province in Spain has its own *Seguidilla*, and the dance is accompanied by *coplas*, or verses, which are sung either to traditional melodies or to the tunes of local composers, indeed, the national music of Spain consists largely of these coplas.

The *Jota* is the national dance of Aragon, a lively and splendid, but withal dignified and reticent, dance derived from the 16th century *Pasacalle*. It is still used as a religious dance. The *Cachucha* is a light and graceful dance in triple time. It is performed by a single dancer of either sex. The head and shoulders play an important part in the movements of this dance. Other provincial dances now in existence are the *Jaleo de Jerez*, a whirling measure performed by gipsies, the *Paloté*, the *Polo*, the *Gallegada*, the *Muyneria*, the *Habas Verdes*, the *Zapateado*, the *Zorongo*, the *Vito*, the *Tramo* and the *Tripola Trapala*. Most of these dances are named either after the places where they are danced or after the composers who have invented tunes for them. Many of them are but slight variations from the *Fandango* and *Seguidilla*.

Great Britain.—The history of court dancing in Great Britain is practically the same as that of France, and need not occupy much of our attention here. But there are strictly national dances still in existence which are quite peculiar to the country, and may be traced back to the dances and games of the Saxon gleemen. The *Egg dance* and the *Carole* were both Saxon dances, the *Carole* being a Yule-tide festivity, of which the present day Christmas carol is a remnant.

The oldest dances which remain unchanged in England are the *Morris dances*, which were introduced in the time of Edward III. (See MORRIS DANCE.)

Dancing practically disappeared during the Puritan regime, but with the Restoration it again became popular. It underwent no considerable developments, however, until the reign of Queen Anne, when the glories of Bath were revived in the beginning of the 18th century, and Beau Nash drew up his famous codes of rules for the regulation of dress and manners, and founded the balls in which the polite French dances completely eclipsed the simpler English ones.

The only true national dances of Scotland are reels, strathspeys and flings, while in Ireland there is but one dance—the jig, which is there, however, found in many varieties and expressive of many shades of emotion, from the maddest gaiety to the wildest lament. Curiously enough, although the Welsh dance often, they have no strictly national dances.

Popular Dances of Universal Importance.—The *Waltz* is no doubt the most popular of the 19th century dances. Its origin is a much-debated subject, the French, Italians and Bavarians each claiming for their respective countries the honour of having given birth to it. As a matter of fact, the waltz, as it is now danced, comes from Germany, but it is equally true that its real origin is French, since it is a development of the *Volte*, which in its turn came from the *Lavolta* of Provence, one of the most ancient of French dances. The *Lavolta* was fashionable in the 16th century and was the delight of the Valois court. The *Volte* danced by Henry III. was really a *Valse à deux pas*, and Castil-Blaze says that "the waltz which we took again from the Germans in 1795 had been a French dance for four hundred years." The change, it is true, came upon it during its visit to Germany, hence the theory of its German origin. The first German waltz tune is dated 1770—"Achl du lieber Augustin." It was first danced at the Paris opera in 1793, in Gardel's ballet *La Danse-mante*. It was introduced to English ballrooms in 1812, when it roused a storm of ridicule and opposition, but it became popular when danced at Almack's by the emperor Alexander in 1816. The waltz *à trois temps* has a sliding step in which the movements of the knees play an important part. The tempo is moderate, so as to allow three distinct movements on the three beats of each bar, and the waltz is written in 3-4 time and in eight-bar sentences. Walking up and down the room and occasionally breaking into the

step of the dance is not true waltzing, and the habit of pushing one's partner backwards along the room is an entirely English one. But the dancer must be able to waltz equally well in all directions, pivoting and crossing the feet when necessary in the reverse turn. It need hardly be said that the feet should never leave the floor in the true waltz. Gungl, Waldteufel and the Strauss family may be said to have moulded the modern waltz to its present form by their rhythmic and agreeable compositions. There are variations which include hopping and lurching steps, these are degradations, and foreign to the spirit of the true waltz.

The *Quadrille* is of some antiquity, and a dance of this kind was first brought to England from Normandy by William the Conqueror, and was common all over Europe in the 16th and 17th centuries. The term quadrille means a kind of card game, and the dance is supposed to be in some way connected with the game. A species of quadrille appeared in a French ballet in 1745, and since that time the dance has gone by that name. It then consisted of very elaborate steps, which in England have been simplified until the degenerate practice has become common of walking through the dance. The quadrille, properly danced, has many of the graces of the minuet. It is often stated that the square dance is of modern French origin. This is incorrect, and probably arises from a mistaken identification of the terms quadrille and square dance. "Dull Sir John" and "Tune I would," were square dances popular in England 300 years ago.

An account of the country dance, with the names of some of the old dance tunes, has been given above. The word is not, as has been supposed, an adaptation of the French *contre danse*, neither is the dance itself French in origin. According to the *New English Dictionary*, *contre danse* is a corruption of "country dance," possibly due to a peculiar feature of many of such dances, like Sir Roger de Coverley, where the partners are drawn up in lines opposite to each other. The English "country dances" were introduced into France in the early part of the 18th century and became popular, later French modifications were brought back to England under the French form of the name, and this, no doubt, caused the long-accepted but confused derivation.

The *Lancers* were invented by Laborde in Paris in 1836. They were brought over to England in 1850, and were made fashionable by Madame Sacré at her classes in Hanover Square Rooms.

The *Polka*, the chief of the Bohemian national dances, was adopted by society in 1835 at Prague. Josef Neruda had seen a peasant girl dancing and singing the polka, and had noted down the tune and the steps. From Prague it readily spread to Vienna, and was introduced to Paris by Cellarius, a dancing-master, who gave it at the Odéon in 1840. It took the public by storm, and spread like an infection through England and America. Everything was named after the polka, from public houses to articles of dress. Mr. Punch exerted his wit on the subject weekly, and even *The Times* complained that its French correspondence was interrupted, since the polka had taken the place of politics in Paris. The true polka has three slightly jumping steps, danced on the first three beats of a four quaver bar, the last beat of which is employed as a rest while the toe of the unemployed foot is drawn up against the heel of the other.

The *Galop* is strictly speaking a Hungarian dance, which became popular in Paris in 1830. But some kind of a dance corresponding to the galop was always indulged in after *Voltes* and *Contre-dances*, as a relief from their constrained measures.

The *Barn dance* is no doubt of American origin, its height of popularity being toward the end of the 19th century. It was customary for the farmer who wished to build a new barn to call in his neighbours for a "working" and finish the job within a short time, after which a dance was "thrown." The dance is still very popular in certain rural sections, and does not necessarily confine itself to new or empty barns. The square dance, or some form of group dancing, is executed to the accompaniment of a two- or three-piece string band or the neighbouring fiddle.

The *Paul Jones* is one of the many "sets" that evening of barn-dancing. A number of couples are at the performance as well as a "caller" who gives direct action of each couple.

The *Washington Post* belongs to America.

The *Polka Mazurka* is extremely popular in Vienna and Budapest, and is a favourite theme with Hungarian composers. The six movements of this dance occupy two bars of 3/4 time, and consist of a mazurka step joined to the polka. It is of Polish origin.

The *Polonaise* and *Mazurka* are both Polish dances and are still fashionable in Russia and Poland. Every State ball in Russia is opened with the ceremonious Polonaise.

The *Schottische*, a kind of modified polka, was "created" by Maikowski, who was the proprietor of a famous dancing academy in 1850. The *Highland Schottische* is a fling. The Fling and Reel are Celtic dances, and form the national dances of Scotland and Denmark. They are complicated measures of a studied and classical order, in which free use is made of the arms and of cries and stampings. The *Sirathspey* is a slow and grandiose modification of the Reel.

Mr Roger de Coverley is the only one of the old English social dances which has survived to the present day, and it is frequently danced at the conclusion of the less formal sort of balls. It is a merry and lively game in which all the company take part, men and women facing each other in two long rows. The dancers are constantly changing places in such a way that if the dance is carried to its conclusion everyone will have danced with everyone else. The music was first printed in 1685, and is sometimes written in 2-4 time, sometimes in 6-8 time, and sometimes in 3-9 time.

The *Cotillon* is a modern development of the French dance of the same name referred to above. It is an extremely elaborate dance, in which a great many toys and accessories are employed, hundreds of figures may be contrived for it, in which presents, toys, lighted tapers, biscuits, air balloons and hurdles are used.

Ballet—The modern ballet (*q.v.*) would seem to have been first produced on a considerable scale in 1489 at Tortona, before Duke Galeazzo of Milan. It soon became a common amusement on great occasions at the European courts. The ordinary length was five acts, each containing several *entrées*, and each *entrée* containing several quadrilles.

BIBLIOGRAPHY—For the old division of the *Arts Gymnastica* into *palaestra* and *saltatoria*, and of the latter into *cubistica*, *sphaeristica* and *archistica*, see the learned work of Hieronymus Mercatorius, *De arte Gymnastica* (Amsterdam, 1572). Cubistic was the art of throwing, somersaults, and is described minutely by Tuccaro in his *Trois Dialogues* (Paris, 1599). Sphaeristic included several complex games at ball and tilting—the Greek *skipetokos* and the Roman *trigonalis* and *paganica*. Orchestic, divided by Plutarch into *latus*, *figura* and *modicatio*, was really imitative dancing, the "silent poetry" of Simonides. The importance of the *xenodochia* or hand-movement is indicated by Ovid—"Si vox est, cantu, si mollia brachia, salta." For further information as to modern dancing, see Rameau's *Le maître à danser* (1726), Querlet's *Le triomphe des grâces* (1774), Cahouse, *La danse ancienne et moderne* (1754), Vuillier, *History of Dance*, (Eng. trans., 1897), Giraudet, *Traité de la danse* (1900).

JAPAN

The dance in Japan has its origin in her mythical age. According to the 8th century *Kofu*, when Amaterasu, the sun-goddess, retired in high dudgeon to a cavern, Ama no Uzumeno mikoto danced at the cavern's mouth to lure her out. *Kagura*, the sacred dance of today, is traced back to this incident by the native literati. Records speak of the emperor Inkō playing on a *wa gon* (Japanese native *hoto*) and the empress dancing at the imperial banquet given in 419 on the completion of their new palace building. In the Orient the dance is as old as history, and when some 7,000 Chinese families emigrated to Japan in 540 it is not to be doubted that they brought with them their cherished national custom. In 552 a Korean monarch sent a Buddhist mission to Japan and the dance formed a part of their religious ceremony. The old picturesque dance of China and Korea is still executed semi-annually, to the sound of flutes and waving of feathers in worship by the followers of Confucius. The dance became definitely established as a Japanese institution by the Ashikaga Shōgun (1367-1395). Yoshimitsu's school for dancing, and the Shōgun incorporated many historical themes of China into dramatic dances. With the invention of the *Nō* play by Kwanami otōsugu (1406) and its development by his equally famous son, Ōta Motokifu, the dance became closely associated with the

national theatre. In the 16th century the fame of the beautiful Okuni popularized the dance among all classes of society. But the tradition begun by her was interrupted in 1613 when for reasons of public morality, women were forbidden to appear upon the stage, male actors and the priests of buddhism continued the ancient custom of Korea and China. Western billroom dances such as waltzes and two steps were introduced to Japan in the last quarter of the 19th century and became a fashion for a time, but were soon dropped, and then revived again. (A K)

Visitors to Japan generally return deeply impressed with the beauty of cherry blossoms and the charming grace of the *geisha* girl dance. The dance is performed not only by the *geisha* and other dancing professionals, but is given in connection with the classical *Nō* drama, and it plays an important part in the old style of acting known as *kabuki* for, as an eminent actor of the old school has said, "an actor without ability to dance is like a wrestler without strength." Sacred dances called *kagura*, very simple in character, are given by maidens at some shrines, while Buddhist dances, such as *Nembutsu odori*, may be seen in connection with some religious observances.

Speaking of the native dance of Japan, three terms are used *mai*, *odori* and *furi* or *shosa*, all meaning dance, though technically differentiated. The first has been used to designate the older style of dancing which has been in vogue among the upper class and come to be performed by professionals. It is likened to the graceful movements of the crane at sunrise. The second, which does not appear in literature before the 15th century, has been applied to the dance that was born and has become a fashion among the common people. It means the spontaneous expression of joy with gesture of hands and feet common to all people. The third designates the dance woven into the acting on the stage. *Mai* may be said to designate a classical, *odori* a popular and *furi* a dramatic dance. However, the first may also be classified into two classical and popular. The classical *mai* is preserved in the imperial court in connection with traditional observances or in Shinto shrines as *kagura*, or in *Nō* drama, while the popular *mai* is practically the same as *odori* but called *mai* according to the custom peculiar to certain localities. It is generally maintained that in *mai* the attitude is characterized by solemnity, the gesture by elegance and refinement, and the movement by an easy and natural flow, while in *odori* the dance is more natural and free in attitude and movement, and the gesture more active and subtle, with a greater freedom for variation, allowing even a comical or a rustic element to creep in. *Furi* is enlivened with dramatic quality. However, in many instances the distinction is hard, or even impossible, to draw. Moreover, the three terms may be said to represent different essential elements in the dance, rather than its kinds.

The dance of Japan may generally be divided into two classes the popular and the special or professional. The former is for the pleasure of the mass of people who may acquire the art in several days or weeks, and it includes such dances as *Ise odori* (time-honoured dance in the province of Ise), *Tanabata odori* (for the festival of the star Vega) and others connected with popular festivals, as well as such religious dances as *Bon-odori* (held in summer in memory of the dead), *Nembutsu odori* (with Buddhist prayers), etc. The professional dances are acquired only by patient and laborious practice, requiring at least several years to master them. Some of these dances consist purely of graceful movements, while others are enlivened with dramatic elements. Those with dramatic elements try to narrate a story in rhythmic movements or to reveal feelings of joy, anger, sorrow, love, hatred, etc., either expressed or suggested in the songs or music played in accompaniment. The songs so used are of different styles, such as *naga uta*, *tokuwazu* and *kyōmoto*, all rendered to the accompaniment of *samisen*, the three stringed musical instrument, and some with drums and flutes in addition. The songs are descriptive of scenery, narrative of historical or traditional events, accounts of heroes, of love or madness, sometimes they deal with ghosts of men and women, or with the spirit of a bon or of a spider, etc., an effort being often made to transport the observer to the realm of dreams.

The dramatic dance was originally taught by actors themselves until about the beginning of the 18th century, when it became an independent profession. The pioneers of that profession in Tokyo were Dajiro Shigayama, who was originally an actor, Kwambé Fujima and Senzo Nishikawa, the founder of his own school or style, followed by other masters who formulated styles of their own, each with a number of followers. The most influential styles of dancing in Tokyo are *Fujima ryu*, *Henayagi ryu*, and *Wakayagi ryu* (ryu meaning style or school). Those of Kyoto are *Inouye ryu* and *Shimozaki ryu*, those of Osaka are *Nishikawa ryu*, *Yamamura ryu* and *Uemoto ryu*, while Nagoya is dominated by *Nishikawa ryu*. Broadly speaking, the dances in vogue in Tokyo are those with a dramatic element, being bold and active, cheerful and witty in style, more fitting to be performed by men on the stage than in a room, while those of Nagoya, Kyoto and Osaka, which lay great stress upon the grace and charm of movement, are more appropriate to be seen in a room than on the stage, and performed by female rather than male dancers.

According to a rule, the dancer begins at a point one step behind the centre of the stage, and brings the dance to a close at the centre with a stamp of the foot. The first step is to be taken with an "active" effect and the last with a "passive" feeling. Generally the dancer, in the course of the performance, describes a shape of a folding fan, which symbolizes prosperity as it spreads out toward the end. In pose, the face or the head of the dancer is considered to stand for heaven, the shoulders for the earth, and the waist for the man, indicating the three most important points to be considered in the dancing, and suggesting the relation of the one towards the others in the order of the universe. However, all parts of the body are used to make the dance well balanced, graceful and effective. While limbs, chiefly arms and hands in an endless variety of graceful sweeps and powerful flourishes, are mainly relied upon for the rhythmic movement, the waist keeps the equilibrium. A fan or a *tengu* (scarf) is often used in dancing, being manipulated to suggest all sorts of things as the occasion may require. To give a few examples in common practice, an open fan raised gradually in front signifies the rising sun, used in a drinking attitude it may represent a wine cup, a closed fan may be used to suggest a stick, a bow, an arrow, or a gun, etc., a scarf may be doubled and thrust into the sash to indicate long and short swords worn by a samurai, when redoubled and held on the palm in a smoking attitude it may serve as a pipe, or it may be made to describe running water by holding one end of it and giving it a quick succession of jerks from one side to the other.

It has been the ideal of some great master dancers of Japan to give the dance dignity, refinement and charm by investing it with idealistic, rather than realistic, quality, to make it suggestive, rather than merely explanatory, to create an interesting design, rather than a conglomeration of decorations. The dance of Japan is unique in many respects, and rich in beauty and tradition as the cherry blossoms that adorn the country in spring. INDIA

The Dramatic Dance—Dancing and the drama in India are inseparable. The same words *nata*, *nati*, actor, actress, also designate dancer, danseuse, and a theatre (*nāṭya-sala*, *veśma*) is equally a dancing stage. The classic Indian theatre is a thing of the past, with perhaps some exceptions in the south, but its technique survives in the modern "nautch" (*nāṭ*). Dancing is of three sorts, according to the content, and two according to style. *Nāṭya* is dancing used in a drama (*nāṭaka*) as part of the plot (the word *nāṭayati*, "gesturing," or "acting as if," is a regular stage direction whenever a particular action or mood is to be portrayed), *nṛtya* is dancing that expounds a theme by means of explicit gestures, *nṛtta* is dancing to music, but without a definite theme, and includes folk (*deśi*) dancing. The first two are of the same character. Beyond this, *tāṇḍava* is a masculine and vigorous style of dancing, *lasya* a feminine and graceful style.

The dance in its higher forms (*nṛtya*), as distinguished from merely decorative, and from the folk dance is a sort of pantomime in which a story is told, or events or persons alluded to, by means of formal gestures (*angulābhīnaya*) presented in a rhythmic sequence and accompanied by singing and instrumental music, it is a kind of visible poetry with a definite meaning. Treatises on dancing are essentially dictionaries of gesture defining certain positions and movements of the head, neck, eyes and, above all, the hands, the latter are particularly used to convey explicit meanings, the head and eyes to express emotions. A single "hand," for example, the "flag" (*pataka*) hand, in which the fingers are extended in contact as when giving a slap, may have twenty or more meanings, depending on the way in which it is moved or the position in which it is held, and on the context of preceding and following "hands." In this kind of dancing the movement of the lower limbs is restricted to a quite subordinate rhythmic accompaniment, the dancer may indeed be seated.

The dance is accompanied by singing (by the dancer or by a chorus) and by instruments (usually in the north a *sārang* and drums, in the south a *tambura* and drums). The whole course of the dance may be summarized as follows: "The song should be sustained in the throat, its meaning must be shown by the hands, the mood must be shown by the glances, rhythm is marked by the feet. For wherever the hand moves, there the glances follow, where the glances go, the mind follows, where the mind goes, the mood follows, where the mood goes, there is the flavour" (Coomaraswamy and Duggarī, *Mirror of Gesture*).

Dance Songs—The songs of *bayaderes* are the lauds and songs of devotion of classical poets, the theme of their dances, the deeds of Kṛṣṇa, and the interplay of hero and heroine with their esoteric meaning. All conditions in India are penetrated and illuminated by a devotional culture. Three examples of songs, sung by the dancer while dancing and forming the theme of the dance, may be quoted (the first from northern India (*Mathura*), the second from the south (*Tanjore*), the third with an antiquity of a millennium and a half).

THE LONELY WIFE

Left all alone, my darling gone to another land, how
can I pass the days and nights?
Left all alone, winning both her hands, left all alone
The rainy season has begun, the lightning flashes, the
night is dark, left all alone
Senseless is my darling, my bed lies empty, left all
alone!

It should be explained that it is usual to abandon warlike operations during the rainy season, hence, if a man has not at that time returned, the suffering of the woman left at home is intensified by every reminder of the time when he should have been expected. In the actual dance, which is one of those that can suitably be performed seated, not only is the emotional experience clearly expressed, but the rain, the lightning and the dark night can all be represented.

The words of a Tanjore song are descriptive of Viṣṇu

Is he the great being who rides on Garuda?
Is he the great being who sleeps on a snake?
Is he the great being who lifted Mt. Govardhana
upon his little finger?
Is he the great being who assumed the form of
the Fish Avatār?

The avatārs of Viṣṇu are then given successively.

The words of Mālika's dance in Kālidāsa's classical Sanskrit play, the *Mālavikāgnimitra* (Act II) are as follow

My beloved is hard to obtain, be thou without hope with respect to him, O my heart!

But lo, I feel a throbbing in the outer corner of my left eye!
How then is this man, seen only after a long time, to be won?
My Lord, reflect that I am devoted to thee with ardent longing!

The stage direction, *Iti yathāśaṃ abhayaṇyati*, "She gestures in accordance with the flavour (or sentiment)." "She

Like Indian music, the dance form begins and ends, from a Western point of view, unexpectedly there is no emotional climax, no excitement. Above all, it is not an exposition of the drama.

!A good omen

personality. Aesthetic experience, from the Indian point of view, is the work of the spectator, all that the artist can do is to provide the conditions. The dance is in no way strange or exotic to the Indian audience, its continuous rhythm, which can be more nearly paralleled in Western art by the music of Bach than by that of Beethoven, lends the spectator not away from himself, but far into himself. It is just because the visible spectacle is not insistent, not something to be curiously observed, but something that penetrates beyond the threshold of consciousness to the inner world of each beholder, that it can be watched for many hours without fatigue. Circumstantially, of course, the dance is more varied than at first it seems to be, for example, not only do the themes of successive dances change, but with every hour of the night the modes of the accompanying music must change, in accordance with a well understood convention. It is not this variation, however, that explains the lack of monotony, that is due to a quality inherent in the art itself, whereby the spectator loses consciousness of the passage of time. It will be understood that this is not an art which can be transported to a foreign land, and perhaps the only opportunity that Europeans in Europe have ever had to witness oriental dancing was when King Sisowath brought his Cambodian dancers to Marseille and Paris.

Aesthetic Experience—Mention has been made above of flavour in Indian aesthetics. Flavour (*rasa*) is that emotional quality which distinguishes a work of art from a mere statement, and aesthetic emotion from the emotions experienced in daily life. To the Indian, the dance, like any other art, has a spiritual significance independent of its theme or charm, for "by clearly expressing the flavour, and enabling men to taste thereof, it gives them the wisdom of Brahma, whereby they may understand how every business is unstable, from which indifference to such business, and therefore, arise the highest virtues of peace and patience, and thence again may be won the bliss of Brahma."

The so-called oriental dancing of the European stage is in almost all respects unlike the dancing of the East where, for example, the dancer is always more, and not less, fully clothed than are other women in daily life, and where, if there be in the dance some erotic allusion, this not only has a definite significance, but is made in such a way as entirely to escape the notice of a western audience. The movements of the so-called oriental dancers of the West are indeed smug, but the fluidity of eastern movement is something far more than this. It is not even serpentine, but more like the wreathing of smoke. Nothing in India corresponds to the ball room dancing of Europe and America, the mixed dancing of this kind is shocking to Indian ideas of propriety.

Education—Dancers (female) are to a certain extent trained (Plate III, figs 3, 4) by performers of their own caste and sex, but more especially by male dancing masters, Brahmans, who are familiar with the literature as well as the practice of the art. Ganadassa speaks of the art as "a pleasing sacrificial feast to the eyes of the gods and the one chief amusement of human beings." He exhibits his pupil Mālavikā before the king, queen and certain courtiers. Her performance is adjudged perfect in the following terms: "All was blameless, and in accordance with the rules of art, for the meaning was completely expressed by her [upper] limbs, which were full of language, while the movement of her feet was in perfect time, and she represented the moods to perfection. In the successive developments of the acting, emotion kept banishing emotion from its place, it was a vivid picture of a series of passions" (*Mālavikāgnimitra*, Act. II).

An account of the education of a dancer is found in the Tamil *Silappadikāram*, ch. 11. She is initiated in her fifth year by means of the *tandiyampadipattin* ceremony. Here a horizontal rod, wound about with flowers and a new cloth, is held by two dancers. The new pupil, bringing offerings of coconut, betel leaves, etc., and standing on grains of rice, symbolizing plenty, touches the rod with folded hands, repeating verses chanted by the instructor in honour of Ganapati and Jayanta. At the same time the instructor holds the pupil's feet and moves them according to the steps of the dances, and anklets with bells are placed on the ankles. This is a life dedication to the calling of a dancer. Instruction is

begun in her seventh year, and must last at least five years. The theoretical part is usually given by a Brahmin teacher, the practical exercises by an elderly and retired danseuse. In her twelfth year the pupil may appear in public and the teacher receives a reward.

Domingo Páez, writing about 1520, describes a room in the Vijayanagar palace in which the royal dancers practised and performances were given. On one side was "a painted recess where the women cling on with their hands in order better to stretch and loosen their bodies and legs." Presumably there was a horizontal rod against the wall, like that used by modern ballet dancers for practice. At the other end of the room was the place occupied by the king during a performance, and in the middle of the wall was a golden image of a woman, or rather girl of 12 years, with her arms in the position taken at the end of a dance.

Generally speaking, the costume of a dancer does not differ markedly from that of local fashion, except by its greater richness. One part of it, the bells, however, is special and essential. A string of these, a hundred or two hundred in number, is bound round the ankles at the time of dancing, and the sound of these bells, as the dancer moves her feet in time, forms part of the music. When the dancer ties them on before dancing, she will invariably touch them to her eyes and forehead and murmur a brief prayer, and those who are learned in the lore of dancing say that "that dancing is vulgar and inauspicious which the actress does not begin with prayer."

Like other vocations in India, that of music, dancing and acting is in the main an hereditary profession. There have always been and still are some Brahmans and others of high caste who are expert both in the theory and practice of music, but the profession as practised by members of special castes has always had a low social status. At the present day the "Anti Nautch movement" represents an endeavour to boycott the professional dancers on puritanical grounds (with reference to the morals of the dancers, not to the character of the dance). It is desired to banish the danseuse alike from private and public entertainments and from all connection with temple service.

HISTORY OF THE DANCE IN INDIA

Vedic Dances—Ritualistic dances are mentioned in the Vedas. Thus, in the Mahāvratā ceremony, women celebrate to the sound of the lute the patrons of the ceremony, maidens dance round the fire with water pitchers while the Sotras are being performed. They pour water on the fire, an act of sympathetic magic intended to produce rain, and the song shows that they desire richness in milk, as well as water for the cows. At the close of the Horse Sacrifice also girls dance round the Marjāliya fire with water-pots on their heads, beating the ground with their feet and singing "This is honey." They are said to endow the sacrificers with might. Again, four or eight women dance at the house of the bride, at a wedding.

The word *śāstā* in the *Black Yajur Veda* refers to the accompaniment of recitation by pantomimic gesture. The *Nāṭya Śāstra* mentioned by Pāṇini must have been handbooks of gesture, analogous to the later works on *abhinaya*.

Dancing as a Court Function—In the Buddhist and Epic periods, dancing is well known as a normal court function and as a means of paying honour to a king or distinguished guest. Thus the festival of the gods takes place in Indra's city, he is host, and the other gods come and take their seats in due order as spectators of the dance of the Gandharvas and Apsaras. The gods themselves may sing and dance in honour of a human saint, but the dancers and musicians proper are the Gandharvas and Apsaras. The latter are beautiful girls, often employed by the gods to seduce the great saints from their meditations, for which there is a parallel in the Buddha legend in the attempted seduction of Gautama by the three daughters of Māra, who dance before him. More often the Apsaras are simply the dancers in heaven, by whom the gods are entertained and honoured. Equally characteristic was the keeping of troupes of dancers at royal courts on earth. Whatever the social status of professional dancers may always have been, and despite the fact that the art, like others, is an

almost purely professional vocation, it is certain that dancing in the Gupta and mediaeval periods was also an aristocratic accomplishment, affording in this respect a parallel to the state of painting at the same time

Dancing as an Accomplishment—Dancing and music as a royal accomplishment may be illustrated by the following examples. In the *Dvayavadana* (Cowell and Neill, p. 544 *et seq.*) King Rudrāyana plays the lute (*vr̥ṇā*) while his wife Candrāvṛti dances, the Gupta emperor, Samudragupta, had cons struck in which he is represented as seated and playing on the lyre or lute, while an inscription of the same great monarch at Allihābad records his skill in music. Kālidāsa represents King Agnivanman as competing with actors in their art. In Devendrī's *Uttarādhyāyana tīkā* (Meyer, *Hindu Tales*, p. 105) King Udiāyana plays on the lute while his wife dances, but drops the plectrum of the lute, at which the queen is angered and asks "Why have you spoilt the dance?" In the *Mahāvamsa*, ch. lvi, v. 82, 83, Parākrama Bāhu I (of Ceylon) is said to have built a theatre beside his palace "that so he might listen to the singers, and witness the delightful dance," while his queen Rūpavati, who was young and beautiful, and an embodiment of all the traditional virtues of a Hindu wife "was skilled in dancing and was richly endowed with a mind as keen as the point of a blade of grass." These instances will suffice to show that the modern prejudice against dancing as an art to be studied by persons of honourable social status has no foundation in classic tradition.

Dancing as a Religious Office—Still more interesting is the ritual service of dancing in temples. The proper occasions of dancing are festivals, celebrations, processions of men or gods, marriages, reunion of friends, first occupation of towns or houses, the birth of children and similar auspicious events. The dance is essentially an honour paid to the chief guest, and particularly to kings. Now the ritual or service performed at the shrine of a deity is essentially the same as the daily service of a king, and it is therefore only natural that dancing before the shrine should form a part of the regular morning and evening offices. At wealthy shrines a considerable number of Devadāsīs ("women servants of the deity") are permanently attached to the temple, both to perform this office and to take part in the dramas which are presented in the temple on certain holidays. This practice has survived in southern India to the present day, but we have earlier records of it on a more lavish scale (N. M. Penzer, *The Ocean of Story*). Inscriptions of Rājārāja and other of the Cola kings (in the Tanjore district, at the beginning of the 11th century) refer to theatres and the establishment of large numbers of dancers in connection with temples, and for this purpose we find that private as well as royal endowments were made. Thus the assembly or town council of Sāttanūr gave lands for the maintenance of Sanskrit plays, Rājārāja brought from other temples and settled at Tanjore as many as 400 dancing girls, Kulōttunga III appointed an additional dancing master in the temple who had to dance with gestures. The entertainment of the god enshrined is modelled upon that of a god in his heaven, and that of a king on earth.

DANCES OF THE GODS

The Veda knows of gods who dance, thus, in *Rigveda* x, 72, we have a creation hymn in which the gods, dancing apparently in a ring, set up a rhythmic flux in the primeval waters, and this magic dance sets all nature in motion.

When there, O gods, ye stood in the primeval sea, holding each the other by the hand, then rose from you as dancers (*nṛjyātmā vva*) clouds of dust.

Indra is also said to appear as an aged dancer, as a presage of victory in battle, Usas, the Dawn, is called a dancer adorning herself. But none of these conceptions of a dancing god or gods seems to have had the importance later attained in the case of Śiva, who as the divine dancer *par excellence* is known as Natarāja.

Dance of Śiva—We find an invocation (commencement of the *Mirror of Gesture*) addressed to Śiva, the great patron of the drama and an actor whose gesture is the world process whose

speech is the sum of all languages and whose ornaments are the moon and stars. His dances are *tāṇḍava* dances, enigmatic and virile. The most significant is the *nāṭya*, represented in the well known south Indian metal images of Natarāja. The significance of this dance is often alluded to in the mediaeval Śaiva literature. "Our Lord is the dancer, who, like the best latent in firewood, diffuses his power in mind and matter, and makes them dance in their turn." More specifically, the dance represents the deity's five activities (*pañcākṛtya*), viz., the world process of creation or evolution, maintenance, and destruction or involution, the embodiment of souls and their release from the cycle. The drum in the upper right hand stands for creative sound, the flame in the upper left for the fire of destruction or change. It should be understood that in Indian mythology the cosmic process is conceived as a succession of vast cycles of manifestation and nonmanifestation, or creation and destruction, and also that the phenomenal world at all times is one of perpetual change, involving perpetual creation and destruction. The dance is the entire process in all its complexity, and it is only rightly apprehended when it is realized as taking place within the worshipping's own consciousness. Śiva is also called Sudānyāyī, Dancer of the Burning Ground (cemetery), and the heart of the lover of god, made bare of all else, is this bare field prepared for him. The same idea is met with in connection with the goddess in the form of Kālī.

I have made a burning ground of my heart,
Thou, Dark One, haunter of the burning ground
Mayest dance the eternal dance therein.

Śiva also performs an evening dance on Mt. Kailāsa, before the assembled gods and the goddess, and paintings of the subject are known. The elephant headed deity, Gaṇeśa (Ganesha, Ganapati), son of Śiva, is also spoken of as taking part in this evening dance, and is represented in sculpture as dancing. It is probable that most of the dances referred to above belong to the non-Aryan and ancient Dravidian elements in the personality of Śiva-Rudra. The *tāṇḍava* in particular, and the dance of Kālī, must have been originally orgiastic dances, later interpreted in a phallosophical and mystical sense. The principal "primitive deity" in Ceylon, Gale Yākā, the God of the Rock, is worshipped by an annual dance on the summit of the rocks sacred to him, with which may be compared the ritual dances of south Indian hill-men in honour of Murugan.

While every Śaiva temple in southern India has a copy of the metal image of Śiva as Natarāja kept in a special hall of audience (*sabhā mandapa*) at Cidambaram, he is worshipped in this form as the principal deity, there in the Golden Hall (*kanakasabha*) is the premier Natarāja image of the south. The western and eastern gopurams of this temple, dating from the 13th century, contain sculptured panels with accompanying text, illustrating no less than 93 of the 108 dancing poses described in the *Bharatya Nāṭya śāstra*.

Dances of Other Deities—The elephant headed deity, Gaṇeśa, son of Śiva, is a patron of the stage, and himself often dances. In Buddhist art numerous feminine divinities, corresponding in a general way to Kālī of the Hindu pantheon, are represented as dancing. Dances of victory are attributed in the Śilappadigāma to Subrahmanya, the god of war. According to the commentator, Adyākūṇalār, Subrahmanya, having slain the demon Sūrapadmāsura, danced his war dance of triumph on the heaving wave platform of the ocean stage, to the accompaniment of the rattle of his drum, and subsequently danced in derision of the flying demons the *kudakūṭṭu*, or umbrella dance. This dance is still sometimes performed during temple processions, when the god's umbrella bearer cuts some capers with his unwieldy parasol borne before the deity. Other familiar dances of a deity are those of Kṛṣṇa, the cowherd incarnation of Viṣṇu. One of these is the pot-dance (*kudakūṭṭu*), originally a pastoral folk dance, but used by Kṛṣṇa as a dance of victory after the defeat of Bāṇāsura. Another dance of victory took place after the poisonous dragon Kālyāṇa finally had been overcome. Kṛṣṇa is again often represented dancing a childish dance with a vat of butter, or he was very fond. But the most significant of his dances

rosa mandala, the circle of pison, a round dance in which the milkmaids took part on moonlit nights beside the Jamma

FOLK DANCES

Folk dances (*desi*, i.e., "countrified") still are and no doubt have always been found all over India, among agriculturists and in primitive tribes everything is celebrated and solemnized with the dance. It should be observed that, as Col Hodson has remarked, primitive culture is the matrix of the higher, thus the folk dances have not only an interest of their own, but also they provide the material from which the dances of the aristocracy and of the higher ritual are derived. Indeed, there are many folk dances which make their appearance in the most artistically sophisticated spheres as *dances of divertissement*. Before referring to these, however, we shall discuss the dances of the people in their original environment.

There are, for example, courtship dances among the Santals. On full moon nights the drum is sounded and the girls assemble under a big banyan tree, their dresses decorated with flowers in spring, with feathers in winter. Meanwhile the young men with a banner and musical instruments gather in the rice fields beyond. The girls do not seem to see them, but are chattering together and completing their toilet. Then the banner and drum come forward, the young men approach the girls, who stand in a row, linked in pairs, arm in arm. The girls sway to and fro with the music, bending and rising, they advance and retire, but never actually mix with the young men. It is only after the dancing that young men and women have any opportunity to meet and court. The Santals have also their decorative *dances of divertissement*, for example, "the gathering of indigo," and "the quarrelling of co-wives."

In Bengal there is a women's ritual dance, never seen by men, the drummer remaining behind a curtain. This takes place during the Indra-puja festival on full moon nights. The women dance a song erotic songs and in the morning they go down to the river and bathe.

A kind of dancing especially characteristic of southern India and Ceylon is the so-called civil dance (*Yakkum natuma*). This is a violent male dance, thus of *tandava* character. Used primarily as a means of exorcism, it is performed in cases of sickness. The possessing yaklas, regarded as demons causing disease, are first invited by beat of drum to attend the performance, afterwards, having been thus entertained, they are asked to take their departure.

The Nongrem dance, one of the greatest festivals in the Khasi hills, is an essential part of the goat sacrifice performed by the Siem of Nongrem. "The sacrifice is followed by twenty two men armed with swords and cowries (fly flaps). Having danced before the altar, the party returns to the house of the Siem priestess and executes another dance in the great courtyard. Then follows a great dance of girls and men in front of her house. Then there is the dance of the men. After gyrating for some time two men at a time rapidly approach one another and clash their swords together in mock combat. Dancing forms part of the ceremony of placing the ashes in the *sapichre* of the clan." With the last feature may be compared the honouring of the body of the Buddha before the cremation, with song, dance and music, as mentioned in the *Mahāparinibbāna Sutta*.

Primitive dances are often symbolical enactments of events which the people desire to be successfully accomplished. "The Bhils danced at their festivals and before battles. The object was to obtain success in battle by going through an imitation of a successful battle beforehand. The Sola dance of Gond and Bagas in which they perform the figure of the grand chain of the lancers, only that they strike their sticks together instead of clashing hands as they pass, was probably once an imitation of a combat. It is still sometimes danced before their communal and hunting parties." Among the Aengam Nagas, "Dancing singing go hand in hand with ceremonial dress the songs sung include both particular songs traditionally associated with the occasion, and sometimes in archaic language not fully understood except by those skilled in them" or a highly developed song language (Col Hodson, *Primitive Culture of India*).

It is by no means unusual to meet with the folk dances in the

environment of the higher culture. The Sangita Ratnakara, an authoritative work on music and dramatics enumerates 14 varieties. The Tamil *Silappadikaram* enumerates 14 dances of which the majority are for use at the Indra-puja festival and of these several, such as Kottavai dance with a rice measure, are of folk character. We also meet with these folk dances on the classical stage, as in the *Karmanjari* of Bhaskarura we have a circular dance performed by girls, another in which the dancers face each other in two rows, and also the stave dance (*danda rasa*) referred to above. This *danda rasa*, in which the dancers hold short staves in each hand striking them against those of the neighbouring dancer alternately to right and left, is also frequently depicted in decorative temple sculpture (fig. 6). The *rasa* music and other dances of Kṛṣṇa with the milkmaids of Brāhman are of folk character, being constantly represented in paintings of the Rājput school, and are typically circular dances in which the figure of Kṛṣṇa is multiplied. Not infrequently Kṛṣṇa and Rādhā occupy the centre of the field, whirling round with feet together and leaving apart with hands clasped at full arm's length.

MODERN DANCING

Until 1912, modern dancing was a decadent phase of 18th and early 19th century forms. In that year began a new era of popular dancing, in which 20th century industrialized society finally broke away from the courtly steps which had expressed the emotions and social attitudes of another civilization and found new renaissance in a new cultural situation. America led the way in this renaissance. Until the turn of the century, dancing in the United States was a slavish imitation of standardized and well-worn European steps. The polka, schottische, Viennese waltz and cotillon were all favoured by Yankee dancing masters of the 19th century. Sectional groups in the country developed indigenous group dances, such as the Fann Jones and the square dance. But these failed to affect the prevailing trend.

In 1912, coincident with the rise of ragtime and jazz in popular music, the United States gave birth to a new form of dancing whose nervous and gyrating motions were well suited to express the emotions of a mechanical, urbanized civilization. The first jazz dances of this century, the Turkey Trot, Bugle Rag, and Grizzly Bear, were often crude, vulgar and ugly. But the sense of exhilaration and release experienced by the dancer of these steps caused them to sweep the country. Elderly people, as well as boys and girls, were caught up in a dance enthusiasm that writers of that period called the "dance-craze." From then on, dancing was taken over by the common people, and became an authentic expression of their moods and feelings.

Before the World War of 1914 to 1918 Mr. and Mrs. Vernon Castle were the principal exponents of popular dancing. They took the crudeness out of the early jazz steps and introduced the first refinements into ballroom dancing. The most important of their original dances was the Castle Walk, a long-legged walking step in which the lady was backed around the room continuously. The Castles also pioneered when they imported a Spanish-American dance to this country. They introduced the Tango, a sinuous and extremely graceful dance whose point of origin was Argentina. The Tango remained popular until very recent years.

Between 1912 and 1915 new dances sprung up and disappeared in very rapid succession. Of more than one hundred new dances introduced during that time, the Hesitation, to Waltz music, and the Mambo, imported from Brazil, were the most popular. Between 1915 and 1925, with the exception of the Charleston, which had a slight vogue in 1925, no new dance ever achieved any noticeable degree of popularity. The Charleston was most popular as an exhibition dance

by amateurs and was extensively used in musical comedy choruses. The Black Bottom followed on the heels of the Charleston, but it was an ugly dance and short lived.

In 1915 Arthur Murray, a protégé of Vernon Castle, standardized ballroom dancing. He simplified all modern dancing by introducing five fundamental steps. In 1930 Mr. Murray introduced the Westchester style of dancing, popular with college students. This new youthful step called for a sixth basic movement—the Running Step.

The staple dance steps of the present generation are the Waltz and the Fox Trot. After a lengthy popularity, the Tango died out. The Cuban Rumba, an intricate dance, and the Conga are growing in public favor, especially among the more sophisticated circles in large cities. The Rumba is close in nature to the Fox Trot (1920).

Among the younger people of the more moderate economic classes the Shag and the Lindy Hop are popular. These two "jitterbug" dances followed on the heels of the craze for swing music, which developed after 1935 and saw the inception of a second "dance-craze." The Shag is a fast, nervous, hopping dance, performed in time to strongly accented rhythm.

The growing popularity of swing dancing led in 1937 to the first of a series of group-dances. The Big Apple, which swept the United States during 1937, was a culmination of several "jitterbug" steps, including the Shag and the Lindy Hop, as well as the addition of such vivacious movements as the Shimmy, O and Truckin'. The Big Apple, the "caller," an appendage of the 18th century group dancing, came into being again. The Big Apple was generally performed by a group of eight or ten couples, formed into a ring. After a march by the group as a whole, the "caller" would shout for one or another of the swing steps and at each call one of the couples would enter the centre of the ring and perform a figure.

In the summer of 1938, Mr. Murray imported the Lambeth Walk from London. The simplicity of the Lambeth Walk quickly gained it nationwide popularity. Originally, the Lambeth Walk was an old English folk-step, performed in the Limehouse district of London. It was dressed up, polished, refined and brought to America. Essentially, it was a waltz-like dance, done in a jaunty, strutting fashion. After the Lambeth Walk, three other group dances were imported from England in succession: The Palais Glée, Chestnut Tree and Boomp-a Dany. None of them matched the Lambeth Walk in public popularity.

The Fox Trot is still the most widely performed step, probably because its rhythm is simple enough to be easily and quickly learned by beginners, and because its possible combinations of steps are sufficiently varied to hold the interest of the most accomplished.

The Waltz, too, has become a standardized step for modern dancers. People who have learned the Waltz correctly are admittedly the most graceful dancers, and they are able to adopt other steps more readily.

All the modern dances are composed of combinations of the six Basic Steps. Without a thorough knowledge of these Basic Steps, one cannot hope to do any of the modern dances really well. With a knowledge of them, there are practically no combinations, done ordinarily in the Fox Trot and the Waltz, at least, which one should not be able to pick up readily. The six Basic Steps are: The Walking Steps, the Chassé, the Waltz, the Balance and the Pivot and the Running Steps.

Walking Steps Each of the Walking Steps takes up two beats of the music. On the first beat, place the whole foot forward on the floor, toe first, the heel barely touching—if you are doing the man's part. If you are doing the woman's part, reach backward with the toe as far as possible. On the second beat, rise slightly on the toes to give spring and pep to your step, and finish.

Step smartly and lightly, shifting your weight from one foot to the other. When you take a step with one foot, always hit the other off the floor. Never drag or slide the feet along.

Practice taking long, slow steps about the room. Women, in their practice, should give special attention to walking backward. Keep the knees straight and firm and always make the toes lead. Dance as if you did not have a toe but only a great toe. Practice stretching—your toes forward, or backward, as far as you can reach, and always keep them turned out to avoid a pigeon-toed appearance. Always step in a straight line, directly forward, directly back, or directly to the side. This is fundamental to a good balance, good appearance, and a sense of unity with your partner.

The Chassé—The Chassé is a short, quick step directly to the side—either to the right or to the left. For the left Chassé, step directly sideways to the left and draw the right foot up to the left. For the right Chassé, step directly to the right with the right foot and draw the left foot up to the right. Complete the movement with smartness and precision by bringing the feet together so that they actually touch each time.

The Waltz The Waltz is a combination of a Walking Step and a Chassé (in 3-4 time). In the modern Waltz, the accent falls upon the Walking Step, and all the steps are of the same length and value. Practice the Waltz Steps to modern Waltz music, counting out two, three with a definite accent each time on the "top." Or, better still, keep time with the words, "step, side, together," the accent falling upon "step."

The Waltz may be done forward, backward, or used as a turn to left or right. The Waltz may also be danced to Fox Trot music by

holding the first step for two beats, the second and third steps of the Waltz each receive one beat.

The Balance The Balance is a Hesitation. Step forward, back, or to the side with the whole weight upon one foot and rise, point up the free foot forward, back or to the side with the toe just touching the floor. The Balance is used in many combinations in both the Fox Trot and the Waltz. When danced to Fox Trot music, it is given two counts. When danced to Waltz music, it is given three. It is a very graceful step, interesting to do, and, moreover, a sure means of developing a good sense of balance.

The Pivot is simply a particularly graceful and effective way of making a quick turn. Always so that one foot is directly in front of the other. Rock forward, on right foot, bringing the entire weight upon the ball of the forward foot, and spin round making a quarter turn. Rock back on the left foot, and repeat the motion.

The Running Steps are known as syncopated steps because three steps are taken to four beats of the music, you take three quick running steps, then pause on the fourth beat. The syncopated steps are helpful to the lady in following because they teach her to step quickly. This is a decided asset to one who must change her step rapidly in order to follow various partners. Although the running steps are faster than walking steps, they are just as long. It is always best to take long steps, whether they be fast or slow. A short step betrays a lack of confidence.

A man must train his feet by constant practice to do the various steps and combinations automatically in order to inspire confidence in his partner and to lead with that easy nonchalance that is the mark of an accomplished dancer. It is a mistaken idea that the strong leader a man must take a decided lead upon his partner and push and pull her with force about the floor. Hold your partner firmly, yes—especially with your right hand—and then go through your steps with certainty and precision. If she knows the steps she will be able to follow. If she does not no amount of forceful guiding upon your part will be of any help to her.

The Rumba, a graceful and exciting dance step, is based on the Rhythmic rhythm, one, two, three, pause, one, two, three, pause. Because the knees are actively employed in this step, the dancers stand about 8 inches apart. Stand erect, heels together, and relax your weight on the heel of the left foot and at the same time cross your right knee in front of the left. Then shift your weight to the heel of the right foot and cross the left knee in front of the right. Once again shift your weight to the heel of the left foot and cross the right knee in front of the left. Pause after the third count. This is the basic Rumba motion, unique for this dance, and employed in all Rumba steps, whether forward or backward.

The Shag has one main step: step on left foot and hop with left, landing on left. Step on right foot and hop with right, landing on right. Shift weight quickly to left foot, lifting the right foot about two inches off the floor. Shift weight quickly to right foot, lifting the left foot about two inches off the floor.

The Correct Position The best position is the easiest and most natural. Stand erect on the ball of your foot, making yourself as tall as possible. Rest the weight upon the spot that you are not going to use first, leaving the other one free for your initial step. Keep the back straight, the shoulders relaxed, the chest out, head up, chin in, eyes directed over your partner's right shoulder, arms high, at about shoulder height. It is very important to keep the arms well up in dancing. Women who unconsciously allow their arms to sag always seem heavy, even though they may be very light on their feet.

The man holds the woman straight in front of him—never to one side—and firmly, just close enough to enable him to guide her easily. His right hand rests in the middle of her back, just below the shoulder blades. His left arm is extended to the side and bent slightly at the elbow, the left hand holding her hand lightly.

The woman rests her left hand lightly upon the back of the man's shoulder. She should never curl her hand under his arm. Trick holds are out of date. Her right arm is extended to the side in an easy, graceful curve with the right hand resting lightly in the man's. Be careful to avoid a spasmodic clutch. It betrays a tension and a lack of confidence that are destructive to your partner's pleasure in dancing with you.

In starting, the man steps forward directly toward his partner, leading with his left foot. The woman steps directly backward, leading with her right foot. Don't be afraid of stepping on your partner's feet. If you start on the proper foot and in a straight line, directly forward or directly back, you never will get in your partner's way.

There is no fixed sequence for the six Basic Steps or any of their variations. In modern dancing, the leader may swing into any step at any time, as his fancy may dictate or the music seems to suggest. This is why it is so extremely important that the woman should be thoroughly familiar with the steps her partner may decide to do. The only way to gain confidence and to overcome self-consciousness, awkwardness, and stiffness in dancing is to learn the steps and by-constant practice to master them so perfectly that you could almost do them in your sleep.

Self-assurance, ease, grace, and relaxation come as a natural consequence of knowing how. Self-consciousness, stiffness, awkwardness will vanish, and you will find yourself dancing with ease and spontaneity.

DANCOURT, FLORENT CARTON (1661-1725), French dramatist and actor, was born at Fontainebleau on Nov. 1, 1661. In 1685, in spite of the strong opposition of his family, he appeared at the Theatre Français. One of his most famous impersonations was Alceste in the *Misanthrope* of Moliere. His first play, *Le Notaire obligé*, produced in 1685, was well received. *Le Désolation des jeunes* (1687) was still more successful. *Le Chevalier à la mode* (1687) is generally regarded as his best work, though his claim to original authorship in this and some other cases has been disputed. In *Le Chevalier à la mode* appears the bourgeoisie infatuated with the desire to be an aristocrat. The type is developed in *Les Bourgeoises à la mode* (1692) and *Les Bourgeoises de qualité* (1700). Dancourt was a prolific author, and produced some 60 plays in all. He died on Dec. 7, 1725. The plays of Dancourt are faithful descriptions of the manners of the time, and as such have real historical value. Most of them incline to the type of farce rather than of pure comedy.

See *Oeuvres complètes* (13 vols., 1760), *Théâtre choisi*, ed. F. Sarcey (5 vols., 1884). Also J. Lemaître, *La comédie après Molière et le théâtre de Dancourt* (2nd ed., 1903).

DANDELION (*Taraxacum officinale*) and related species, perennial herbs belonging to the family Compositae (*g* v). The plant has a wide range, being found in Europe, Central Asia, North America and the arctic regions, and also in the south temperate zone. The leaves form a spreading rosette on the very short stem, they are smooth, of a bright shining green, sessile and tapering downwards. The name dandelion is derived from the French *dent de lion* (lion's tooth), an appellation given on account of the toothlike lobes of the leaves. The long taproot has a simple or many headed rhizome, it is very difficult to eradicate. The flower stalks (scapes) are smooth, leafless, hollow and numerous. The flowers bloom from April until August. The flower heads are golden yellow, and reach $\frac{1}{4}$ to $\frac{1}{2}$ in width, the florets are all strap shaped. The fruits are olive or dull yellow in colour, and are each surmounted by a long beak, on which rests a pappus of delicate white hairs, which occasions the ready dispersal of the fruit by the wind, each fruit contains one seed. The globes formed by the plumed fruits are nearly 2 in in diameter. The involucre consists of an outer spreading (or reflexed) and an inner and erect row of bracts. In all parts of the plant a milky juice is present. The root externally is brown and wrinkled, internally white, with a yellow centre and concentric paler rings. It is 2 in to 1 ft long, and about $\frac{1}{4}$ in to $\frac{1}{2}$ in in diameter. The leaves are bitter, but

DANDELION SHOWING THE LEAVES THAT ARE EATEN AS SALAD. THE ROOT IS USED FOR MEDICINAL PURPOSES

- 1 Unopened head
- 2 Ripe head, from which all the winged seeds except two have been removed
- 3 Ripe head, from which all the winged seeds except two have been removed

are sometimes eaten as a salad or are cooked for potheys, they serve as food for silkworms when mulberry leaves are not to be had.

The root is roasted as a substitute for coffee. Several species and varieties of the dandelion are recognized by botanists, they differ in the degree and mode of cutting of the leaf margin and the erect or spreading character of the outer series of bracts.

The red seeded dandelion (*T. laevigatum*), a native of Europe, very similar to the common species but smaller, with red, shorter beaked fruits and more deeply and finely cut leaves, is widely naturalized in the United States and Canada.

Russian dandelion, *Kok saghyz* (*T. kok saghyz*), was found in 1931 around Tien Shan, Kazakstan, near the China border. It is a perennial with roots about $\frac{1}{2}$ in in diameter, producing rubber in the latex tubes. After 1931 it became a commercial source of rubber in the USSR. It was introduced into the United States in 1942 and experimental plantings were made in several states to determine its possibility as a source of rubber.

(W C M, X)

DANDIN (fl. 6th century AD), Sanskrit author and court poet of Sudraka. He wrote the *Kavyadarsa*, a manual of poetics (Sanskrit text and Eng. trans. by S. K. Belvalkar, 1924), and *Daskumaracharita*, or "adventures of the ten princes," portraying low class city life (latest Sanskrit and English edition published at Bombay, India, 1919).

DANDOLO, the name of one of the most illustrious patrician families of Venice, of which the earliest recorded member was one of the electors of the first doge (AD 697). The Dandolo gave to Venice four doges, of these the first and most famous was Enrico Dandolo (c. 1120-1205), elected on Jan. 1, 1193 (*more Veneto*, 1192). Although over 70 years old and of weak sight (the story that he had been made blind by the emperor Manuel Comnenus while he was at Constantinople is a legend), he proved a most energetic and capable ruler. He re-established Venetian authority over the Dalmatians who had rebelled with the king of Hungary's protection, but he failed to capture Zara, owing to the arrival of the Pisan fleet, and although the latter was defeated by the Venetians, the undertaking was suspended. In the meanwhile the eastern emperor Isaac II (Angelus) had been deposed, and the new emperor Alexius was unfriendly to the Venetians. Dandolo therefore listened to the proposals of the crusaders who asked Venice for free passage and the means of transport. Dandolo subsidized the crusaders heavily and, with a promise that payment would be deferred, persuaded them to turn aside and assist him in the reduction of Zara. Dandolo himself commanded the expedition, and Zara was taken and sacked. He then induced the crusaders to listen to the proposals of Isaac's son, Alexius, for the dethronement of the emperor Alexius. The fleet wintered at Zara and then, under Dandolo's command, sailed for the Bosphorus. For the capture and sack of Constantinople and the erection of the Latin empire, see **CRUSADES**.

Immense booty was secured, the Venetians obtaining among other treasures the four bronze horses which adorn the façade of St Mark's. Dandolo was one of the candidates for the imperial throne of the new Latin empire, but Count Baldwin of Flanders was elected and crowned on May 23. The Venetians were given Crete and several other islands and ports in the Levant, which formed an uninterrupted chain from Venice to the Black sea, a large part of Constantinople (whence the doge assumed the title of "lord of a quarter and a half of Romania"), and many valuable privileges. But hardly had the new state been established when various provinces rose in rebellion and the Bulgarians invaded Thrace. A Latin army was defeated by them at Adrianople (April 1205), and the emperor himself was captured and killed, the fragments of the force being saved only by Dandolo's prowess. But he was now old and ill, and on June 23, 1205, he died.

Enrico Dandolo's sons distinguished themselves in the public service, and his grandson Giovanni was doge from 1280 to 1289. The latter's son Andrea commanded the Venetian fleet in the war against Genoa in 1294 and, having been defeated and taken prisoner, he was so overwhelmed with shame that he committed suicide by beating his head against the mast (according to Andrea

Navagero) Francesco Dandolo, also known as Dandolo Cane, was doge from 1329 to 1339. During his reign the Venetians went to war with Martino della Scala, lord of Verona, with the result that they occupied Treviso and otherwise extended their possessions on the *terra firma*. Andrea Dandolo (c. 1307-1354), the last doge of the family, reigned from 1343 to 1354. He had been the first Venetian noble to take a degree at the university of Padua, where he had also been professor of jurisprudence. The terrible plague of 1348, wars with Genoa, against whom the great naval victory of Leros was won in 1353, many treaties, and the subjugation of the seventh revolt of Zara, are the chief events of his reign. The poet Petrarch, who was the doge's intimate friend, was sent to Venice on a peace mission by Giovanni Visconti, lord of Milan. "Just, incorruptible, full of zeal and of love for his country, and at the same time learned, of rare eloquence, wise, affable, and humane," is the poet's verdict on Andrea Dandolo (*Variorum epist. xix*). Dandolo died on Sept. 7, 1354. He is chiefly famous as a historian, and his *Annals* to the year 1280 are one of the chief sources of Venetian history for that period; they have been published by Muratori (*Rer. Ital. Script. tom. xxi*). He also had a new code of laws compiled (issued in 1346) in addition to the statute of Jacopo Tiepolo. Another well known member of this family was Silvestro Dandolo (1796-1866), son of Girolamo Dandolo, who was the last admiral of the Venetian republic and died an Austrian admiral in 1847. Silvestro was an Italian patriot and took part in the revolution of 1848.

BIBLIOGRAPHY—S. Romann, *Storia documentata di Venezia* (Venice, 1853), among other books H. Kretschmeyer's excellent *Geschichte von Venedig* (Gotha, 1905) should be consulted; it contains a bibliography of the authorities and later researches and discoveries; C. Cipolla and G. Montuolo published many essays and editions of chronicles in the *Archivum Veneto*, and the "Fonti per la Storia d'Italia," in the *Istituto storico italiano*, H. Simonsfeld wrote a life of Andrea Dandolo in German (Munich 1896).

DANDOLO, VINCENZO, COUNT (1758-1819), Italian agricultural chemist, a native of Venice, welcomed the advent of Napoleon in Italy (1796), and was a member of the grand council of the Cisalpine Republic at Milan. From 1805-09 he was governor of Dalmatia, where he sought to improve agriculture. He died at Venice on Dec. 13, 1819. Dandolo wrote several treatises on agriculture, vine-cultivation, and the rearing of cattle and sheep, and a work on silkworms, which was translated into French by Fontanelle.

DANDURAND, RAOUL (1861-1942), Canadian lawyer and statesman, was born on Nov. 4, 1861, at Montreal. Educated at Montreal college and Laval university, he was admitted to the bar in 1883. He applied himself to the local organization of the Liberal party, was called to the senate in 1898, being speaker 1905-09, and was minister without portfolio in the cabinet of 1926-30. His chief work is *Traité théorique et pratique de droit criminel* (Montreal, 1890). He was president of the 6th Assembly of the League of Nations. Dandurand died March 11, 1942.

DANDY, a word which about 1813-16 became a London colloquialism for the exquisite of the period. It is probably derived from the French *dandin*, "a nunny or booby," but in the *Northampton Mercury* (April 17, 1819), occurs the following "Origin of the word 'dandy'." This term, which has been recently applied to a species of reptile very common in the metropolis, appears to have arisen from a small silver coin struck by King Henry VII, of little value, called a *dandprat*, and hence Bishop Fleetwood observes the term is applied to worthless and contemptible persons."

It was Beau Brummell, the high priest of fashion, who gave dandyism its great vogue, though it existed before his day. About the middle of the 18th century was founded the Macaroni club. This was a band of young men of rank who had visited Italy and sought to introduce the southern elegances of manner and dress into England. Their costume is described as "white silk breeches, very tight coat and vest, with enormous white neckcloths, white silk stockings and diamond buckled, red heeled shoes." For some time the moving spirit of the club was Charles James Fox. It was with the advent of Brummell, however, that the cult of dandyism became a social force. Beau Brummell was supreme dictator in

matters of dress, and the Prince Regent is said to have wept when he disapproved of the cut of the royal coat. Around the Beau collected a band of young men whose insolent and affected manners made them universally unpopular. Their chief glory was their clothes. They wore coats of blue or brown cloth with brass buttons, the coat tails almost touching the heels. Their breeches were buckskin, so tight that it is said they "could only be taken off as an eel would be divested of his skin." A pair of highly-polished Hessian boots, a waistcoat buttoned incredibly tight so as to produce a small waist, and opening at the breast to exhibit the frilled shirt and cravat, completed the costume of the true dandy.

See Barbery D'Aureville, *Du dandysme et de G. Brummell* (1887), Sir A. Conan Doyle, *Rodney Stone* (1896).

DANEGLD, an English national tax originally levied by Aethelred II as a means of raising the tribute which was the price of the temporary cessation of the Danish ravages. This expedient was first adopted in 991 and was repeated in 994, 1002, 1007 and 1012. With the accession of the Danish king Canute, the original *raison d'être* of the tax ceased to exist, but it continued to be levied, though for a different purpose, assuming now the character of an occasional war tax. It was, apparently, not levied by Edward the Confessor in the latter part of his reign, but William the Conqueror revived it immediately after his accession, and it was with the object of facilitating its collection that he ordered the compilation of Domesday Book. It continued to be levied until 1163, in which year the name Danegeal appears for the last time in the Rolls. Its place was taken by other imposts of similar character but different name.

DANELAGH, the name given to those districts in the north and northeast of England which were settled by Scandinavian invaders in the 9th and 10th centuries and in which Danish customsary law subsequently prevailed. The real settlement of England by Danes began in the year 876, when a division of the great army, which had been ravaging widely over England, divided out Northumbria among its members. Next year, another portion of the same army divided out Eastern Mercia and in 880 so much of the army as remained in England divided out East Anglia. A similar division of Wessex had been prevented by the victories of King Alfred (*q.v.*), and between 880 and 890 definite boundaries were drawn between Alfred's kingdom and that of Guthrum, king of East Angles and Danes. The boundary thus drawn ran along the Thames estuary to the mouth of the Lea (a few miles east of London), then up the Lea to its source, then due north to Bedford, then up the Ouse to Watling street at Stony Stratford. From this point the boundary is left undefined, perhaps because the kingdoms of Alfred and Guthrum ceased to be contentious here. Thus Eastern Mercia, Northumbria from Tees to Humber, East Anglia, and the shires to the immediate west and south were handed over to the Danes and henceforth constitute the district known as the Danelagh.

The three chief divisions of the Danelagh were (1) the kingdom of Northumbria, corresponding, roughly, to the modern Yorkshire, (2) the kingdom of East Anglia, (3) the district of the five (Danish) boroughs—lands grouped round Leicester, Nottingham, Derby, Stamford and Lincoln. Of the history of the two Danish kingdoms we know very little. Guthrum of East Anglia died in 890, and later we hear of a King Eric or Eohric, who died in 902. The history of the Northumbrian kingdom is yet more obscure. The original Danish kingdom seems to have come to an end in 909, but within a decade this region was overrun by fresh invaders of Norwegian rather than Danish extraction, and Northumbria was not brought definitely under English rule before the middle of the 10th century.

More is known of the history of the five boroughs. From 907 onwards Edward the Elder, working together with Aethelred of Mercia and his wife, worked for the recovery of the Danelagh. In that year Chester was fortified. In 911-912 an advance on Essex and Hertfordshire was begun. In 914 Buckingham was fortified and the Danes of Bedfordshire submitted. In 917 Derby was the first of the five boroughs to fall, followed by Leicester a few months later. In the same year after a keen struggle all

the Danes belonging to the 'borough' of Northampton as far north as the Welland (i.e., the border of modern Northamptonshire) submitted to Edward and at the same time Colchester was fortified, a large portion of Essex submitted and the whole of the East Anglian Domes came in. Stamford was the next to yield, soon followed by Nottingham, and in 970 there was a general submission on the part of the Danes.

Although the independent existence of the Danehalg did not last for half a century, it profoundly affected the later history of this region. It was subsequently distinguished by a large population of free peasant landowners, who undoubtedly represent the descendants of the Danish settlers of the viking age. The signs of Scandinavian occupation are particularly evident in Yorkshire and the territory of the five boroughs, where land was divided into ploughlands and oxgangs instead of hides (*q.v.*) and yardlands, where the Scandinavian *wentake* replaces the English hundred (*q.v.*) and where many traces of Scandinavian methods of monetary and fiscal computation survived into the middle ages. For at least two centuries the language of this region must have been a Scandinavian dialect, gradually modified by English influences from the south. In the early 12th century the legal custom of the Danehalg was sharply distinguished from the customs of Wessex and English Mercia, and to the present day a Scandinavian institution, the riding, survives, in the three ridings of Yorkshire. A number of Danish place names still exist in the original Danehalg.

See J. C. H. R. Steenstrup, *Normannerna*, 4 vol. (1876-82), P. Vinogradoff, *English Society in the Eleventh Century* (1908), F. M. Stenton, *Danelaw Charters* (1920) and *The Danes in England* (Oxford, 1977). The place names of this region are discussed by E. Ekwall in the *Introduction to the Survey of English Place Names*, pt. 1, ch. iv (1924) (A. M., F. M. S.).

DANGERFIELD, THOMAS (c. 1650-1683), English conspirator, was born at Waltham, Essex, the son of a farmer. He began his career by robbing his father, and, after a wandering life on the continent, took to coming false money, for which offense and others he was many times imprisoned. Faithless to everyone, he first tried to involve the duke of Monmouth and others by concocting information about a Presbyterian plot against the throne, and, this having been proved a lie, he pretended to have discovered a Catholic plot against Charles II. This was known as the "Mealtub plot," from the place where the incriminating documents were hidden at his suggestion, and found by the king's officers by his information. Elizabeth Cellier—in whose house the tub was—almoner to the countess of Powis, who had befriended Dangerfield when he posed as a Catholic, was, with her patroness, actually tried for high treason and acquitted (1680). Dangerfield, when examined (Oct. 26, 1680) at the bar of the house of commons, made other charges against the duke of York, the countess of Powis and the earl of Peterborough. He continued to defame the Roman Catholics in a long series of pamphlets, among others being *Dangerfield's Narrative*. This led to his trial for libel, and on June 29, 1685, he received sentence to stand in the pillory on two consecutive days, be whipped from Aldgate to Newgate, and two days later from Newgate to Tyburn. On his way back he was struck in the eye with a cane by a barrister, Robert Francis, and died shortly afterward from the blow. The barrister was tried and executed for the murder.

DANGEROUS TRADES Work whether laborious, sedentary or studious, involves adverse influences on health. The effects may appear immediately, as in accidents, or insidiously over years, as in occupational diseases. Some employments, however, involve special risks, and in Great Britain these are designated dangerous trades. (For a discussion of the subject in the United States, see **INDUSTRIAL ACCIDENTS**, **INDUSTRIAL MEDICINE**.) This experience is marked in common speech in such allusions as painters' colic (lead poisoning), potters' rot (silicosis), mad as a hatter (mercurial poisoning) and mule spinners' cancer. In Great Britain, under the Factories act, 1937, dangerous trades are officially recognized by a requirement for statutory periodic medical examination of certain workmen exposed to the risk of lead poisoning in such diverse occupations as the manufacture of pottery, electric accumulators and rubber; toxic anaemia in nitro and amido processes, chrome ulceration in chromium plating, skin cancer in

patent fuel workers, and many others. Employers voluntarily supplement these arrangements in a wide variety of occupations including exposure to mercury, mineral oil pitch and tar and complex organic chemical compounds. The danger is reflected either as accidents or specific trade diseases and statistically by excessive morbidity and mortality generally or particularly from special causes.

In relation to each census the registrar general publishes a decennial supplement on occupational mortality, which directs attention to the unfavourable state of certain occupational groups and to excessive mortality among them from particular diseases. In the report of 1875 William Farr wrote, "earthenware manufacture is one of the unhealthiest trades in the country," and in 1885 W. Ogilvie added, "this excessive mortality is in the greatest part due to phthisis and diseases of the respiratory organs." At attention was thus focused on the risks of hroud phthisis (later silicosis, now pneumoconiosis, *q.v.*) and plumbism among pottery workers. Similarly later decennial supplements emphasized the serious excess of mortality from respiratory diseases (silicosis and tuberculosis) in tin miners, metal grinders and sand blasters, and cancer in gas workers. Occasionally the peculiar hazards of a particular industry or occupation are dramatically revealed by a disaster, e.g., a colliery explosion, failure of a submarine to surface, bursting of a ladle of molten metal, men overcome by fumes in dry cleaning, men blinded by chemicals in a dyehouse. These incidents are accidents. Occurrence of trade diseases is less spectacular and frequently is discovered only after years of observation and research in the group, as, for example, bladder cancer in workers in the dyestuffs industry, scrotal epithelioma in cotton mule spinners, fibrosis of the lungs in asbestos workers, blood diseases among workers exposed to X rays, and degeneration of the liver from the toxic effects of benzene compounds. Furthermore, many cases of trade diseases, when first diagnosed, have reached a serious stage. Little is known of the ill effects and signs of small continued exposures to toxic chemicals, and even when such disease is suspected doctors lack specific tests to identify the pathological changes. This means that against every diagnosed case of occupational disease there may be many incipient cases from the same causes. Nevertheless it is important to avoid the mistake that accidents and diseases caused by employment are major causes of sickness and incapacity. It is generally estimated that they constitute only 10% of all sickness. In 1951 under the main National Insurance act spells of sickness amounted to 7,000,000, whereas under the Industrial Injuries act there were 720,000 new wards for injuries by accident and about 50,000 for prescribed occupational diseases. Sickness cost £68,000,000 in benefits, industrial accidents and diseases cost £14,000,000.

The Factories act, 1937, requires that notification shall be made to the inspector of factories of all accidents at work which cause loss of life or disable a workman for more than three days from earning full wages at the work at which he was employed. During 1951, 182,216 reportable accidents occurred in factories among approximately 7,000,000 workers—a rate of 26 per 1,000. In addition there were 828 fatal accidents. As a means of measuring the comparative incidence of accidents in separate industries, use is made of the frequency rate, which takes account of the number of lost time accidents (that is, those involving loss of time beyond the day or shift in which the accident occurred) and also of the number of man hours worked during the year. The formula is

$$\frac{\text{total number of accidents} \times 100,000}{\text{total man hours worked}}$$

Table I, abbreviated from the annual report of the chief inspector of factories for the year 1951, presents the situation in a few selected industries. The data do not represent all firms but only those which co-operated with the factory department by making voluntary returns. As the figures refer mainly to factories where special attention is given to accident prevention, they are certainly lower than would be the case if comprehensive figures were available. They do, however, indicate broadly the trend in various industries between 1948 and 1951. For the 29 industries in the original table, covering 1,740,400 persons, the frequency rate

TABLE I—Frequency Rate of Accidents in Factories in Great Britain

Industry	Estimated number employed				Number of factories				Frequency rate			
	1948	1949	1950	1951	1948	1949	1950	1951	1948	1949	1950	1951
Printing	13,200	33,600	27,000	27,000	14	42	31	36	0.73	0.70	0.74	0.62
Engineering, light electrical and radio	52,400	50,800	55,500	81,000	45	43	47	56	0.96	0.88	0.80	0.92
Chemicals, industrial	48,400	50,100	60,300	85,100	47	52	63	86	1.75	2.05	2.30	1.17
Engineering, general and heavy	287,800	452,400	440,400	412,000	202	398	414	419	1.65	2.20	2.07	1.72
Shipbuilding and repairing	56,700	82,700	57,500	62,100	25	41	31	31	2.55	3.16	3.12	1.00
Building, operations	27,400	36,300	38,100	51,800	5*	74	77	101	3.51	1.22	3.05	3.13
Iron and steel founding in pits	17,200	16,500	16,200	7,100	11	34	20	15	5.28	0.75	0.47	5.95

was 1.70 and in the range of 0.62 in printing and 5.95 in tin plate.

The dangers and hardships endured by coal miners are greater than in any other major industry. The death rate from accident is nine times as high as in factories, and the general accident rate is six times as high. Average absenteeism from unavoidable causes—most of it caused by injury or sickness—is around 7% per annum, equivalent to the whole working time of 50,000 miners. In statistics of accidents in coal mining a person is included as "temporarily injured" if he is "seriously injured," when any accident occurs which either (1) causes any fracture of the head or of any limb, or any dislocation of a limb or any serious personal injury, or (2) is caused by any explosion of gas or coal dust or any explosive, or by electricity or by overwinding. In 1950 total underground and surface accidents amounted to 134.47 per 100,000 man shifts, of which death represented 0.28 and reportable injury 1.13.

TABLE II—Manpower and Accidents at Mins in Great Britain Under the Coal Mines Act, 1911

Year	Persons employed (total)	Man shifts worked (in 100,000)	Number of persons killed and reportably injured		
			Killed	Reportably injured	Total
1910	769,400	21.1	923	1,137	4,100
1945	725,051	186.0	491	2,153	903
1950	721,320	177.6	450	200	2,514

In addition to this heavy toll of accidents, coal miners suffer inordinately from many serious incapacitating occupational diseases, as shown in Table III. Pneumoconiosis, or dust disease of the lungs,

TABLE III—Centenares of Disablement From Industrial Diseases to Coal Miners in Great Britain

Year	Pneumoconiosis	Nyctinosis	Heat diseases	Inflammation of wrist	Dermatitis	Other diseases	Total	Persons employed
1940	484	1,076	8,132	3	402	7	8,395	791,400
1945	582	1,370	8,841	468	1,867	12	12,810	725,051
1950	4,270	148	10,707	975	1,113	14	18,447	721,320

is the greatest and most complex problem. The disease results from the inhalation of minute particles of mine dust and chiefly affects skilled underground workers. Machine methods of mining have substantially increased dustiness in the pits. Strenuous and effectual efforts are being made to control the amount of dust by such methods as water infusion of the strata at the working faces. The alarming rise in the number of cases after 1940 is partly explained by the fact that until July 1941 only silicosis, a particular variety of pneumoconiosis, was liable for compensation. After that under compensation legislation, pneumoconiosis had a much wider connotation and so embraced many cases of lung disease previously excluded. The disease—even as it is present defined—is incurable and, indeed, in certain "infective cases" tends to progress. Its course is usually prolonged and associated with incapacity for work. The "heat" diseases mean an inflammation of the underlying cellular tissue following septic infection of abraded surfaces of the hands, knees or elbows. Heat knee—a crippling condition—accounts for about 70% of all cases.

An excess of accidents also occurs to seamen and dock labourers, while increasing mechanization in agriculture foreshadows a rise in serious accidents among farm workers.

Occupational diseases, apart from pneumoconiosis, are uncommon as a cause of death or disabling sickness. Poisoning by lead, mercury, arsenic and phosphorus (lucifer match manufacture) prevailed in the early part of the 20th century but as a result of preventive measures these dangers were eradicated or substantially diminished. The present is dominated by pneumoconiosis, particularly in coal miners, foundry and pottery workers, dermatitis in engineering tradesmen, epitheliomatous ulceration in pitch and tar workers and workers exposed to contact with mineral oils. To expedite prompt investigation and preventive measures certain occupational diseases and allied conditions are notifiable to the chief inspector of factories. Table IV shows the trend in four major conditions since 1900.

Pneumoconiosis and industrial dermatitis, which constitute the most serious problems, are not notifiable, statistics of these are derived from claims under the Industrial Injuries Act. The remarkable fall in

lead poisoning is largely attributable to displacement of full lead glazes by leadless or low solubility lead glazes in pottery manufacture. Ship building caused 27 of the 57 cases in 1950. In this industry the disease is caused by the inhalation of lead fume arising from the burning of

TABLE IV—Trends in Four Major Occupational Disease Conditions in Great Britain

Disease	Reported cases (supernumerary indicate deaths)				
	1900	1910	1920	1930	1950
Lead poisoning	1,050	1,050	594	614	57
Aniline poisoning				1	1
Epidemiological observation				10	10
Chronic ulceration	1	1	1	1	1

lead paint and stoppings by the acetone touch in the "cutting" of the hull. Cases should diminish as the breaking up of obsolete warships—the main source of danger—declines. Epitheliomatous ulceration—almost entirely in pitch and tar workers—remains a serious problem. Periodical examination leading to earlier and more accurate diagnosis may account for the sustained level of notified cases but should ultimately achieve effective control of the risk. Anthrax, formerly a serious risk in the woollen trades, was considerably diminished by the effective treatment of certain imported wools at the government disinfecting station at Liverpool.

Complex chemical compounds have increasingly been used in the form of sprays, dusts and aerosols for the protection of fruit and field crops. Several of these substances notably parathion, an organic phosphorus insecticide, and di-nitro ortho cresol (DNOC), an ovicide and weed killer, proved extremely noxious indeed rapidly fatal, to workmen employed in spraying operations. Manufacturers and firms engaged in the treatment of crops instituted effective measures for the safety of their workmen.

The dangers of atomic energy are well recognized at atomic energy plants, in industry, where increasing use is being made of radioactive isotopes, and in hospitals. Preventive measures, however, are rigorously enforced and have achieved almost complete control. In like manner flying at high altitudes and at speeds faster than sound involves, excluding accidents, considerable risks to the physical and mental health of air crews. Aviation medicine has become a science in which physiologists, at such research stations as Fairbrough, Eng., have made notable contributions to the health and safety of crews and passengers.

The real significance of dangerous trades is their call to unremitting vigilance, anticipation of danger and urgent preventive action. This is mainly an engineering problem, but the physician in industry can make a substantial contribution. (See also WORKMEN'S COMPENSATION.)

DANIEL, the name given to the central figure of the biblical book of Daniel (see below). Two other personages mentioned in the Old Testament bear this name, see I Chron. 11, 1, Ezra viii, 2, Neh. x, 6. Daniel the prophet is known to us only as a character in Jewish fiction. He is mentioned in Ezek. xiv, 14, 20, between Noah and Job, as one of three foremost saints of Israel, and in xxviii, 3, as the type of wisdom. This may mean either that such stories as those in our book of Daniel were in circulation as early as the 6th century B.C., or (in the present writer's opinion)

much more probably that the book of Ezekiel was written in the 3rd century B.C. (see below)

According to Dan 1, 3, the Babylonian chief eunuch was commanded to bring to the court certain youths of the Judean captivity, "of the children of Israel, and of the king's seed, and of the nobles," to serve in the king's palace. It is apparent that Daniel is thought of as one of the nobles, or even of the royal line. Thus Josephus, *Ant.* x, 10, 1, and the *Lives of the Prophets* (various Greek recensions), the latter adding that his birthplace was Upper Beth Horon, and that he was burned in the royal vault in Babylonia. In the biblical account, the earlier narrator says that his life extended "to the first year of king Cyrus" (1, 21, cf. vi, 29), while the later author represents him as still living "in the third year of Cyrus" (x, 1). In the late rabbinical tradition (*Midr. Su ha širim* vii, 8) he is said to have returned to Jerusalem among the exiles freed by the royal edict. The Jewish traveller Benjamin of Tudela (12th cent. A.D.) was shown his tomb in Susa, and notices of this tomb are found as early as the 10th century.

Daniel, Book of.—The Book of Daniel stands between Esther and Ezra in the third great division of the Hebrew Bible known as the *Hagiographa*, in which are classed all works which were not regarded as forming part of the Law or the Prophets.

The book consists of two widely different portions—a didactic and popular narrative in successive episodes, chaps. i-vi, and a series of prophetic visions, chaps. vii-xii. Chaps. i-vi are in Aramaic, the remainder is Hebrew. The unity of the whole has been maintained by the great majority of scholars (Bevan, *Comm.*, pp. 6, 23 note). Recently, however, theories of composite authorship have gained ground, see Dalman, *Worte Jesu* (1898), p. 11, and the works named below. The differences between the two parts are indeed many and striking, notably in the following particulars: (1) Style, irrespective of the changes in language and subject matter. In the first half, including the Hebrew chapter 1, it is generally simple and without any unusual features, in the second half it is obscure and difficult to a remarkable degree. (2) In the mental attitude of the author, and his portrayal of the character of Daniel, there is a profound difference to be seen. (3) The Persian words, so numerous in i-vi, are entirely absent in vii-xii. (4) There is nothing in the first half of the book to suggest the presence of the arch enemy, Antiochus Epiphanes, always in the background of the second half, contrast 21, 39-43 with vii, 23-25. (5) There is a manifest contradiction between 1, 21 (cf. vi, 28), the statement that Daniel "continued until the first year of Cyrus," and x, 1, the account of the vision in that king's third year. It is natural to suppose that a later author had in mind the words of vi, 28, but forgot, or chose to disregard, those of 1, 21. (6) The use of the two languages finds its only convincing explanation in the theory of dual authorship (see following).

The great majority of scholars at the present day agree that neither the whole book nor the first half, containing the narratives, can have been written in the time of the Babylonian monarchy, or even in the earlier part of the Persian period. The chief reasons for this conclusion are the following:

1 The position of the book among the *Hagiographa* seems to show that it was introduced after the final collection of the "Later Prophets" had been made. The collectors of the prophetic writings, who in their care did not neglect even the parable of Jonah, would hardly have ignored the record of so great a prophet and foreteller of future events as Daniel is represented to have been.

2 Jesus ben Sirach (Ecclesiasticus), who wrote about 180 B.C., in his otherwise complete list of Israel's leading spirits, makes no mention of Daniel.

3 The internal evidence is even stronger than the external, as will appear in the particulars which here follow. The historical inaccuracies in the narrative chapters are such as could be credited only to a writer who lived long after the events described. The statement at the very beginning of the book, that "in the third year of the reign of Jehoiakim" Nebuchadnezzar besieged and captured Jerusalem, and carried the Jewish king and the vessels

of the temple to Babylon, finds no support in the history known to us, but seems to be the work of a writer who combined II Chron. xxxvi, 6 f. with II Kings xxv, 1. The use of *Kaddim*, 'Chaldeans,' as the name of a class of magicians is a striking anachronism (see CATALDRAE), and the position of Daniel, a devout Israelite, as "the master of the magicians" at the Babylonian court (iv, 6) is more easily comprehensible in edifying romance than in actual history.

The four kingdoms of chap. ii introduce a still greater difficulty. The first kingdom is the Babylonian (vs. 38), the fourth is the Greek empire (cf. chap. viii), the third, immediately preceding the Greek (viii, 20 f., x, 20), is the Persian. The identity of the second kingdom is then made certain by numerous passages: it is the kingdom of the Medes, whose reigning king, called 'Darius the Mede,' took possession of Babylonia upon the death of Belshazzar, and at the close of his reign was succeeded by Cyrus (v, 30, vi, 1, 29, cf. ix, 1, x, 1, xi, 1). There was, however, in fact no Median power which came 'after' the Babylonian (ii, 39) and in turn yielded the throne of Babylonia to the Persians (xi, 1). The name Darius is not Median, and we have certain knowledge that the immediate successor of Nabonidus and Belshazzar as ruler of Babylonia was Cyrus. Comparison with the list of Persian kings in the book of Ezra seems to show that in the last centuries B.C. the Jewish learned tradition transposed the reign of Cyrus with that of Darius I Hystaspis, the latter being regarded as king of the Medes. The reign of Cyrus was believed to have been immediately followed by those of Xerxes and Artaxerxes, Ezra iv, 5 (where the reference is to Darius II Nothus), 6, cf. Montgomery, *Comm.*, p. 423 (See EZRA and NEHEMIAH, BOOKS OF).

The highly interesting narratives of Nebuchadnezzar and Darius can hardly be regarded as true pictures of these monarchs. The former erects a golden image and commands all the people in his realm to fall down and worship it at a given signal, afterwards he confesses the God of Israel, and decrees that any subject of his who shall say anything against this God shall be cut in pieces. Darius commands by royal statute that "whosoever shall ask a petition of any god or man for 30 days," save of the king himself, shall be cast into the den of lions. After Daniel's rescue, the king confesses the God of Israel, and writes to all the peoples, nations and languages, commanding them to fear this living God, whose dominion is everlasting. All this is plainly popular narration rather than historical record, even though one and another of the items have an undoubted basis of fact. The picture of Belshazzar in chap. v has quite generally been pronounced unhistorical by modern scholars, but recent discoveries have tended to show that the historical background of the chapter is substantially correct. Documents in cuneiform prove that Belshazzar, the son of Nabonidus, exercised at Babylon such administrative powers as belonged to no mere crown prince, indeed, it is expressly stated that in the third year of Nabonidus the king entrusted the kingship to his eldest son, Belshazzar (Sidney Smith, *Babylonian Historical Texts*, 1924, pp. 84 sqq.). This would seem to explain the dignity of "the third ruler in the kingdom," conferred upon Daniel. Whether, and in what way, Belshazzar could be correctly described as the lineal descendant ("son") of Nebuchadnezzar is a question which future discoveries may settle.

4 The late date of the second half of the book, chaps. vii-xii, is evidenced in many ways, not merely by the fact that its author presents a detailed sketch of contemporary history, especially in chap. xi, extending down to the time subsequent to the desecration of the temple at Jerusalem by Antiochus Epiphanes. In both literary and religious character it is a product of the late Greek period. The "apocalypse" as a distinct branch of Jewish literature makes its first appearance at this time, in the books of Daniel and Enoch, and continues henceforth in many similar compositions, its most characteristic features clearly represent a late stage in the history of Jewish thought. See the article "Apocalypse" in the *Jewish Encyclopedia*, Montgomery, *Comm.*, 78-85. The way in which Daniel in ix, 2, refers to the authoritative scriptures naturally suggests a time subsequent to the final redaction of the Law and the Prophets. A like impression is given by the

angelology of the visions, including the names of the archangels Gabriel and Michael (cf. the book of Tobit). The doctrine of the resurrection, xii 2, appears now for the first time in clear and definite form (it had already received expression in Is xxvi 19). Not only the resurrection of the righteous but also that of at least a part of the wicked among the Jews is predicted, and the fact well illustrates the growing prominence of the individual, as contrasted with the nation, in the type of theology here represented. Some scholars have seen in this doctrine, as well as in other features of the theology of the book, evidence of the influence of Zoroastrianism (thus Kohut, Bousset, and especially Eduard Meyer, *Ursprung und Anfänge des Christentums*), but the arguments in support of this theory are unconvincing.

5 Finally, the linguistic evidence points unequivocally to a date more than two centuries later than the supposed time of the prophet Daniel. Comparison of the language of the sufficiently abundant inscriptions and papyri shows beyond question that the Aramaic of Dan ii-vii represents a type which cannot possibly be carried back of 300 B.C. (Torrey, *Esra Studies*, 161-166, G. R. Driver, *Journal of Bibl. Lit.* xiv 110 sqq., 323, and especially Baumgartner, "Das Aramäische im Buche Daniel," *Z. A. T. W.* [1927], 122 sqq.). The Hebrew of the book is also of a very late type, see Bevan, *Comm.*, 28-35. The presence of Greek words, especially the names of the musical instruments in iii 7, 10, 15, adds its significant contribution to the many-sided argument.

The book, then, is not a record of historical fact, but in its first half an edifying romance, and in its second half a typical apocalypse. The narrative portion is excellently suited to its purpose, and in the handling of the successive episodes the author's ability as a story teller is as evident as his religious fervour. Chapter v, in particular, is powerfully dramatic, a gem of the world's literature. The popularity of the stories is early attested by the existence of varying recensions. The old Greek version (as old as the middle of the 2nd century B.C.), now extant in a single ms., supported by the Syriac Hexaplaric version, differs very considerably from the standard text in chaps. iv-vi, and is here probably the rendering of a text which was reproduced from memory (Our standard Greek is the rendering of Theodotion, 2nd century A.D.). The influence of the second half of the book, the visions, was even more powerful and pervasive than that of the stories, determining to a considerable extent the course of the Jewish apocalyptic tradition, and affecting profoundly the early Christian scriptures. The visions are strongly patriotic in their immediate purpose, and there is abundant evidence that they gave in full measure the encouragement and the new religious impulse that they were designed to give. Very little attention is paid in them to the unseen world, their author does not concern himself with the secrets of the universe (contrast the book of Enoch). The eschatology of the book—immensely important as it is, and strongly emphasized by the author himself—is given the briefest possible space, vii 13 seq., 27, xii 1-3. That to which everything else is subordinated is the prediction of the immediate future. The Jews are soon to be delivered from their oppressors, and the faithful will triumph forever. In making his final and most vivid prophecy, the writer at length passes over from the known to the unknown in a very striking manner. In chap. xi, verses 3-39 present in the form of a prediction the detailed history of the Greek empire in the East, from the conquest of Alexander down to the latter part of the reign of Antiochus Epiphanes. Verses 40-45 continue this with an almost equally vivid description of events which had not yet taken place, but were only expected by the writer, namely, the wars which should result in the death of Antiochus and the fall of his kingdom. The mysterious symbolism employed in the computation of various intervals of time is another highly characteristic and significant feature of the Daniel visions. Thus, the "111 3, times, and a half" (xii 7) which must elapse before the end which has been foretold, the "weeks" (seven-year periods) of ix 24-27, and the enigmatic numbers of days in viii 14 and xii 11, sqq. For the interpretation of these ever fascinating riddles the reader is referred to the standard commentaries. The influence

of the book of Daniel on the Messianic hope of the Jews is still another fact of great importance. The "man" ("son of man") of vii 13 becomes henceforth a definitely Messianic title, as in the Book of Enoch and the Christian scriptures, on the other hand, the "anointed one" of ix 26 doubtless refers to the high priest Onias III, who was assassinated at Antioch c. 171 B.C. (II Macc iv 33-38), referred to in xi 22 as "the prince of the covenant."

The strange manner of occurrence of the two languages, first Hebrew, then Aramaic, then Hebrew again, the alternation not corresponding to any changes in subject matter or literary character, furnishes a riddle which many scholars have been content to abandon as insoluble. The view that the book, as we have it, is in its original linguistic form and the work of a single author (Behr, Kamphausen) certainly leaves the principal difficulties unexplained. It has been a favourite theory that the book was originally written in Hebrew, and that a portion of it was lost or destroyed in the Maccabean wars and afterward supplied from an Aramaic version (so Lenormant, Bevan, Prince). "This hypothesis stumbles on the fact that the Aramaic begins neatly at the appropriate point" (Montgomery, *Comm.*, p. 92). There are other significant features, mentioned above, for which it fails to account. A theory first proposed by the present writer and adopted by Montgomery, *Comm.*, recognizes two distinct halves of the book, an earlier and a later, and explains the alternation of languages as the work of the later writer, who himself devised this way of joining his own work to that of his predecessor. The original work, consisting of popular narratives written in Aramaic, comprised the first six chapters, vi 29 forming the natural conclusion. The author of the apocalyptic chapters, vii-xii, writing in the name of Daniel and with the purpose of supplementing the book already existing, composed his first vision, chap. viii, in Aramaic, wrote the remaining chapters, viii-xii, in Hebrew (the natural, almost essential, language of the older Jewish apocalypses), and replaced the original Aramaic of i 1-11 46 with his own rendering of it into Hebrew. An excellent place for making the transition was offered by ii 4, the verse in which the Chaldaean soothsayers first address the king. This ingenious proceeding made of the whole an indissoluble unit. Chap. 1 is indispensable to ii seq., while on the other hand vii seq. (Hebrew) could not possibly be separated from vii (Aramaic), for the successive revelations are manifestly all of one piece, and viii 1b significantly alludes to the preceding vision.

The date of the latter half of the book (and thus of the complete work) is given approximately by allusions to contemporary events. It was written in the time of Antiochus IV. Epiphanes, after the desecration of the temple (viii 11-14), which took place in Dec. 167 B.C. (for this date, and the others here given, see Kolbe's epoch making *Beiträge zur syrischen und jüdischen Geschichte*, Berlin, 1926). If, as some think, viii 14 implies that the writer had seen the rededication of the sanctuary (Dec. 164), while on the other hand the passage xi 40-45 shows, as all agree, that the death of Epiphanes (April 163) was still in the future, the visions are dated almost to the month.

The date of the first half of the book, the stories, is indicated with great probability by the allusions and the symbolism in chap. ii. The historical sketch terminates with the attempted alliance, through marriage, of the Ptolemæic and Seleucid kingdoms (so most commentators) at a time when the contrast between the two was like that between iron and clay. This would perfectly apply to the political conditions at the time when the crushing blow was inflicted on the northern kingdom by Ptolemy III. Euergetes in 246 B.C., immediately after the murder of Antiochus II, the Seleucid king, and his newly espoused wife, Berenice, the daughter of Ptolemy II. At no other time in the history of the two kingdoms was the contrast so strongly marked, the northern kingdom was not only impotent, it was actually crumbling. The provinces of the Euphrates and Tigris were now lost, Asia Minor was soon to follow, the two sons of Antiochus II were arrayed against each other. The most probable date for Daniel i-vi would seem to be between 246 and 240, the year of the peace concluded between Ptolemy III and Seleucus II. This dating satisfies all the conditions known to us nor is there any evident objection to it, if

the fact of composition is accepted. Those few who postulate for Ezekiel a date c. 230 obtain an interval sufficient to account for the allusions to Daniel (see above) and for the mention of Ezekiel by the Siracide.

BIBLIOGRAPHY—The commentaries of A. A. Ben (189), Behrman (1894), J. D. Prince (1899), Marti (1901) and especially Montgomerie (*International Critical Commentary* 1917), with full bibliography, Torrey, *Notes on the Aramaic Part of Daniel* (Trans. Conn. Acad. of Arts and Sciences xv, 1900, 241-282), supplemented in *Journal Am. Or. Soc.* xlii (1923), 279-284. In the above article use has been made of the article by J. D. Prince in the 11th edition of this encyclopedia, R. H. Charles, *A Critical and Exegetical Commentary on the Book of Daniel* (1929).

The "additions to Daniel" are three: *Susanna* and the *Elders, Bel and the Dragon*, and *The Song of the Three Children*. The two former have no organic connection with the book of Daniel, the last is inserted between verses 23 and 24 of chap. iii.

Susanna—This addition was placed by Theodotion before chap. i, and *Bel and the Dragon* at the close, whereas by the Septuagint and the Vulgate it was reckoned as chap. xii after the twelve canonical chapters, *Bel and the Dragon* as xiv. Theodotion's version is the source of the Peshito and the Vulgate, for all three additions, and the Septuagint is the source of the Syro Hexapla, which was published by Ceram (*Mon. Sac. vi*). The legend recounts how that in the early days of the Captivity Susanna, the beautiful and pious wife of the rich Joakim, was walking in her garden and was there seen by two elders who were also judges. Inflamed with lust, they made infamous proposals to her, and when repulsed they brought against her a false charge of adultery. When brought before the tribunal she was condemned to death and was on the way to execution, when Daniel interposed and, by cross-questioning the accusers apart, convinced the people of the falsity of the charge.

The most interesting part of the story is the latter half, which deals with the trial. It has been plausibly conjectured that the characteristic features of this section point to its composition about 100-90 B.C., when Simon ben Shetah was president of the Sanhedrin, and when the Pharisees were attempting to bring about a reform in the administration of the law courts. See Ball in the *Speaker's Apocrypha*, ii, 329 f.

The language was Semitic. The original of Theodotion's Greek seems to have been Hebrew, notice especially the idiom (not Aramaic) in vs 15. In the "Septuagint" version the evidence is not so clear, certain features seem rather to point to Aramaic. See further Ball in the *Speaker's Apocrypha*, Rothstein in *Kautsch's Apocryphen*, D. M. Kay in *Charles' Apocrypha*.

Bel and the Dragon—We have here two independent narratives, in both of which Daniel appears as the destroyer of heathenism. It is possible, as the comms have remarked, that some details of the story of the dragon were suggested by the Babylonian mythology. The legend of Habakkuk, who brings food to Daniel in the lions' den, is an interesting feature. The Greek exists in two recensions, those of the "Septuagint" and Theodotion. The original language, which was certainly Semitic, seems to have been Hebrew, though this has not been demonstrated conclusively. See Ball and Rothstein (as above), Witton Davies in *Charles' Apocrypha*.

Song of the Three Children—This section is composed of the Prayer of Azariah and the Song of Hanannah, Azariah and Mishael, and was inserted after vs 23 of the canonical text of Daniel. The original language of both prayer and hymn was certainly Hebrew, and the insertion was made in the Aramaic text. Careful comparison with the Greek versions shows that our canonical text has the original form of verses 21-25. See Ball and Rothstein (as above), Bennett in *Charles' Apocrypha*.

(R. H. CH., C. C. T.)

DANIEL (DANIEL), of Kiev, the earliest Russian travel writer, and one of the leading Russian travellers in the middle ages. He journeyed to Syria and other parts of the Levant about 1166-67. He was the *igumen*, or abbot, of a monastery probably near Chernigov in Little Russia. He visited Palestine in the reign of Baldwin I., Latin King of Jerusalem (1100-18), and apparently soon after the crusading capture of Acre (1104), he claims to

have accompanied Baldwin who treated him with marked friendliness on an expedition against Damascus (c. 1107). Though Daniel's narrative beginning at Constantinople omits some of the most interesting sections of his journey, his work has considerable value. His picture of the Holy Land preserves a record of conditions (such as the Siracens ruling almost up to the walls of Christian Jerusalem, and the friendly relations subsisting between Roman and Eastern Churches in Syria) peculiarly characteristic of the time, his three excursions—to the Dead Sea and Lower Jordan, to Bethlehem and Hebron, and towards Damascus—gave him an exceptional knowledge of certain regions. In spite of blunders in topography and history, his observant and detailed record is among the most valuable of mediæval documents relating to Palestine. It is also important in the history of Russian language, and in the study of ritual and liturgy. Several Russian friends and companions, from Kiev and an old Novgorod, are recorded by Daniel as present with him at the Easter Eve "Miracle" in the church of the Holy Sepulchre.

There are 76 mss. of Daniel's Narrative, of which only five are anterior to A.D. 1500, the oldest is of 1475 (Leningrad, Library of Ecclesiastical History, 9/1086). Three editions exist of which I. P. Sakharov's (1849) is perhaps the best known (in *Narratives of the Russian People* vol. ii, bk. viii, pp. 2-15). See also the French version in *Itinéraires russes en orient*, ed. M. B. de Khotkov (Geneva, 1888) (*Société de l'orient latin*), and the account of Daniel in C. R. Beazley, *Dawn of Modern Geography* (1897) etc. ii, 155-174.

DANIEL, ARNAULT (fl. late 12th century), French troubadour, was born at Ribeyrac in Perigord and became a member of the court of Richard, the lion-hearted. He has become famous through the praise of Dante who ranks him with the Lustful in the seventh circle of purgatory. Arnault's amatory poems, though often obscure, are technical in mistakes of versification.

See E. Camello, *La Vita e le opere del trovatore Arnaldo Daniel* (Halle, 1883) and *Les Poésies d'Arnaut Daniel, Réédition critique d'après Camello* (Toulouse, 1910).

DANIEL, GABRIEL (1649-1728), French Jesuit historian, was born at Rouen on Feb. 8, 1649. He entered the Jesuit order at the age of 18, and became superior at Paris. He is best known by his *Histoire de France depuis l'établissement de la monarchie française* (first complete edition, 1713). Daniel published an abridgment in 1724 (Eng. trans., 1726), and another abridgment was published by Dorville in 1751. Daniel also wrote a *Histoire de la milice française*, etc. (1721) and a reply to Pascal's *Provincial Letters*, entitled *Entretiens de Clément et d'Eudoxe sur les lettres provinciales* (1694), two treatises on the Cartesian theory as to the intelligence of lower animals, and other works.

See Sommervogel, *Bibliothèque de la Compagnie de Jésus*, t. ii.

DANIEL, SAMUEL (1562-1619), English poet and historian, was born near Taunton in 1562, and died at Beckington, near Devizes, on Oct. 14, 1619. His brother, John Daniel, was a musician and the author of *Songs for the Lute, Viol and Voice* (1606). In 1579 Samuel was admitted a commoner of Magdalen hall, Oxford, where he remained for about three years. He was first encouraged and, he says, taught in verse, by Sir Philip Sidney's sister, Mary, countess of Pembroke, whose household he had entered as tutor to her son, William Herbert. His first known volume of verse is dated 1595, it contains the cycle of sonnets to *Deha* and the romance called *The Complaint of Rosamond*. Twenty-seven of the sonnets had already been printed at the end of Sir Philip Sidney's *Astrophel and Stella* without the author's consent. Several editions of *Deha* appeared in 1592, and they were very frequently reprinted during Daniel's lifetime. *The First Four Books of the Civil Wars*, an historical poem in *ottava rima*, appeared in 1595. *Poetical Essays* apparently first printed in 1599, contained, besides the "Civil Wars," "Musophilus" and "A letter from Octavia to Marcus Antonius," poems in Dan's finest and most mature manner. About this time he became tutor to Anne Clifford, daughter of the countess of Cumberland. On the death of Spenser, in the same year, Daniel received the title of poet laureate, which he seems, however, to have shortly resigned in favour of Ben Jonson. About this time, and at the recommendation of his brother-in-law, Giovanni Florio, he was taken into

favour at court, and wrote a *Panegyric Congratulatory offered to the King at Burleigh Harrington in Rutlandshire, in ottava rima*. In 1603 this poem was published, and in many cases copies continued in addition his *Poetical Epistles* to his patrons and a prose essay called *A Defence of Rime* (originally printed in 1602) in answer to Thomas Campion's *Observations on the Art of English Poetrie*, in which it was contended that rhyme was unsuited to the genius of the English language. Daniel's essay and Campion's were published together, *Bodley Head Quartos*, No. 14 (New York, 1925). In 1603 Daniel was appointed master of the queen's revels. In this capacity he brought out a series of masques and pastoral tragicomedies, of which were printed *A Vision of the Twelve Goddesses*, in 1604, *The Queen's Arcadia*, an adaptation of Guarini's *Pastor Fido*, in 1606, *Tethys Festival or the Queen's Wake*, written on the occasion of Prince Henry's becoming a knight of the bath, in 1610, and *Hymen's Triumph*, in honour of Lord Roxburgh's marriage in 1615. Meanwhile had appeared, in 1605, *Certain Small Poems*, with the tragedy of *Philotas*, which brought its author into difficulties, as *Philotas*, with whom he expressed some sympathy, was taken to represent Essex. In 1607, under the title of *Certain small Works heretofore divided by Samuel Daniel*, the poet issued a revised version of all his works except *Dulca* and the *Civil Wars*. In 1609 the *Civil Wars* had been completed in eight books. In 1612 Daniel published a prose *History of England*, from the earliest times down to the end of the reign of Edward III.

Daniel was made a gentleman extraordinary and groom of the chamber to Queen Anne, and was now acknowledged as one of the first writers of the time. Later in life he threw up his titular posts at court and retired to a farm called "The Ridge," which he rented at Beckington, near Devizes, in Wiltshire, where he died.

Of Daniel's works, the sonnets are now, perhaps, most read. They depart from the Italian sonnet form in closing with a couplet, as is the case with most of the sonnets of Surrey and Wyatt, but they have a grace and tenderness all their own. Of a higher order is *The Complaint of Rosamond*, a soliloquy in which the ghost of the murdered woman appears and bewails her fate in stanzas of exquisite pathos. Among the *Epistles to Distinguished Persons* will be found some of Daniel's best work. The epistle to Lucy, countess of Bedford, is remarkable among those as being composed in genuine *terza rima*, till then not used in English. *Hymen's Triumph* is perhaps the best of all his dramatic writings. An extract from this masque is given in *Lamb's Dramatic Poets*, and it was highly praised by Coleridge. In elegant verse he always excelled, but most of all in his touching address to *The Angel Spirit of the Most Excellent Sir Philip Sidney*. *Musophilus* is one of the most characteristic writings of Daniel. It is a dialogue between a courtier and a man of letters, and is a general defence of learning, and in particular of poetic learning as an instrument in the education of the perfect courtier or man of action. It is addressed to Fulke Greville, and written in a sort of *terza rima*, or, more properly, *ottava rima* with the couplet omitted. Daniel is wanting in fire and passion, but he is pre-eminent in scholarly grace and tender, mournful reverie.

Daniel's works were edited by A. B. Grosart in 1885-96, *Selected Verse* (Pembroke Booklets, No. 6, 1905).

DANIELL, the name of a number of English late 18th and early 19th century artists. THOMAS D. (1749-1840) was best known for his collaboration with his nephew William on *Oriental Scenery*, drawn in India in 1784-93 and published in six aquatinted volumes in 1808. WILLIAM D. (1769-1837) was also noted for his Madras panoramas, for his aquatinted *Picturesque Voyage to India* (1810) and for *A Voyage Round Great Britain* (4 vol., 1814-25). He made soft ground etchings (1808-14) of G. Dance's portraits of John Flaxman, Benjamin West, etc. Thomas and William were both under the general influence of Paul Sandby. William's brother SAMUEL D. (1775-1811) travelled into Berchuanaland in 1801, one result being his aquatinted *African Scenery and Animals* (2 parts, 1804-05). Settling in Ceylon in 1806 he published in 1808 *Picturesque Illustrations of Ceylon*. (See *Dictionary of National Biography*, London, 1888.)

Of Daniells unrelated to the above the most notable was the

Rev EDWARD THOMAS D. (1804-43), a Norwich amateur landscape etcher, dry point engraver and water colourist. He was early taught by J. Crome and J. S. Cotman and was later a friend of J. M. W. Turner. (See J. Laver, *Hist. Brit. and American Etching*, London, 1929.) Others included ABRAHAM D. (d. 1803), miniaturist of Bath, J. D. (fl. c. 1800), London miniaturist, JAMES D. (fl. c. 1800) etcher, and JOSEPH D. (fl. c. 1810), etcher.

DANIELL, JOHN FREDERIC (1790-1845), English chemist and physicist, was born in London on March 17, 1790, and in 1831 became the first professor of chemistry at the newly founded King's College, London. His name is best known for his invention of the Daniell cell (*Phil. Trans.*, 1836, see BATTERY), still extensively used for telegraphic and other purposes. He also invented the dew point hygrometer known by his name (*Quar. Journ. Sci.*, 1830) and a register pyrometer (*Phil. Trans.*, 1830), and in 1830 he erected in the hall of the Royal Society a water barometer with which he carried out a large number of observations (*Phil. Trans.*, 1832). A process devised by him for the manufacture of illuminating gas from turpentine and resin was in use in New York for a time. His publications include *Meteorological Essays* (1833), an *Essay on Artificial Climate considered in its Applications to Horticulture* (1824), which showed the necessity of a humid atmosphere in hothouses devoted to tropical plants, and an *Introduction to the Study of Chemical Philosophy* (1839). He died suddenly on March 13, 1845, in London while attending a meeting of the council of the Royal Society, of which he became a fellow in 1813 and foreign secretary in 1839.

DANIELS, JOSEPHUS (1862-1948), U.S. publisher and politician, was born at Washington, N.C., on May 18, 1862, and educated briefly at the University of North Carolina at Chapel Hill. Publisher, and intermittently editor, of the *Raleigh State Chronicle* from 1885 to 1904 and the *Raleigh News and Observer* from 1904 to 1948, he was a leader of movements for railroad regulation and prohibition. A supporter of William J. Bryan from 1896 to 1910, he turned in 1911 to Woodrow Wilson for leadership of the Democratic party and helped nominate Wilson for the presidency in 1912. Appointed secretary of the navy in 1913 by President Wilson, Daniels attempted to democratize the naval service, fought against the armour plate monopoly and helped bring the navy to peak size and efficiency during World War I. He was appointed ambassador to Mexico by Pres. Franklin D. Roosevelt in 1933 and won Mexican friendship and helped prevent Mexican expropriation of U.S. oil properties from disrupting Mexican-US relations. His five volume autobiography (*Tar Heel Editor*, 1939, *Editor in Politics*, 1941, *The Wilson Era*, *Years of Peace*, 1944, *The Wilson Era*, *Years of War and After*, 1946, and *Short Sleeve Diplomat*, 1947) is a major contribution to American historical literature. He died on Jan. 15, 1948, at Raleigh, N.C. (A.S.L.A.)

DANISH LANGUAGE Danish is a Germanic language, closely related to Swedish, Norwegian and Icelandic, which are all derived from a common Scandinavian language, the separation of the four languages began at about A.D. 1000. The primeval Nordic language (c. A.D. 250-800) is known from relatively few runic inscriptions, among which is the famous Danish *Gold Horn Inscription* (c. 400). In the period of so called runic Danish (800-1100) remarkable changes took place, mainly through fracture, mutation, *i*-mutation and assimilation, and through the disappearance of unstressed short vowels. While these and other phenomena apply to all the Scandinavian languages, other changes, such as the monophthongization of *eo* into *e*, *au* into *ø*, and *ey* into *ø*, and the disappearance of *h* in front of *k*, *n* and *r*, are characteristic only of the east Scandinavian languages (Swedish and Danish). The period of Middle Danish (1100-1500) is characterized by a weakening of the vowels *a* and *i* into *e*, in an unstressed position and by a change of the plosives *p*, *t* and *k* into *b*, *d* and *g*, after a vowel sound. Other characteristic changes are from *ja* into *yø*, from *ju* into *yy*, from a long *a* into the *a*-sound and from the unvoiced *th* sound (written *þ*) into *t*. A general simplification of declension and grammar took place at the same time, more slowly in the eastern Danish provinces of Scania, Halland and Blekinge most radically in the western dialects of Jutland.

Already in the viking period a number of loan words of Latin

and Greek origin penetrated into the Danish language, this tendency was continued in the middle ages, when there was also a great influx of Low German words preverbs and suffixes, because of the influence of Hanseatic merchants.

Modern Danish may be divided into two periods, before and after 1700. While the general simplification of the language continued steadily many new words came into the language, mainly from High German and French but also from a variety of other languages. Several of these loan words disappeared again, to some extent the result of the deliberate efforts of language purists, but many came to stay. An influx of English loan words is noticeable from about 1870.

A characteristic phenomenon of the modern spoken language is the glottal stop (*Stød*), derived from an original nasal accent.

The grammatical structure of modern Danish is nearly as simplified as that of modern English, as in English there are only two cases (nominative and genitive), but there are two genders (common gender and neuter). In addition to the letters of the English alphabet, Danish has the three letters *æ*, *ø* and *å*. A spelling reform of 1948 abolished the previous general use of capital letters for nouns and replaced the letter *aa* by *a*.

DANISH LITERATURE Denmark's first literature is found in the runic inscriptions scratched on stone or carved on metal, mainly epitaphs of warriors, kings and priests, occasionally with short, unrhymed alliterative verses reflecting the viking spirit. Runic inscriptions were used in Denmark from about A.D. 250, but most of those preserved date from 800–1100.

Middle Ages—With the introduction of Christianity Latin became the predominant language. Andreas Suneson (1160–1228) wrote *Hevæmeron*, a long Latin poem describing the creation and the ecclesiastical dogmas. This poem, the poetry of Morten Borup (c. 1446–1526), and two poems of mourning and despair of unknown origin are Denmark's most important contributions to mediaeval Latin poetry. A number of legends and biographies of saints date from the early middle ages, notably one about Canute the Holy, by Ælnoth, an English monk, various annals of monasteries, as well as historical chronicles, have also survived. Svend Aggesen's brief outline of Danish history before 1185, *Historia Regum Danie Compendiosa*, was shortly to be followed by the *Gesta Danorum* by Saxo Grammaticus, Denmark's first important contribution to world literature. Of its 16 books, written between 1185 and 1222, the first 9 cover prehistoric Danish antiquity, based on pagan legends and heroic poems passed down by word of mouth from generation to generation.

Danish mediaeval literature also includes a number of edifying books, hymns and various provincial laws, the "Law of Scania," two "Zealandish Laws," and the "Law of Jutland," the latter being accepted by the rulers of the kingdom in 1247. Other important treasures are Peder Laale's *Proverbs* (14th century), some medical books by Henck Harpestreng (13th century), *Luodarius*, a mediaeval "encyclopaedia," and *Rimkrønike*, a versified Danish history, incidentally the first Danish book to be printed (1495).

In a class by themselves are the Danish mediaeval ballads, of which 539 are known in more than 3,000 versions, but nearly all were written down after the end of the middle ages. No country possesses a finer treasure of mediaeval ballads than Denmark. The first printed edition appeared in 1591.

The Reformation and the Renaissance—In 1536 the Reformation came to Denmark, and this marked the end of the middle ages. The beginning of the 16th century was characterized by its many religious polemic pamphlets, for or against the Roman Catholic Church. This inaugurated a new literature in the mother tongue. European humanism and the Renaissance made their influence felt also in Denmark, where Christiern Pedersen (d. 1554) ranks as the most prominent among the humanists who supported the Reformation. He edited the first printed edition of Saxo's *Gesta Danorum* (in Paris, 1514) and Laale's *Proverbs*, translated

the New Testament and adapted Martin Luther's pamphlets into Danish. Of supreme importance is his participation in the translation of the Bible (1550). Poul Helgesen (c. 1485–c. 1535) was the most gifted opponent of the Lutheran reformation (also the author of the *Shaky Chronicle*) and Hans Tausen (1494–1561) its most talented spokesman. The *Visitation Book* of the Lutheran bishop Peder Palladius (1550–60) is a charming literary document.

The bulk of 16th-century Danish poetry was either religious or polemical, the main lyrical contributions being some fine love poetry and some hymns. Hans Thomssøn's collection of hymns (1569) was the first one of importance, Hans Christensen Sthen (1544–1610) the first notable hymnist known.

The earliest plays—mysteries, miracles, moralities, farces and school plays—date from the beginning of the 16th century, but many of them have been lost. *Ludus de Sancto Canuto*, a miracle play, dates from c. 1530. The most important playwright of the period was Hieronymus Justesen Ranch (1539–1607) and the farce *Karrig Nidding* his best play.

Anders Sørensen Vedel (1547–1616) translated Saxo's work into Danish and edited the first collection of ballads, Peder Clausen Fris (1545–1614), a Norwegian, translated Snorri's *Hams Krønike*, and Arild Huitfeldt (1546–1609) wrote *Danmarks Rigis Krønike* in ten volumes. In the field of astronomy Tycho Brahe (1546–1601) acquired European fame.

In the 17th century literary renaissance reached Denmark, which led to a strict adherence to classical patterns. It was an age of orthodoxy and blind belief in authority, whether in political, religious or literary matters. Niels Hemmingsen (1513–1600), a theologian of European reputation, had fallen a victim to the heresy hunt in the previous century, and in religious literature Latin dogmatics, edifying leaflets and a host of pamphlets reflecting the superstitions of the century were dominant.

It was, however, a great era of science and scholarship. Caspar Bartholin (1585–1629) and his son, Thomas Bartholin (1616–80), were famous anatomists whose works were known far outside the boundaries of Denmark. Niels Steensen—or Nicolaus Steno—(1638–86) was a renowned anatomist and geologist, Ole Rømer (1644–1710) a physicist, Simon Pauli (1603–80) a botanist and anatomist, and Ole Worm (1588–1654) an antiquarian, famous for his book on the runic inscriptions, the *Monumenta Danica* (1643). Thormod Torfæus (1636–1719) and Arni Magnusson (1663–1730) introduced the scholarly study of Old Norse literature, and Peder Hansen Resen (1625–88), who wrote a description of Denmark, *Danske Atlas*, edited and translated some of the poetry of the *Edda*, Erik Pontoppidan (1616–78), with his *Grammatica Danica* (1650), and Peder Syv (1631–1702), with his *Betænkninger om det cimbriske Sprog* (1663) and his *Danske Sprog-Kunst* (1685), introduced the linguistic study of the Danish language.

The most important Danish prose work of the 17th century is *Jenners Munde*, the memoirs of Leonora Christina (1621–98), the daughter of Christian IV, a fascinating human document about her 20 years' imprisonment in the Blue Tower of Copenhagen. The manuscript was first discovered and published in 1869.

Danish poetry in the 17th century tended to follow the classics slavishly, and the favourite forms were the hexameter, the Alexandrine and the sonnet. Simplicity is deliberately avoided, the style is precious, allegories, euphemisms and metaphors abound. Anders Arrebo (1587–1637) translated the Psalms and wrote a free Danish adaptation of Du Bartas' *Hexaemeron* (1661). The century was rich in occasional poetry celebrating weddings and birthdays, or mourning for a deceased paragon of virtue, didactic and pastoral poems were also frequent. Anders Bording (1619–77), an interesting exponent of Danish baroque poetry, was also the founder of the first Danish newspaper, *Danske Mercurius* (from 1666), in which the news appeared in rhymed Alexandrines. The only truly great poet was Thomas Kingo (1634–1703), a supreme master in almost every field of poetry. His hymns reflect a violent, passionate character, worldly and deeply religious at the same time. Among the few playwrights Mogens Skæel (1650–94) deserves mention.

The 18th Century—Ludvig Holberg (*q.v.*, 1684–1754) is the great name of Danish literature in the first half of the 18th century. His most important contribution is his 32 comedies written for the Danish theatre, which opened in 1722. His first 15 plays are comedies of character, 11 plays (written 1723–27) are comedies of manner, and a final group, mainly written in his old age, are moral allegories. His aim was to create a modern Danish literature on European lines and to entertain by making people laugh at their own follies. He wrote also satires *e.g.*, *Peder Paars* (1719–20) a mock-heroic poem, and *Niels Klim's Subterranean Travels* (in Latin, 1741). His *Moraliske Tanker* (1744) and his nearly 500 *Epistler* (1748–54) are the finest examples of a Danish *Spectator* literature. He also contributed a number of valuable historical works. Influenced by English and (mainly) French thinking, he was a sober rationalist, led by reason in all matters, who always preferred to follow a middle course.

Among Holberg's contemporaries the greatest lyrical poets are H. A. Brorson (1694–1764), a religious mysticist whose Pietist hymns have often a background of personal sorrow or agony, and Ambrosius Stubb (1705–58), whose poems are mainly religious and moralizing arias or occasional pieces, witty improvised epigrams or drinking songs. The satirist Christian Falster (1690–1752) was a conservative counterpart to Holberg, Frederik Eilschow (1725–50) and Jens Scheiderup Sneedorf (1724–64), the latter of whom edited *Den patriotiske Tidskræft*, a Danish *Spectator*, were both rationalist disciples of Holberg. Notable historians were Hans Gram (1685–1748), Jacob Langebek (1710–75) and Erik Pontoppidan the Younger (1698–1764). Alexander Pope, Edward Young and James Thomson influenced the didactic and descriptive poetry of C. B. Tullin (1728–65).

A significant revival of Danish literature took place toward the end of the century. Johan Herman Wessel (1742–85), one of Denmark's greatest humorists, immortalized his name when, in 1772, he wrote *Kærlighed uden Strømper* (*Love Without Stockings*), a parody directed against the Danish imitations of Italian operas and French tragedies that had superseded Holberg's comedies on the Danish stage, especially those of Niels Krog Bredal (1733–78) and Johan Nordal Brun (1745–1816). His light humorous poems and versified narratives are still very popular.

At the same time a revival of emotional poetry was taking place, influenced partly by German literature (Goethe, Schiller and Klopstock), partly by English literature (Shakespeare, Milton, Macpherson, Percy, Young and Gray). Johannes Ewald (*q.v.*, 1743–81), by many regarded as Denmark's greatest lyrical poet, was the first poet to delve into Scandinavian antiquity and discover the poetic wealth in the myths, in Saxo, in the sagas, and in the ballads. *Rolf Krage* (1770) and *Balders Død* (1773) are his best tragedies, *Fiskerne* (*The Fishermen*, 1780) was the first serious Danish drama in which ordinary people were treated heroically. His lyrical poetry vanes from the solemn and majestic to the simple and subdued expression of feelings. His memoirs, *Levnede og Mønstre* (*Life and Opinions*), were influenced by Laurence Sterne and Jean Jacques Rousseau. Jens Baggesen (*q.v.*, 1764–1826) first imitated the satires of Holberg and Wessel but gradually developed a style of his own. He is a poet of distinction, although the quality of his poetry varies much. In *Labyrinten* (1792–93), a charming arabesque, impressionistic in style, he described his travels in Europe in the manner of Sterne.

The 19th century saw a further development of Danish literature. The romantic period it will suffice to mention the charming comedy *Guldalumsboks* (*The Gold Box*) by Christian Olufsen (1764–1827), the idyllic

and patriotic plays of Thomas Thaarup (1749–1821), and the historical tragedy *Dyveke* by Ole Samsee (1759–96). Among the several historical and critical writers of this period special mention should be made of Rasmus Nyerup (1759–1819), a scholarly philologist, and Werner Abrahamsen (1744–1812), aesthete and critic. The popular historical essays entitled *Store og gode Handlinger* (1777) by Ove Malling (1747–1829) exercised a great influence, as did the historical works of P. I. Suhm (1728–98).

The Romantic Period—The Romantic movement came to Denmark from Germany, inspired partly by the German *Jena* Romantics, partly by the classicism of Goethe and Schiller. F. W. Schelling's philosophy was interpreted in Denmark by the Norwegian Henrik Steffens (*q.v.*, 1773–1845), but the leading Danish Romantics gave it a form very different from the original. A. W. Schack von Staffeldt (1769–1826) was hardly recognized in his lifetime, and his metaphysical poetry lacked popular appeal.

Adam Øhlenschläger (*q.v.*, 1779–1850) became the leader of the movement in Denmark and his versatile writings, especially between 1802 and 1807, were inspired by a youthful ecstasy. In poetry, drama and prose he gave evidence of poetic genius which has no parallel in Danish literature. *St. Hans Aftenspel* and *Alad du* are among his most important early plays, both embodying the main ideas of Danish Romanticism. *Hakon Jarl* is the best among his many northern tragedies, and among later works his cycle of dramatic poems entitled *Hulge* (1814) is outstanding. N. F. S. Grundtvig (*q.v.*, 1783–1872) is a gigantic figure, not only in Danish literature, but also as an educationalist, a historian, a philological scholar and a politician. His popular and historical songs, his many hymns and his personal poetry gave him a lasting place in literature. He shared the Romantic enthusiasm for the antiquities of Scandinavia, interpreting the Scandinavian myths as poetic visions, he retranslated both Saxo and Snorri and translated *Beowulf* into Danish before it had even appeared in English. His *Handbook of World History* is, like his other historical works, a strange mixture of scholarship, prophetic visions and insanity. B. S. Ingemann (*q.v.*, 1780–1862) inspired contemporary thought with the Romantic ideas of chivalry and national pride through his historical novels (1824–36) and through his poetic cycle about *Holger Danske*. Of more lasting value, however, are his simple and unsophisticated *Morning and Evening Songs*. Carsten Huch (*q.v.*, 1790–1872) wrote dramas which are often sinister, tragic and philosophic frequently in a historical setting, his historical novels reflect his philosophy of resignation. He ranks highest as a contemplative lyrical poet.

Romantic Realism—During the first quarter of the 19th century the early Romantic movement was unchallenged. Then appeared two men who brought a new element of reason and realism in Danish literature. Poul Møller (1794–1838) was the author of the first novel in Danish dealing with contemporary events, *En dansk Students Eventyr* (1824), a charming book, full of gay humour. Some of his poems are in the form of dramatic scenes, others in the form of fables, often reflecting personal disillusionment. His brilliant aphorisms also deserve mention. Steen Steensen Blicher (1782–1848), an impoverished Jutland parson, was in his early life strongly influenced by Ossian, he translated Ossian, Pope, Goldsmith and some of Percy's ballads. In *Tidels-fuglene* (*Birds of Passage*, 1838) he interprets human nature with sad resignation, some of his best poems are in the Jutland dialect. His many *noveller* (short stories), beginning in 1824 with the masterly *En Lundsbydegn's Dagbog* (*The Journal of a Parish Clerk*), strike notes varying from sorrow and resignation to humour and irony.

Minor writers of the same period are Thomasine Gyldenbourg Ehrensverd (*q.v.*, 1773–1856), whose *Hverdagshistorier* were much admired, Carl Bernhard (1798–1865), who wrote novels under the nom de plume of A. de Saint Aubain, and Carl Bagger (1807–46) whose novel *Min Broders Levned* shocked the literary world by its bold realism.

Poetic Realism—About 1830 the early Romantics turned to a poetic realism, less naive, more contemplative and concerned with form than with content. The leader of

ment, Johan Ludvig Heiberg (q.v., 1793-1860) was it; his zenith the dictator of literary taste in Copenhagen. As a dramatist he attempted to revivify Danish drama by importing French vaudeville and in his serious comic plays (e.g. *Lærkesang* and *Syngesange*), there is an interplay between the worlds of poetic and pedestrian reality. His highest achievement is the comedy *En syal eller Døden* (*I Said After Death*, 1841). He was a literary critic of high distinction strongly influenced by the philosophy of Hegel. After his death his wife Johanne Louise Heiberg (1812-90), published her fine *Memoirs*. Henrik Hertz (q.v., 1797-1870) also regarded perfection of form as more important than content, as clearly expressed in his *Letters of a Ghost* (1850). As a poet he was a clever imitator of style, as a playwright he contributed both light comedies and serious romantic plays (e.g. *Svend Dyrings Hus*).

A revival of lyrical poetry took place in the 1830s and 1840s, led by Christian Winther (q.v., 1796-1876), Ludvig Adolf Bødtker (1793-1874) and Emil Aarestrup (1800-56). They are mainly concerned with love and nature, treated in a purely aesthetic manner. Winther was a Zealand poet, who sung the praises of his native island and of woman. His long verse novel *Hortens Flugt* (*The Flight of the Stag*, 1835) is his main work. Bødtker wrote only a handful of poems, several of which are inspired by the Italian scene; his poetry is delicate, sensitive and artistically sober. Aarestrup Galleic in his taste was an epicurean, a lover and connoisseur of beauty, he is Denmark's erotic poet par excellence. Frederik Paludt Müller (q.v., 1809-76), originally a light and frivolous disciple of Byron, became eventually an uncompromising moralist condemning the world and the flesh. His main work, *Adam Homo* (1841-48), a poetic epic in 12 cantos, is a bitter contemporary satire. The subjects of his poems are often mythological or biblical.

Hans Christin Andersen (q.v., 1805-75) wrote novels (e.g. *The Improvisatore*), poems, plays and a number of travel sketches, but of lasting value are only his *Fairy Tales and Stories*, 164 in all, the first four published in 1835. Some are based on Danish folk tales, some on historical incidents, the plots of others are from foreign sources, but most of them are his own invention, often springing from some personal event. They were told for children, but their ideas are often better understood by the grownups. His own story is told in *Min Livs Eventyr* (1855).

Søren Aaby Kierkegaard (q.v., 1813-55) holds an entirely isolated position in Danish literature, unattached to any group of writers and with hardly any followers in his lifetime. His religious philosophy is expressed in such works as *Either/Or* (1843) and *Stages on Life's Way* (1845). He spent his last years in a violent and passionate attack on "official Christianity."

M. A. Goldschmidt (1819-87), a Danish Jew, was the editor of a rebellious, anti-racist weekly, *Conserven*, 1840-46. Many of his novels are concerned with Jewish life in the Danish community (e.g. *A Jew*, 1845). The 1850s and 1860s produced hardly any new Danish writers of importance. The poetry of Carl Ploug (1813-94) has little inspiration, and the Grundtvigian songs and light comedies of Jens Christian Hostrup (1818-92) have more popular than literary value. Christian Richardt (1831-92) and H. V. Kaalund (1818-83) did little more than relish the better-known Romantic themes. Edvard Lembecke (1815-97) should be mentioned for his translations of Shakespeare and Byron. The novels of Wilhelm Bergsøe (1835-1911), e.g. *Fra Piazza del Popolo* (1866), Carl Brorhoff (1816-1900), who wrote under the nom de plume of Carl Eldar, and H. F. Ewald (1821-1908) are mainly entertaining. The most original novelist of the period was Hans Egede Schack (1820-59), whose novel *Phantasterne* (1857) reveals great psychological gifts. Philosophers of some distinction are Frederik Christian Sibbern (1785-1872), Rasmus Nielsen (1806-84) and Huns Brøchner (1820-75).

Radical Realism—*Det moderne gennembrud* is the Danish term used to describe the new movement beginning about 1870 in which a modern (i.e., naturalistic or realistic) literature emerged—a movement of which Georg Brandes (q.v., 1842-1927) was the spiritual leader. Originally influenced by H. A. Laune, C. A. Sainte Beuve and J. Stuart Mill he felt it his mission as a critic to awaken the Danes and bring Denmark out of her backwater and

isolation. His *Main Currents in 19th Century Literature* (1871-87) caused a great sensation, and his demands that literature should concern itself with life and reality not with dreams and fantasy and that it should work in the service of progress, not in the service of reaction, provoked much discussion. Among his many critical and scholarly books his various biographies of great men (e.g., Shakespeare, Goethe, Voltaire) should be mentioned, these were to some extent written under the influence of I. W. Nietzsche whose "aristocratic radicalism" he came to share. His influence was not limited to Denmark; both Henrik Ibsen and August Strindberg were influenced by him. J. P. Jacobsen (q.v., 1847-83) was among the first Danish writers to be influenced by Brandes, especially his novel *Niels Lyhne* and his short stories deal with the problem of dreams versus reality. In *Marie Grubbe* he introduced the naturalism of Gustave Flaubert. Holger Drachmann (q.v., 1846-1908), the greatest lyrical poet of the period, began his career as a staunch supporter of Brandes, against whom he reacted strongly later on. He holds a high place as a lyric poet, passionate, impulsive and capricious. He is the author of many fine love poems, much of his poetry and prose is concerned with the sea and with the lives of sailors and fishermen. The novels and peasant stories of Sophus Schandorff (1836-1901) show prose realism of less artistic value. Vilhelm Tøpssø (1840-87) depicted contemporary life with subtle irony in his prose works. Edvard Brandes (1847-1931) discussed contemporary problems in his plays.

Henrik Pontoppidan (1857-1943) holds rank as one of Denmark's greatest novelists. His early stories reveal social injustices, and in several of his short novels he discusses the political, moral and religious problems of his day. But his greatest contribution is his three long novel cycles, *Det Forjættede Land* (1891-95), *Lykke Øen* (1898-1904) and *De dødes Rige* (1912-16). They are all concerned with contemporary Denmark and are most penetrating and convincing, though little flattering, analyses of Danish national character. Herman Bang (1857-1912) is another novelist who cultivated the small things, insignificant people, the gray and lonely and miserable men and women who are normally overlooked because nothing ever seems to happen in their underdog lives. In his best novels, e.g. *Ved Vejen* (1886), *Tine* (1889) and *Det brude Hus* (1898) he displays the virtuosity of his impressionistic technique. Carl Gjellerup (1857-1919) began as a disciple of Brandes, whom he later opposed. *There is a fine poetic beauty in his best novels, e.g. Minna and Møllen*, but the metaphysical idealism of his later novels have made them unreadable.

Other notable prose writers toward the end of the century were Gustav Wied (1858-1914), a novelist and playwright, whose wit is cynical and bitter, his "satyr-plays" and his novels (e.g. *Livsens Ordskol* and *Knagsted*) are full of malicious humour, Peter Nansen (1861-1918), whose stories are in the style of Maupassant, Carl Ewald (1856-1908), whose nature stories are based on Darwinian philosophy, Otto Benzon (1856-1927) and Gustav Esmann (1860-1904), playwrights, and Carl Larsen (1860-1931), who caught the atmosphere of Copenhagen and drew a picture of Danish "cockneys" with fine linguistic precision. Sven Lange (1868-1930), Einar Christiansen (1861-1939) and Henri Nathansen (1869-1944) are three notable playwrights.

Poetic Revival.—In the 1890s a Neo Romantic poetic revival took place. Emotions and fantasy were reinstated. The lyric poets of the '90s called themselves "Symbolists," as their object was "to express the inexpressible in symbolic form." Their poems often describe mental processes and religious and mystic experiences. Johannes Jørgensen (1866-) was their leader, he became a convert to Roman Catholicism, and apart from his poetry many of his prose books are widely read, e.g. his *Parables*, his books of travel, his biographies of saints (e.g., of St. Francis and of St. Catherine of Siena) and his autobiography, *Min Livs Legende* (1916-28). Viggo Stuckenberg (1863-1905) is a poet who gives tender expressions of sad resignation. Sophus Clausen (1865-1921) is a lustful and sensual lover of female beauty, a pantheistic lover of nature and a sophisticated and capricious aesthete, whose poems are often obscure riddles. Helge Rode (1870-1937) was a religious mystic, in addition to poetry he also wrote plays and

critical works attacking modern intellectualism. Ludvig Holstein (1864-1945) is a poet more akin to Goethe and Ohlenschläger than to his own generation of Symbolists. Other notable Neo-Romantic poets of the same period were Sophus Michaelis (1865-1931), Thor Lange (1851-1915) and Niels Möller (1859-1941).

Several women made important contributions to Danish literature toward the end of the century and after. Gyrithe Lemche (1866-1945) is well known for her novel cycle *Edvardsgaard*. Agnes Henningsen (1868-) is a brilliant prose writer, whose novels are often concerned with the erotic experiences of the emancipated woman. Karin Michaelis (1872-1950) is a fine psychologist, among her many novels *The Dangerous Age* (1910) is best known.

From 1900 to 1920—The two greatest Danish novelists of the beginning of the 20th century are Martin Andersen Nexø (1869-) and Johannes V. Jensen (q.v., 1873-1950). Andersen Nexø's fame is based almost entirely on his two great epics of proletarian life, *Pelle the Conqueror* (1906-10) and *Ditte Daughter of Man* (1917-21). All his novels and short stories are concerned with the lives of poor people. His *Memoirs* rank among the finest in Danish literature. Jensen, a north Jutlander, expressed his Darwinian philosophy in his long novel cycle *The Long Journey* (1908-22), an ambitious epic of man from the barbaric stage to modern times. His *Himmerlandshistorier* contain forceful descriptions of the people and scenery of northern Jutland, and his novel *The Fall of the King* (1901) holds high rank, his eight volumes of *Myths* are a happy mixture of fiction and essay. He is also a great and original lyric poet and a prolific essayist.

Another Jutlander was Jeppe Aakjær (1866-1930), whose novels of social criticism are less important than his poetry, which has a widely popular appeal. Two other notable Jutland poets were Johan Skjoldborg (1861-1936) and Thøger Larsen (1875-1928).

Jakob Knudsen (1858-1917) is the Carlyle of Denmark, one who believes in the inequality of man and in the necessity of authority and obedience, he discusses Christian and moral problems in his novels, e.g., *Den gamle Præst* and *Lærer Ursin*. The novels of Marie Biegemühl (1867-1940), Harry Søberg (1880-) and Thomas Olesen Løkken (1877-) all contain faithful descriptions of Jutland.

Harald Kilde (1878-1918) is a solitary, introspective and melancholy novelist, preaching a gospel of renunciation and humility, as, for example, in *Age of Eve* and *Halten*. Knud Hjørup (1869-1931) is a keen and intelligent observer, whose novels are mainly psychological. Provincial life is described in a baroque and fanciful manner in the novels of Johannes Buchholtz (1882-1940), e.g., *Egholm and his God* and *The Miracles of Clara van Haag*. Other noteworthy novelists are Hans Povlsen (1886-), Otto Rung (1874-1945), Poul Levin (1869-1929), J. Anker Larsen (1874-), Thut Jensen (1876-) and Astrid Ehrencron Kilde (1874-).

Two important lyrical poets of the period were Valdemar Rørdam (1872-1946) and Kai Hoffmann (1874-1949).

After 1920—The most significant poets of the 1920s were Tom Kristensen (1893-), who was also an important novelist (e.g., *Livets Arabesk* and *Harværk*), Otto Gelsted (1888-), Emil Bønnelycke (1893-1953), Hans Hartvig Seedorff Pedersen (1892-), Harald Bergstedt (1877-) and Per Lange (1901-). Jakob Paludan (1896-) is an important novelist, whose main works are *Birds around the Light* and *Jørgen Sten*. The novels of Hans Kirk (1898-), especially *The Fishermen*, represent social realism at its best. Knuth Becker (1893-) is another social novelist whose main work, a long novel cycle begun in 1932, was still incomplete in the mid-1950s. Harald Hørdal (1900-) is a disciple of Andersen Nexø, his novels reveal the rottenness and the hypocrisy of present society. Mogens Klitgaard (1906-45) and Leif Fischer (1904-) have both been concerned with the middle classes in their novels and short stories.

The novels of Jørgen Nielsen (1902-45) are set among Jutland peasants, and their themes are suppressed feelings, hatred, sin and fear. Similar problems, but in a different milieu are treated in the novels of Michael Tejn (1911-) Aage Dons (1903-)

is a novelist who concentrates on feeling and penetrating analyses of the depths and conflicts of the human soul. H. C. Binner (1903-) is an important novelist and playwright whose works (e.g., *The Riding Master*) deal with the loneliness of man, the dangers of fear and of power. He is a superb short story writer full of outstaring psychological penetration. Martin A. Hunsen (1909-) recalls Johannes V. Jensen in his early novels but later works showed a tendency toward an anti-intellectual mysticism, related to that of the youngest generation of postwar poets. Knud Sønderby (1909-) is a novelist, a short story writer and a playwright with a brilliant style and a deep psychological understanding. Hens Scherfig (1905-) writes novels usually disguised as detective stories, full of acid satire.

Nis Petersen (1897-1943) holds a high position as a poet and is also a distinguished novelist (e.g., *The Street of the Sandals* and *Spilt Milk*). Karen Blixen (1885-) whose first novel, *Seven Gothic Tales*, was first published in English under the nom de plume of Isak Dinesen in 1934, is a refined aristocratic writer, with a subtle irony and with an unusual elegance and sensitivity. Her books *My African Farm* and *Winter's Tales* should also be mentioned. Two Faroese novelists have also made significant contributions to contemporary Danish literature: Jørgen Frantz Jacobsen (1900-38) and Willum Hønenes (1900-).

Sven Clausen (1893-) and Svend Borberg (1888-1946) represent the first postwar generation of Danish playwrights influenced by German expressionism, by symbolism, by Luigi Pirandello and by Sigmund Freud. Kaj Munk (1898-1944) is a dramaticist of unusual qualities, who revived the "heroic Shakespearean and Schillerian drama." Among his best plays are *En Idealist* and *Ordet*. He was a religious agitator who used the stage as a pulpit, and all his dramas are concerned with the problems of God and man. Kjeld Abell (1901-) is an iconoclast both as far as form and content are concerned. His first plays mark a complete break with naturalistic drama, and there is always a deep and radical perspective underlying his remarkably witty and sparkling dialogue. His most important plays are *The Melody that Got Lost* and *Anna Sophie Hedvig*. C. B. Sora (1896-) is yet another brilliant playwright as well as a short story writer and a novelist.

Kaj Fris Møller (1888-) is a distinguished poet and critic also a fine translator of French and English poetry. Paul I. Cour (1902-) is a lyrical poet influenced by the modern French intellectual school. Other poets who have already established their names in Danish literature are Hilda I. Utken (1896-1948), Jens August Schade (1903-), Alex Garff (1904-), Tove Ditlevsen (1918-), who is also a fine novelist and short story writer, and Morten Nielsen (1922-44). The most interesting lyrical poets of the mid 20th century were Ole Sarvig, Ole Abildgaard, Ole Wivel, Halldan Rasmussen, Frank Jæger Thorkild Bjørnvig, Erik Knudsen, Grethe Helberg and Grete Rinsberg-Thomsen. The leading literary scholars and critics of the century were Axel Olrik (1864-1917), Vilhelm Andersen (1864-1953), Valdemar Vedel (1865-1942), Hans Brax (1870-), Vilhelm Grønbech (1873-1948) and Paul V. Rubow (1896-). In the field of philosophy Harald Høffding (1843-1931) and Herbert Ivesen (1890-1920) were the most prominent names.

DANKL, VIKTOR, FREIHERR VON (1854–), Austro-Hungarian general, was born in Udine on Sept. 18 1854. In the World War he commanded at the outset the I Army and defeated the Russians in the battle of Krassnik (Aug. 23–25, 1914). After the Italian declaration of war he became in May 1915 commander of the defence forces in Tirol. As an army commander in the following years he took a successful part in the offensive against Asiago Asolo, but shortly afterwards retired from his post on account of ill health.

DANNAT, WILLIAM T. (1853–1929), American artist, was born in New York city in 1853. He was a pupil of the Royal Academy of Munich and of Munich and became an accomplished draughtsman and a distinguished figure and portrait painter. He early attracted attention with sketches and pictures made in Spain and a large composition, "The Quartette," now in the Metropolitan Museum of Art, New York, was one of the successes of the Paris Salon of 1884. Dannat settled in Paris, he is represented in the Luxembourg, was president of the Paris Society of American Painters and a member of the National Institute of Arts and Letters. He died in France on March 12, 1929.

DANNECKER, JOHANN HEINRICH VON (1758–1841), German sculptor, was born at Stuttgart, on Oct. 15, 1758, and died there on Dec. 8, 1841. His father was employed in the stables of the duke of Württemberg. The boy was entered in the military school at the age of 13, but after two years he was allowed to follow his taste for art. The duke made him sculptor to the palace (1780), and employed him on child angels and caryatids for the decoration of the reception rooms. In 1783 he left for Paris with Scheffauer, and placed himself under Pajou, in 1785 he went to Rome, where he worked for five years. Goethe and Herder were then in Rome, and became his friends, as well as Canova, who was the hero of the day, and who had undoubtedly a great and powerful influence on his style. The marble statues of Ceres and Bacchus (in the Schloss at Stuttgart) were done at this time. On his return to Stuttgart, which he never afterwards quitted, except for short trips to Paris, Vienna and Zurich, the double influence of his admiration for Canova and his study of the antique is apparent in his works. The Ariadne (1806), in the Bethmann museum, Frankfurt, is the most popular of his works. Many of the illustrious persons of the time were modelled by him, among others, Lavater, Metternich, Countess Stephanie of Baden and General Bendorff. Of the three portrait busts of Schiller the first in date (1797) is life size, and is at Weimar, the second, modelled in colossal size, is in the Stuttgart museum, the third was made for the then Crown Prince Louis of Bavaria. Dannecker was director of the Gallery of Stuttgart, and received many academic and other distinctions.

DANNEWERK or DANEWERK (Dan, *Danneværke* or *Danesvirke*, "Danes' rampart"), the ancient frontier rampart of the Danes against the Germans, extending 104 mi. from just south of the town of Schleswig to the marshes of the river Treene near the village of Helligstedt. The rampart was begun by Gutofr (Godefridus), king of Vestfold, early in the 9th century. In 934 it was passed by the German king Henry I, after which it was extended by King Harold Bluetooth (940–986), but was again stormed by the emperor Otto II in 974. The chronicler Saxo Grammaticus mentions in his *Gesta Danorum* the "rampart of Jutland" (*Jutiae moenia*) as having been once more extended by Valdemar the Great (1177–82), which has been cited among the proofs that Schleswig (*Synderylland*) forms an integral part of Jutland (Manuel *hist. de la question de Slesvig*, 1906). After the union of Schleswig and Holstein under the Danish crown, the Danewerke fell into decay, but in 1848 it was hastily strengthened by the Danes, who were, however, unable to hold it in face of the superiority of the Prussian artillery, and on April 23 it was stormed. From 1850 onwards it was again repaired and strengthened at great cost, and was considered impregnable, but in the war of 1864 the Prussians turned it by crossing the Schlei, and it was abandoned by the Danes on Feb. 6 without a blow. It was thereupon destroyed by the Prussians, in spite of which, however, a long line of imposing ruins still remains. The systematic excavation of these, begun in 1900, has yielded some notable finds,

especially of valuable runic inscriptions (F. de Jessen, *La Question de Slesvig*, pp. 25, 44–50, etc.).

See Lorenzen, *Danneværke og Omegn* (2nd ed., Copenhagen, 1864), H. Handlemann, *Das Dannewerk* (Kiel, 1885), Philippsen and Sunkens *Führer durch das Dannewerk* (Hamburg, 1903).

DANNREUTHER, EDWARD (1844–1905), German pianist, teacher and writer on music, was born at Strisburg on Nov. 4, 1844, and was brought up in the United States. He studied music (1859–63) at Leipzig under Moscheles, Hauptmann and Richter, and settled in London in 1863. There he rendered great service to the English musical world in a variety of ways—by his own interpretations of the great German classics, by his musical writings in general, and by his propagandist labours on behalf of Richard Wagner in particular. He was professor of the piano at the Royal College of Music from 1895. Dannreuther's principal works are *Musical Ornamentation* (1893–95), the standard English work on the subject, and vol. vi ("The Romantic Period") of the *Oxford History of Music*.

DANSVILLE, a village of Livingston county, New York, U.S.A., 49 mi. S. of Rochester, adjoining Stony Brook state park. It has an airport, and is served by the Dansville and Mount Morris and the Lackawanna railways. Pop. (1950) 5,38. Large nurseries for growing fruit and ornamental trees and several manufacturing plants are there. The *Instructor*, a magazine for teachers, with a national circulation, is published there. Dansville Memorial hospital is located there. Clara Barton established the first chapter of American Red Cross in Dansville, Aug. 1881. Dansville was settled about 1800 and incorporated in 1845.

DANTAN, JEAN PIERRE (1800–1869), French sculptor, born in Paris on Dec. 28, 1800. His father was a carver in wood, and Jean in company with his brother Antoine Laurent were trained in his studio. The two brothers then studied under Bosio and in 1828 went to Rome. On his return to Paris Jean Pierre became known for his caricature statuettes. He portrayed many famous men (Talleyrand, Wellington, Rothschild, William IV, Brougham, Liszt, Victor Hugo and many others). He died in Baden-Baden on Sept. 6, 1869.

ANTOINETTE LAURENT DANTAN (1798–1878), brother of Jean Pierre, made many monuments for churches, public buildings and squares (St. Raphael in the Madeleine, Paris, St. Duquesne in Dieppe, La Place in Caen).

JOSEPH EDUARD DANTAN (1848–1897), French historic painter, son of Jean Pierre, studied under Pils. He exhibited regularly in the Salon des Artistes Français, and he also illustrated Zola and Victor Hugo.

DANTE (or **DURANTE**) **ALIGHIERI** (1265–1321), the greatest of Italian poets, was born at Florence about the middle of May 1265. He was descended from an ancient family, but from one which at any rate for several generations had belonged to the burgher and not to the knightly class. Dante himself does not, with the exception of a few obscure and scattered allusions, carry his ancestry beyond the warrior Cacciaguida, whom he met in the sphere of Mars (*Par. xv 87 seq.*). Of Cacciaguida's family nothing is known. The name, as he told Dante (*Par. xv 130, 135*), was given him at his baptism. He further tells his descendant that he was born in the year 1091, and that he married a lady from the valley of the Po, from whom the name Alighieri or Alighieri passed to his descendants. He also mentions two brothers, Morante and Eliseo, and that he accompanied the emperor Conrad III upon his crusade into the Holy Land, where he died (1147) among the infidels. From Alighiero, son of Cacciaguida, were descended the Alighieri Bellincione, son of Alighiero, was the grandfather of Dante. His father was a second Alighiero of whom little is known. Dante appears to have been the son of Alighiero's first wife, Bella, whose family name is doubtful. By his second wife, Lapa di Chiarissimo Caluffi, Alighiero had a son Francesco and a daughter Tana (Gaetana), another daughter, who married Leone Roggi and whose name is not known, was perhaps the poet's sister. Thus the family of Dante held a most respectable position among the citizens of his beloved city, but had it been reckoned in the very first rank they could not have remained in Florence

after the defeat of the Guelphs at Montaperti in 1260. It is clear, however, that Dante's mother at least did so remain, for Dante was born in Florence in 1265. The heads of the Guelph party did not return till 1267.

Apart from his love for Beatrice, we know very little of Dante's boyhood and early life. His early biographers, Boccaccio and Leonardo Bruni, represent him as an assiduous student. From

the age of 18 he, like most cultivated young men of that age, wrote poetry assiduously, in the philosophical amatory style of which his friend, older by some years than himself, Guido Cavalcanti, was a great exponent, and of which Dante regarded Guido Guinicelli of Bologna as the master (*Purg.* xxvi 97, 8). He doubtless owed much to the paternal influence of Brunetto Latini (*d.* 1294), the philosopher and rhetorician, who figured largely in the councils of the Florentine commune. Of Brunetto Latini Dante himself speaks with the most loving gratitude and affection, though he does not hesitate to brand his vice with infamy. He had some knowledge of drawing, at any rate he tells us that on the anniversary of the death of Beatrice he drew an angel on a tablet, he is said to have been an intimate friend of Giotto, who has immortalized his youthful lineaments in the chapel of the Bargello. Nor was he less sensible to the delights of music. Milton had not a keener ear for the loud uplifted angel trumpets and the immortal rhaps of golden wires of the cherubim and seraphim, and the English poet was proud to compare his own friendship with Henry Lawes with that between Dante and Casella, "met in the milder shades of purgatory." There is some evidence that Dante was at Bologna not later than 1287, but it is doubtful whether, as Boccaccio states, he studied at the university. It is clear that, from his youth onwards, he began to make himself master of all the sciences of his time, while playing his part in society and in touch with every aspect of Florentine life.

Political Life.—We must now consider the political circumstances in which lay the activity of Dante's manhood. From 1115, the year of the death of Matilda, countess of Tuscany, Florence developed as a self governing commune attached to the cause of the Church. According to tradition, the Guelph and Ghibelline factions were introduced into the city in 1215. Buondelmonte de' Buondelmonti, a noble youth of Florence, being engaged to marry a lady of the house of Amidei, allied himself instead to a Donati, and was attacked and killed by the Amidei and Uberti at the foot of the Ponte Vecchio, close by the pilaster which bore the image of Mars (*Par.* xvi 136-147). Although a number of noble families, headed by the Uberti, now ranged themselves with the Ghibellines, the commune remained Guelph, but, in 1248, with the aid of German horsemen sent by Frederick II, the Uberti and the Ghibellines gained the upper hand and expelled the Guelph nobles. In 1250, when the emperor was dying, there was a revolution by the Primo Popolo, the first democratic constitution of the republic, was established, with a captain of the people to counterbalance the podestà, and the Guelphs were recalled. The Uberti and other Ghibellines—in understanding with Manfred who had succeeded his father Frederick as king of Sicily—attempted to rebel in 1258, were expelled from the city and their houses and towers destroyed. The reception of the exiles in Siena brought on the war which resulted in the great battle of Montaperti, Sept. 4, 1260, "which dyed the Arbia red," in which the Florentine Guelphs and their allies were completely defeated by the Senese and the German troops of Manfred. At a congress at Empoli, in which the Ghibelline cities of Tuscany were represented, it was proposed to destroy Florence—a proposal defeated by the bold patriotism of Farninata degli Uberti (*Inf.* x 91-93).

PORTRAIT OF DANTE FROM A WOOD CUT OF 1521

The Ghibellines now held sway in Florence as elsewhere in Tuscany, until Charles of Anjou—to whom the pope had offered the crown of Apulia and Sicily—came to Italy, and on Feb. 26, 1266, defeated and killed Manfred at Benevento. In 1267 the Guelphs were recalled, and the Ghibellines were driven out. Florence was for a while under the suzerainty of Charles of Anjou, but in 1282, after the "Sicilian Vespers," the *Secondo Popolo*—the second democratic constitution of Florence—was established. By this the government was placed in the hands of the Priors of the Arts, who, associated with the Captain of the People, became the chief magistrates of the republic. The Arts or Guilds—seven *maggiors* and 14 *minori*—were organized, to be the backbone of the State. The Priors, elected from the Arts were six in number and held office for two months. Siena had become Guelph, but Pisa and Arezzo remained Ghibelline, and Florence led a Guelph Tuscan league against them in a war which culminated on June 11, 1289, at Campaldino near Poppi, in the Casentino, where the Ghibellines were utterly defeated. They never again recovered any hold in Tuscany but the violence of faction survived under other forms. Several allusions in the *Commedia* (*Inf.* xiii 1, xvi 95, *Purg.* v 92) indicate that Dante saw military service in this war, and a passage in a letter of his, no longer extant but quoted by Leonardo Bruni, states that he fought in the front rank at Campaldino.

Meeting with Beatrice.—As he tells us in the *Vita Nuova*, Dante had first met the girl whom he calls Beatrice, the love for whom was to be the guiding star and inspiration of his life, in 1274, when she was at about the beginning of her ninth year, and he at about the end of his ninth year. If she has been rightly identified with Bice Portinari, she married Simone de' Bardi. Beatrice died on June 8, 1290 (the date June 9 is due to a mystification in the *Vita Nuova*). The last chapter of the *Vita Nuova* relates how, after the lapse of some undefined time, "it was given me to behold a wonderful vision, wherein I saw things which determined me to say nothing further of this blessed one until such time as I could discourse more worthily concerning her. And to this end I labour all I can, as she in truth knoweth. Therefore if it be His pleasure through Whom is the life of all things that I write continue with me a few years, it is my hope that I shall yet write concerning her what hath not before been written of any woman. After the which may it seem good unto Him who is the lord of courtesy that my spirit should go hence to behold the glory of its lady, to wit, of that blessed Beatrice who now gloriously gazes on the countenance of Him *qui est per omnia secula benedictus*." In the *Convivio* he resumes the story of his life. "When I had lost the first delight of my soul (that is, Beatrice) I remained so pierced with sadness that no comforts availed me anything, yet after some time my mind, desirous of health, sought to return to the method by which other disconsolate ones had found consolation, and I set myself to read that little-known book of Boetius in which he consoled himself when a prisoner and an exile. And hearing that Tully had written another work, in which, treating of friendship, he had given words of consolation to Laelius, I set myself to read that also." At some unascertained date, perhaps about 1292, he married Gemma, daughter of Manetto Donati, a connection of the celebrated Corso Donati, afterwards the leader of the party opposed to Dante's own. By this wife he had two sons, Jacopo and Pietro, and either one or two daughters (Antonia being perhaps the same as the daughter who became a nun, Suora Beatrice at Ravenna). Although he never mentions his wife in the *Divina Commedia*, and although she did not accompany him into exile, there is no clear evidence for the belief that the union was otherwise than happy. Certain it is that he spares the memory of Corso in his great poem and speaks with affection of his kinsmen Piccarda and Forese, the latter of whom was one of his own intimate friends.

In 1293 Giano della Bella, a man of old family who had thrown in his lot with the people, induced the commonwealth to adopt the so-called "Ordinances of Justice," a severely democratic constitution, by which among other things it was that no man of noble family even though engaged in tr.

hold office as prior, or be a member of the popular councils of the State, and a new magistrate, the *Gonfaloniere di Giustizia*, was added to the Signoria. Two years later Gino was banished, but the ordinances remained in force, though their severity was modified.

Banishment.—Dante now began to take an active part in politics. He was included in the *arte* of the *Medici* and *Spesali*, which made him eligible for the priorate. Documents still existing in the archives of Florence show that he took part in the deliberations of the several councils of the city from the latter part of 1295 onwards, and there is record of an important speech of his in the Council of the Hundred on June 5, 1296. In May 1300 he served on a special embassy, to the commune of San Gimignano. From June 1, to Aug. 14, 1300, he sat in the Signoria as one of the six Priors, which, he says, was the cause and origin of all his misfortunes. The spirit of faction had again broken out in Florence. The two rival families were the Cerchi and the Donati—the first of great wealth but recent origin, the last of ancient ancestry but poor. A quarrel had arisen in Pisa between the two branches of the Cancellieri—the Bianchi and Neri, the Whites and the Blacks. The quarrel spread to Florence, the Donati took the side of the Blacks, the Cerchi of the Whites. Pope Boniface was asked to mediate and sent Cardinal Matteo d'Acquaperta to maintain peace. He arrived just as Dante entered upon his office as prior. The cardinal effected nothing, but Dante and his colleagues banished the heads of the rival parties in different directions to a distance from the capital. The Blacks, including Corso Donati, were sent to Città della Pieve in the Tuscan mountains, the Whites, among whom was Dante's dearest friend Guido Cavalcanti, to Sarzana in the unhealthy Maremma. After the expiration of Dante's office the banished Whites were allowed to return, Guido Cavalcanti so ill with fever that he shortly afterwards died. In the following year, 1301, in consequence of a treasonable meeting in the church of S. Trinità a number of the Blacks were banished and a fresh sentence passed against Corso Donati. The Whites now controlled the politics of Florence, and expelled the Blacks from Pisa.

In this same year, 1301, we have several records of Dante's political activity. One of these is noteworthy. The pope had demanded the service of 100 Florentine horsemen and on June 19, in the council of the Hundred, Dante urged "*Quod de servitio faciendo domino Papae nihil fiat*," thus showing himself a firm opponent to papal interferences in Florentine politics. Pope Boniface had already sent for Charles of Valois, brother of the French king Philip the Fair, to act as "peacemaker." The priors sent at the beginning of October, three ambassadors to the pope, one of whom, according to the chronicler Dino Compagni, was Dante. Charles entered Florence on All Saints' day, 1301, and was followed by Corso Donati and his allies. The Blacks, restored to power, appointed Dante de' Gabrielli of Gubbio as podestà, a man devoted to their interest. More than 600 Whites were condemned to exile and cast as beggars upon the world. On Jan. 27, 1302, Dante with four others of the White party, was charged before the podestà with *baratteria*, or corrupt practices in and out of office and with offences against the Guelph party, and, not appearing, was condemned to pay a fine of 5,000 lire of small florins. If the money was not paid within three days their property was to be destroyed, if they did pay the fine they were to be exiled for two years from Tuscany and never again to hold office in the republic. Dante's innocence of "barattery" is unquestionable. His real offence was his opposition to the power of Boniface and his Florentine supporters. On March 10 Dante and the others were condemned to be burned alive if they should come into the power of the republic.

Dante's Wanderings in Exile.—It is probable that Dante never returned from his embassy to the pope. Leonardo Bruni says that he received the news of his banishment at Siena. He probably joined his fellow exiles who met at Gargnano a castle between Siena and Arezzo, and made Arezzo their headquarters in preparation to make their way back to Florence by turns. On Jan. 9, 1302, a meeting was held at San Gimignano, a place in the

Florentine territory, Dante's presence at which is proved by documentary evidence and an alliance was there made with the powerful Ghibelline clan of the Ubaldini. In Sept. 1303 the flood of his had entered Anagni, and Christ had a second time been made prisoner in the person of his vicar (*Purg.* xv. 86-90). Boniface did not survive the insult long but died in the following month. He was succeeded by Benedict XI, and in March 1304 the cardinal Niccolò di Prato came to Florence sent by the new pope to make peace. The people received him with enthusiasm, ambassadors came to him from the Whites, and he did his best to reconcile the two parties. But the Blacks resisted all his efforts. He shook the dust from off his feet, and departed, leaving the city under an interdict. In July with aid from the Ghibellines of Tuscany and other regions, the exiles made an unsuccessful attempt to enter Florence from Livorno, the failure of which further disorganized the party.

Dante had, however, already separated from the "ill conditioned and foolish company" (*Par.* xvii. 61-69) of his fellow exiles who rejected his counsels of wisdom, and had learnt that he must henceforth form a party by himself. He appears to have been for a while at Forlì in Romagna, of which city Scropetta degli Ordelaffi was lord, and, probably towards the end of 1303, he went to Bartolomeo della Scala, lord of Verona, where the courtesy of the great Lombard gave him his first refuge and his first hospitable reception. Can Grande, to whom he afterwards dedicated the *Paradiso*, was then a boy. Bartolomeo died in 1304, and it is possible that Dante may have remained in Verona till his death. It is very difficult to determine with exactness the order and the place of Dante's wanderings. He was probably at Bologna in 1304 and 1305. A rather questionable document attests his presence at Padua in Aug. 1306, the time when Giotto was working upon the frescoes of the Madonna dell' Arena. In Oct. 1306 he was unquestionably the guest of the Marchesses of the house of Malaspina in Lunigiana, where he acted as their ambassador in making peace with the bishop of Luni. From this time till the arrival of the emperor Henry VII. in Italy, Oct. 1310, all is uncertain. His old enemy Corso Donati had at last allied himself with Ugucione della Faggiuola, the leader of the Ghibel lines, and in 1308 was declared a traitor, attacked in his house, put to flight and killed.

It is not impossible that Dante about this time visited Paris, but that he ever crossed the Channel or went to Oxford may safely be disbelieved. The election in 1308 of Henry of Luxemburg as emperor stirred again his hopes of a deliverer. At the end of 1310, in a letter to the princes and people of Italy, he proclaimed the coming of the saviour, at Milan he did personal homage to his sovereign. The Florentines, in alliance with King Robert of Naples, made every preparation to resist the emperor. Dante wrote from the Casentino a letter dated March 31, 1311, in which he rebuked them for their stubbornness and obstinacy and another on April 27, to the emperor himself, upbraiding his delay and urging him on against Florence. A new sentence against the poet was pronounced on Sept. 2. Henry passed from Genoa to Pisa, and on June 29, 1312, was crowned by the pope's legates in the church of St. John Lateran at Rome, the Vatican being in the hands of his adversary King Robert of Naples. Then at length he moved towards Tuscany and reached Florence on Sept. 19. He did not dare to attack it, but returned in November to Pisa. In the summer of the following year he prepared to invade the kingdom of Naples, but in the neighbourhood of Siena he caught a fever and died at the monastery of Buonconvento, on Aug. 24, 1313. He lies in the Campo Santo of Pisa, and the hopes of Dante and his party were buried in his grave.

After the death of the emperor Henry (Bruni tells us) Dante joined the rest of his life as an exile, sojourning in various places throughout Lombardy, Tuscany and the Romagna, under the protection of various lords, until at length he retired to Ravenna where he ended his life. After the death of the French pope (Benedict X.) he addressed a letter, in the spring or summer of 1314, to the cardinal in conclave, urging them to restore the papacy to Rome. About this time he probably came to Lucca, the town conquered by Ugucione della Faggiuola. In May

1315 a general recall of exiles offered Dante an opportunity of returning to Florence. The conditions given to the exiles were that they should pay a fine and be subjected to the ceremony of oblation as penitents in the Baptistery. Dante refused to tolerate this shame, and the letter is still extant in which he declines to enter Florence except with honour secure that the means of life will not fail him, and that in any corner of the world he will be able to gaze at the sun and the stars, and meditate on the sweetest truths of philosophy. In Aug. 1315, Uguccone won the great battle of Montecatini over the united arms of Florence and Naples, but lost Pisa and Luca at the beginning of the following year. A fresh sentence of death had been pronounced by Florence upon Dante in Nov. 1315, and he seems now to have taken refuge with his most illustrious protector Can Grande della Scala of Verona, then a young man of 25, rich, liberal and the favoured head of the Ghibelline party, whose name has been immortalized by an eloquent panegyric in the 17th canto of the *Paradiso*.

The last few years of the poet's life were spent at Ravenna under the protection of Guido da Polenta. In his service Dante undertook an embassy to the Venetians, on his return from which he caught a fever and died in Ravenna on Sept. 14, 1321. His bones still repose there. His doom of exile has been reversed by the union of Italy which has made the city of his birth and the various cities of his wanderings component members of a common country. His son Piero, who wrote a commentary on the *Divina Commedia*, settled as a lawyer in Verona, and died in 1364. His daughter Beatrice lived as a nun in Ravenna, dying at some time between 1350 (when Boccaccio was commissioned to bring her a present of ten gold crowns from a Florentine guild) and 1371. His direct line became extinct in 1509.

The *Divina Commedia*—Of Dante's works, that by which he is known to all the educated world, and in virtue of which he holds his place as one of the half dozen greatest writers of all time, is of course the *Commedia*. (The epithet *divina*, it may be noted, was not given to the poem by its author, nor does it appear on a title page until the 16th century.) The poem is absolutely unique in literature, it may safely be said that at no other epoch of the world's history could such a work have been produced. Dante was steeped in all the learning, which in its way was considerable, of his time, he had read the *Summa Theologica* of Aquinas, the *Treasure* of his master Brunetto, and other encyclopaedic works available in that age, he was familiar with most of what was then known of the Latin classical and post-classical authors. Further, he was a deep and original political thinker, who had himself borne a prominent part in practical politics. The age was essentially one of great men, of free thought and free speech, of brilliant and daring action, whether for good or evil. It is easy to understand how Dante's bitterest scorn is reserved for those "sorry souls who lived without infamy and without renown, displeasing to God and to His enemies."

The time was thus propitious for the production of a great imaginative work, and the man was ready who should produce it. It called for a prophet, and the prophet said, "Here am I." "Dante," says an acute writer, "is not, as Homer is, the tribher of poetry springing in the freshness and simplicity of childhood out of the arms of mother earth, he is rather like Noah the father of a second poetical world, to whom he pours forth his prophetic song fraught with the wisdom and the experience of the old world." Thus the *Commedia*, though often classed for want of a better description among epic poems, is totally different in method and construction from all other poems of that kind. Its "hero" is the narrator himself, the incidents do not modify the course of the story, the place of episodes is taken by theological or metaphysical disquisitions, the world through which the poet takes his readers is peopled, not with characters of heroic story but with men and women known personally or by repute to him and those for whom he wrote. Its aim is not to delight, but to reprove, to rebuke, to exhort, to form men's characters by teaching them what courses of life will meet with reward, what with penalty, hereafter, "to put into verse," as the poet says, "things difficult to think." For such new matter a new vehicle

was needed. We have Bembo's authority for believing that the *terza rima* surpassed if at all, only by the ancient hexameter, as a measure equally adaptable to sustained narrative to debate, to fierce invective to clear-cut picture and to trenchant epigram, was first employed by Dante.

The action of the *Commedia* opens in the early morning of the Friday before Easter in the year 1300. The poet finds himself lost in a forest, escaping from which to ascend the mountain of felicity, he has his way barred by a wolf, a lion and a leopard. This seems to indicate that at this period of his life about the age of 35, Dante went through some experience akin to what is now called 'conversion.' The strong vein of mysticism, found in so many of the deepest thinkers of that age, and conspicuous in Dante's mind, no doubt played its part. His efforts to free himself from the 'forest' of worldly cares were impeded by the temptations of the world—cupidity (including ambition), the pride of life and the lusts of the flesh, symbolized by the three beasts. But a helper is at hand. Virgil appears and explains that he has a commission from three ladies on high to guide him. The ladies are the Blessed Virgin (representing the Divine Mercy), St. Lucy (symbol of illuminating grace) and Beatrice. In Virgil we are apparently intended to see the symbol of what Dante calls philosophy, what we should rather call natural religion, Beatrice standing for theology, or rather revealed religion. Under Virgil's escort Dante is led through the two lower realms of the next world Hell and Purgatory meeting on the way with many persons illustrious or notorious in recent or remote times as well as many well enough known then, but who, without the immortality, often unobtainable, that the poet has conferred on them, would long ago have been forgotten. Popes, kings, emperors, poets and warriors, Florentine citizens of all degrees are there found, some doomed to hopeless punishment, others expiring their offences in milder torments, and looking forward to deliverance in due time. It is remarkable to notice how rarely, if ever Dante allows political sympathy or antagonism to influence him in his distribution of judgment. Hell is conceived as a vast conical hollow, reaching to the centre of the earth. It has three great divisions, corresponding to Aristotle's three classes of vices, incontinence, brutishness (which Dante identifies with violence) and malice. The first is outside the walls of the city of Dis, the second is within. The sinners by malice, which includes all forms of fraud or treachery lie at the bottom of a gigantic pit, called Malebolge with vertical sides, and accessible only by supernatural means—a monster named Geryon bearing the poets down on his back. The torments here are of a more terrible, often of a loathsome character. Ignominy is added to pain, and the nature of Dante's demeanour towards the sinners changes from pity to hatred.

At the very bottom of the pit is Lucifer, immovably fixed in ice, clumping down his limbs they reach the centre of the earth whence a current conducts them back to the surface at the foot of the purgatorial mount on which they reach as Easter Day is dawning. Before the actual Purgatory is attained they have to climb for the latter half of the day and rest at night. The occupants of this outer region are those who have delayed repentance till death was upon them. They include many of the most famous men of the last 30 years. In the morning the gate is opened, and Purgatory proper is entered. This is divided into seven terraces, corresponding to the seven deadly sins which encircle the mountain and have to be reached by a series of steep climbs, compared by Dante in one instance to the path from Florence to Samminato. The purifying penalties are not degraded, but rather tests of patience or endurance and borne voluntarily by the souls, in several cases Dante has to bear a share in them as he passes. On the summit is the Earthly Paradise. Here Beatrice appears in a mystical pageant. Virgil departs, leaving Dante in her charge. By her he is led through the various spheres of which, according to both the astronomy and the theology of the time, Heaven is composed to the supreme Heaven, or Empyrean, the seat of the Godhead. For one moment there is granted him the intuitive vision of the Divine, and the comprehension of all mysteries, which is the ultimate goal of

mystical theology, his will is wholly blended with that of God, and the poem ends. The date of composition of the *Commedia* is still uncertain, but the *Paradiso* was unquestionably written in the last years of Dante's life.

Other Works.—The *Vita Nuova* (*Young Life* or *New Life*), for both significations seem to be intended) contains the history of Dante's love for Beatrice. He describes how he met Beatrice as a child, himself a child, how he feigned a false love to hide his true love, how he fell ill and saw in a dream the death and transfiguration of his beloved, how she died, and how the tender compassion of another lady nearly won his heart from its first affection, how Beatrice appeared in his imagination and reclaimed his heart, and how at last he saw a vision which induced him to devote himself to study that he might be more fit to glorify her who gazes on the face of God for ever. It is in the form of lyrics—canzoni, one ballata, and sonnets—set in a prose narrative with scholastic divisions and explanations, and was probably completed about 1293, though the reference to the vision may be later.

The *Convivio* or *Banquet* (less accurately *Convito*) is the work of Dante's manhood, as the *Vita Nuova* is the work of his youth. It consists, in the form in which it has come down to us, of an introduction and three treatises, each forming an elaborate commentary on a long canzone. It was intended, if completed, to have comprised commentaries on 11 more canzoni, making 14 in all, and in this shape would have formed a *tesoro* or handbook of universal knowledge, such as Brunetto Latini and others have left to us. It is perhaps the least well known of Dante's Italian works, but contains many passages of great beauty and elevation, the magnificent apotheosis of Rome and her empire in the fourth treatise being the first expression of his ideal imperialism. Indeed a knowledge of it is quite indispensable to the full understanding of the *Divina Commedia* and the *Monarchia*. It was probably written between 1304 and 1308.

Besides the poems contained in the *Vita Nuova* and *Convivio*, Dante composed a considerable number of canzoni, ballate and sonnets which are collected under the general title of *Rime* or *Canzoniere*, and which secure him a place among lyrical poets scarcely if at all inferior to that of Petrarch. Some scholars—very questionably—would attribute to Dante a rendering of the *Roman de la Rose* in 232 sonnets entitled *Il Fiore* (*The Flower*).

The treatise *De vulgari eloquentia* in Latin, is mentioned in the *Convivio*. It was probably written between 1304 and 1306. Its object was first to establish the Italian language as a literary tongue, and to distinguish the noble or "courtly" speech which might become the property of the whole nation, at once a bond of internal unity and a line of demarcation against external nations, from the local dialects peculiar to different districts, and secondly, to lay down rules for poetical composition in the language so established. The work was intended to be in four books, but only two are extant. The first of these deals with the language, the second with the style and with the composition of the canzone. It contains much acute criticism of poetry and poetic diction, and its treatment of the Italian dialects is of singular interest.

The Latin treatise *Monarchia*, in three books, contains the mature statement of Dante's political ideas. In it he propounds the theory that the universal temporal monarchy or empire is necessary for the well being of the world, that the Roman people acquired this dignity by right, and that the authority of the emperor depends immediately upon God though he must reverence the pope as the first born of the Father. Pope and emperor are the guides divinely appointed to lead the human race to eternal life and temporal felicity. Dante's ideal of the empire is a power above national conflicts to preserve universal peace and liberty, in order that the goal of civilization the realization of all man's potentialities may be achieved. The work was probably composed at the time of the descent of Henry VII into Italy, between 1310 and 1313. The book was first printed by Oporinus at Basle in 1559, and placed on the Index of forbidden books.

In the last years of his life Dante wrote two eclogues in Latin, an answer to Giovanni del Virgilio, who invited him to compose a

Latin poem on some contemporary event and come from Ravenna to Bologna to receive the laurel crown. The most interesting passage is that in the first poem (1319) where he expressed his hope that when he has finished the third part of the *Commedia* his grey hairs may be crowned with laurel on the banks of the Arno.

The *Questio de aqua et terra* purports to be a discourse which Dante delivered at Verona in June 1320 as a solution of the question which was being at that time much discussed—whether in any place on the earth's surface water is higher than the earth. It was first published at Venice in 1508, by an ecclesiastic named Moncetti. Since Dr. Moore, from internal evidence, made out a very strong case for it, its authenticity has been generally accepted.

There are 13 Latin letters ascribed to Dante. Those to the princes and peoples of Italy announcing the coming of Henry of Luxemburg, to the Florentines, to the emperor himself, to the Italian cardinals and to a Florentine friend refusing the base conditions of return from exile, have been already mentioned. These are certainly authentic, as probably is also a long letter to Can Grande della Scala, containing directions for interpreting the *Divina Commedia*, with especial reference to the *Paradiso*. Of less importance are the letters to cardinal Niccolò da Prato, to the nephews of Count Alessandro da Romena, to the marquises Morcello Malaspina, to Cino da Pistoia, and three written in the name of the Countess of Battifolle.

Dante's reputation has passed through many vicissitudes, and much trouble has been spent by critics in comparing him with other poets of established fame. Read and commented upon with more admiration than intelligence in the Italian universities in the generation immediately succeeding his death, his name became obscured as the sun of the Renaissance rose higher towards its meridian. His fame is now fully vindicated as one of the world's universal poets and the national poet of Italy.

(A J Bu, E G G)

BIBLIOGRAPHY.—We have now two authoritative editions of the text of the complete *Opere di Dante* the *testo critico* of the Società Dante Alighiana, edited by M. Barbi and others on the occasion of the sixth centenary (Florence, 1921), reproducing the forms and orthography of the poet's own time, the *Oxford Dante* of Edward Moore revised and re-edited by Paget Toynbee (1923). Dr. Toynbee's *Concise Dictionary of Proper Names and Notable Matters in the Works of Dante* (1914) is invaluable. Concordances—based upon editions previous to the *testo critico*, but still highly useful—to the *Commedia* by E. A. Eay (Boston, 1888), to the minor Italian works by E. S. Sheldon and A. C. White (1905) and to the Latin works by E. K. Rand and E. H. Wilkins (1912), are due to American scholars.

Editions of the Divina Commedia and Commentaries. The first three editions of the *Commedia* were printed in 1472 at Foligno, Mantua and Jesi. They were reprinted, together with the Neapolitan edition of 1471, by Lord Vernon and A. Panizza in *La Prime Quattro Edizioni della D. C. letteralmente ristampate* (1858). The first Venetian edition is of 1477, the first Milanese (Nidobestina) of 1478, the first Florentine of 1481. In 1502 Aldus produced the first "pocket" edition in his new "italic" type. The *Commedia* began to be the subject of commentaries as soon as the author was in his grave, beginning, before 1350, with those of Dante's son, Jacopo Alighieri, and Grazzoli de' Bambaglioli of Bologna on the *Inferno*, and of another Bolognese, Jacopo della Lana, on the whole poem. Somewhat later, but still before 1350, come the *Optimo Commento* attributed to the Florentine notary Andrea Lancia, and those of Dante's other son, Pietro, and the Carthusians delivered at Florence in 1372, stops short at *Inf. viii*, it is accessible, together with the two versions of his famous life of Dante, edited by D. Guerri, in the *Scrittori d'Italia* series (Bari, 1918). The great Latin commentary of Boccaccio's disciple, Benvenuto da Imola (1375-80), who lectured at Bologna, was published by William Warren Vernon with the aid of James Lancia in 1887. Another noteworthy early commentator is Francesco da Buti who lectured at Pisa towards the close of the same century. Extracts from the early commentaries are given by G. Biagi in *La D. C. nella figurazione artistica e nel secolare commento* (Turin, 1921, etc.). The foundations for the establishment of an accurate text were laid by Carl Witte in his edition of 1862. The fullest 19th century commentary, that of G. A. Scartazzini, is now somewhat out of date. Among the best of more recent editions, with notes or commentaries, are those of F. Torraca, of T. Casini, revised and amplified by S. A. Barbi, and of Isidoro del Lungo. An excellent pocket edition of the text alone with a critical introduction, is that of Marco Cassioli (Bologna, 1923). For English readers, the three volumes in the Temple Classics, with text, translation and commentaries by H. Oelsner, T. Okey, and P. H. Wicksteed, are very useful, as also the *Readings in the Inferno, Purgatorio and Paradiso* of William Warren Vernon.

Editions of the Minor Works. The *Vita Nuova* was first printed at Florence in 1576, the *Convivio* at Florence in 1490. The *De Vulgari Eloquentia* was first published in Trissino's Italian translation at Vicenza in 1529, and in the original Latin, from a ms now preserved at Grenoble, in Paris in 1577, the *Monarchia* at Basle in 1599. There are critical editions of the *Vita Nuova* by M. Barbi (Florence, 1907), of the *De Vulgari Eloquentia* by Pio Rajna (1896), of the *Ecológica* by P. H. Wicksteed (*Dante and Giovanni del Virgilio*, 1902) and G. Albini (Florence, 1903), of the *Letters* with translation and commentary by Paget Toynbee (1920). The *Consensore* or *Rime*, were first adequately edited, the genuine pieces separated from the doubtful and spurious, by Michele Barbi in the *testo critico* of the Società Danteica Italiana (1921).

English Translations. The entire *Divina Commedia* appeared first in English in the version of Henry Bore (1802), and was followed by the admirable blank verse rendering of H. F. Cary (1814, 2nd ed., 1819), which has remained the standard translation. Of the numerous later translations may be mentioned those of Longfellow, of J. A. Carlyle (*Inferno* only), C. E. Norton and H. F. Torer in prose, G. Musgrave of the *Inferno* in Spenserian stanzas, C. L. Shadwell, of the *Purgatorio* and *Paradiso* in the metre of Marvell's "Ode to Cromwell", Hasel-foot and M. B. Anderson in *terza rima*. D. G. Rossetti's translation of the *Vita Nuova* will always hold its place as a thing of beauty. Translations of the *Vita Nuova* by T. Olney, of the *Rime*, *Convivio*, *Monarchia*, *Letters*, *Ecológica*, *Questio de Aqua et Terra*, by P. H. Wicksteed and of the *De Vulgari Eloquentia* by A. G. I. Howell are published in the Temple Classics, with full explanatory notes. See, in general, P. Toynbee, *Dante in English Literature* from Chaucer to Cary (1909), and Britain's *Tribute to Dante in Literature and Art* 1380-1920 (1921).

Acts and Studies. It is only possible here to mention a few works useful to English readers. As general introduction, P. Toynbee, *Dante Alighieri, his Life and Works* (4th ed., 1910), E. G. Gardner *Dante* (1923), M. Zingarelli, *Vita di Dante in compendio* (Milan, 1905) and his larger *Dante* (1903). Among critical studies, or elucidations of particular aspects of Dante's work, E. Moore, *Studies in Dante* (four series, 1896-1917), P. Toynbee, *Dante Studies and Researches* (1902), *Dante Studies* (1921), P. H. Wicksteed, *Dante and Aquinas* (1913), *From Vita Nuova to Paradiso* (1921), the volumes of *Dante studies* by L. D'Ovidio, now reprinting in the collected edition of his works. F. Torraca, *Studi danteschi* (1912) and *Nuovi Studi danteschi* (1921), E. G. Parodi, *Poesia e storia nella Divina Commedia* (1921), B. Croce, *La Poetica di Dante* (1921, Eng. trans. by D. Anselmi), C. Ricci, *L'ultimo rifugio di Dante* (new ed., 1921), F. Ercole, *Il pensiero politico di Dante* (Milan, 1928). Copious bibliographical indications on disputed points are given in the latest edition of the *D. C.* with the commentary of Casini and S. A. Barbi (Florence, 1926). The *Giornale Dantesco* and the *Studi Danteschi* directed by M. Barbi are important periodical publications dealing with every aspect of the subject.

Portraits of Dante. It is now generally agreed that the repainted figure of Dante in the fresco of the pedestal of the Baptistery in Florence is authentic and by Giotto, probably painted (c. 1334) from a sketch taken in the poet's early life. The Torrigiani mask, now in the same chapel, long supposed to have been made from a death-mask, is probably a work of the 15th or 16th century. It is possible that the later representations of Dante may have been influenced by the portrait by Taddeo Gaddi in Santa Croce (destroyed in 1506). Noticeable among these are the miniature in codex 1040 of the Biblioteca Riccardiana (c. 1436), the fresco transferred to canvas of Andrea del Castagno in Sta. Apollonia (c. 1450) the symbolical picture by Domenico di Michelino (1465) in the duomo at Florence the bronze bust at Naples (late 15th century), the recently discovered panel attributed to "Amico di Sandro". In the 16th century, we have the figure of Dante in Luca Signorelli's fresco at Orvieto, and in Raphael's "Parnassus" and "Disputa" in the Vatican. A famous signed sketch of Dante by Raphael is in the Albertina at Vienna. See R. T. Holbrook, *Portraits of Dante from Giotto to Raphael* (1911). Attempts have frequently been made to discover the portrait of Dante in various 14th century frescoes, and there have been recent "discoveries" of this kind at Assisi and elsewhere, the only one that is in the least plausible is that in Orcagna's "Paradise" in Santa Maria Novella at Florence (E. G. G.).

DANTON, GEORGES JACQUES (1759-1794), French revolutionary leader, was born at Arcis sur Aube on Oct. 26, 1759. He belonged to a respectable family of Champagne, his father, who died in 1762, was an attorney at the local tribunal, his maternal grandfather the roads and bridges contractor of the province. His mother neglected his upbringing, and the boy was allowed to run wild beside the Seine, finding vent for his animal spirits in rustic games, in wood and field, in wrestling with the beasts on the farm and in defying his schoolmistress, who tried to tame him with the whip. At the age of 14, after a short term at the small seminary at Troyes, this wild young ruffian, with pock-marked face, was entered at the *Oratoriens* to finish his studies. He won the prize for mythology, *accessits* for rhetoric and Latin verse, and for French essay. His imagination was fired

by republican Rome, and this appeal to the essential part of his nature, was strengthened from day to day by his assiduous study of the ancient historians and moralists.

Deciding to study law he went to Paris in 1780, where, thanks to his confidence in himself, he was admitted to the chambers of Maître Jean Nicolas Vinot. The manifold sources of interest provided by the courts could not, however, entirely absorb him, and his passion for physical exercise found outlet in swimming, fencing and tennis. Once, in an interval between two cases, we find this high spirited clerk plunging into the Seine and hurling "ungry imprecations" against the towers of the Bastille as the symbol of oppression. Back at his lodgings he greedily read the *Encyclopédie*, the writings of Montesquieu and Voltaire, of Rousseau and Buffon, and Beccaria's *Trattato dei delitti e delle pene*, which, as early as 1764, heralded a revolution in European criminal law. As a probationer advocate in the *parlement*, Danton was engaged in pleading, in a case in which a shepherd was in dispute with his overlord, he asserted his love of equality, and obtained the approval of Linguet.

His marriage with Angelique Charpentier forced him to settle down—or to appear to do so. In 1787, therefore, he became advocate in the *conseils du roi*. This required him to take an oath "to observe and keep strictly the laws and ordinances of the kingdom" and also to deliver a speech in Latin on his admittance. He paid a high price for this post, but it gave him a thorough insight into public law and administration, civil and ecclesiastical affairs, commerce and finance, the whole machinery of monarchy, the intricacies of customary law, and the law of corporations and property. He was elected to the Masonic lodge of the *Neuf Soeurs*, to which Franklin and Voltaire had belonged, and there met Bailly, Desmoulins, Condorcet, Chamfort and Sieyès. He continued his studies, and it should be noted that he read and spoke fluently Italian and English, he had read, in the original, Pope, Shakespeare and Adam Smith's *Wealth of Nations*.

We may picture him at this time—a broad face with strong features, sharply curved mouth and brilliant eyes, blazing with inward fire and passion.

At the outbreak of the Revolution (1789) Danton belonged to Cordeliers district, his house was exactly where his statue stands to day. He was as impetuous as he always had been from childhood in Champagne. As captain of the civic guard he attempted, on the night of July 15, to force the gates of the Bastille that he had before defied. He was already taking sides against both the supporters of the old regime and the moderates. He opposed Lafayette, elected to the States General by the nobility of Auvergne, who, after July 14, became chief of the National Guard, but who, on Oct. 5 and 6, defended the royal family. He went further than Bailly, the learned mayor of Paris. Danton's position is clear from the time of the events of October, when the king and the assembly, the only two lawful authorities, became prisoners of the people, when Louis XVI had to leave Versailles and return to the Tuileries, escorted by a hunger-maddened mob. It was Danton who had the tocsin rung, and Danton who was charged by the general assembly of the Cordeliers to thank the king for having graciously taken up his residence in *sa bonne ville*. Although on Aug. 13, 1793, he was to affirm before the Convention that "the republic had existed in all men's minds 20 years before its proclamation," he, at this time, professed himself a good Royalist. His record at the *Palais Royal*, and even more at the Cordeliers, shows him quick in conciliating and incapable of refusing popular favour. At each re-election to the presidency of the district, the assembly "accompanies its unanimous vote with an outburst of enthusiasm." Persuasion and force of character made him, the popular tribune, dominant. "Danton, the president of the Cordeliers," writes Taine, "could secure in his district the arrest of any one he pleased. His violence in speech and counsel made him, in the absence of wider opportunities the ruler of his quarter."

After the fall of the Bastille, the commune of Paris displaced the former council and took up its quarters at the hotel de ville. This municipal organization was to play an important part in the Revolution. By the decree of May 21, 1790, it was divided into

The river can be divided into three sections, the upper course, above Bratislava, the middle course, between Bratislava and the Iron Gates and the lower course, below the Iron Gates.

The direction of the river in its upper course is determined by the structure of the Alpine foreland. Rising in the crystalline rocks of the Black Forest it flows eastward across a narrow belt of Jurassic rocks to Sigmaringen and from thence to Regensburg along the northern edge of the Swiss plateau (see ALPS), its bed being in the soft Molasse (Upper Oligocene and Miocene rocks) and its direction following the so called Danube Fault, which passes from Schaffhausen to Regensburg. Below the latter town the river is deflected south eastward by the Bohemian massif and flows in part upon the crystalline rocks of the latter and in part upon the Molasse, but at Krems it turns eastward across the Molasse and after passing Vienna it flows through the gap which separates the eastern Alps from the Carpathians. The valley of the Danube above Sigmaringen is narrow, the scenery being wild and beautiful, especially above Tuttingen, where castles crown every possible summit on the neighbouring hills. Below Immenndingen much water escapes by subterranean fissures into the river Ach, a tributary of the Rhine. After it is joined on the right bank by the Iller, which tributary rises in the Allgauer Alps, the Danube attains a width of 78 yd and an average depth of 3 ft 6 in and becomes navigable downstream for specially constructed craft of 100 tons. At Donauehring (height 1,330 ft) it receives the Lech, which tributary rises near the Iller and flows in a direction parallel to it, whilst at Regensburg (height 949 ft) the Danube receives on the left bank the river Naab which rises in the Fichtel Gebirge. Below Regensburg, at Deggendorf, it is joined by the Isar, on the banks of which stands Munich. The upper course of the Danube lies in German territory, rising in Baden and flowing through Württemberg and Bavaria. At Passau (height 800 ft) it enters Austria and approximately 100 m of the north western boundary of that country is formed by the Danube, its right bank tributary the Inn, and the Salzach which flows into the Inn on its right bank. The rivers Isar, Inn and Salzach drain a large portion of the eastern Alps and have many important towns on their banks. The Inn joins the Danube at Passau.

GREIN WHIRLPOOL

From Passau to Linz the Danube is hemmed in by mountains, but its valley becomes wider below the latter town where the river subdivides into several arms which unite again at the once famous whirlpool near Grein. Below Grein, the river flows through another narrow defile as far as Krems but once more subdivides as it passes toward Vienna. The district between Linz and Vienna is renowned for its beauty and for the numerous places of historical and archaeological interest along the river's banks. At Vienna the river is 316 yd wide, and 429 ft above sea level and below the town is the district of Marchfeld which is a low lying country across which the Danube frequently subdivides forming numerous islands. An important left bank tributary, the March, which drains Moravia, joins the main stream here. Before reaching Bratislava (Pozsony, Pressburg), the Danube passes through the narrow gap between the lower spurs of the Alps and the Carpathians and enters upon the middle section of the river. At this gap the river also passes out of Austria and for a few miles is entirely in Czechoslovakia but it very soon becomes the boundary between that country and Hungary, until it reaches Estergom (Gran), below which town it enters Hungary.

The Danube flows for the first 100 m of its middle course upon alluvial and Quaternary deposits of the Little Hungarian Plain. This latter is separated from the Great Hungarian Plain by the Bakony Wald ridge, the innermost arc of the Carpathian mountain system, and the Danube breaks through this ridge at Estergom. After leaving Bratislava, the river divides into three channels forming several islands but these join together again at Komárom where the river is also joined on its left bank by the river Waag which rises in the Carpathians. Higher up the stream at Gyor (Rabab) the outer branch of the divided Danube is joined by the river Ráb which rises in the Styrian Alps. Between Estergom and Waidon (Vác) the valley becomes narrow until

at the latter town the river turns southward to flow in that direction for 230 m across the great Hungarian plain. In this long stretch, the Danube meanders about in a wide alluvium filled valley, frequently dividing into two or more streams and passing Budapest, Buda (where it leaves Hungary and enters Yugoslavia) and Mohács. At Almas, 14 m east of Osijek, the Danube is joined by the important right bank tributary, the Drava (height 81 ft), which rises in Tirol and drains a large portion of the Eastern Alps. The Danube is again diverted eastward at Borovo by the Fruška Gora, and it flows along the northern edge of this range, passing Novi Sad (Újvidék), until it reaches Belgrade. Between these two towns, the Danube receives the important left bank affluent, the Tisa (Theiss), which, rising in the Carpathians, drains the greater part of the western slopes of those mountains, as well as the great Hungarian plain. At Belgrade, the Danube is joined by the important right bank affluent, the Save, which, rising in the Julian Alps, flows eastward and drains the greater part of western Yugoslavia, whilst the eastern part of that country is drained by the Morava, which joins the Danube between Belgrade and Bazias, also on its right bank.

The whole character of the Danube valley changes suddenly at Bazias, and between that town and Turnu Severin, the river has worn out for itself a channel through the mountain ridge which joins the Carpathian arc with the Balkan mountains. A large part of the great Hungarian plain, which covers an area of about 30,000 sq m, is remarkably flat and low-lying, and the altitude rarely exceeds 300 ft. In consequence, natural drainage by the Tisa and the Danube is very poor, and where artificial drainage has not been carried out, the banks of the rivers are in many places lined by wide swamps and marshes, which in winter form large ice-fields. Until comparatively recent geological times, this plain formed an extensive inland sea, whose final effluent followed the present course of the Danube through the Kazan defile and the Iron Gates. By the lowering of its channel through the gap (the level of the Danube at Orsova is now 42 ft above sea level), this epicontinental sea was drained, leaving the great Hungarian plain covered with a thick deposit of alluvial sands and gravels. Hemmed in by precipitous rocks, the river passes through the stupendous Kazan defile (162 yd wide), then widens out to nearly a mile at Orsova, but becomes narrower again at the Iron Gates. The river has been cleared of numerous obstructions to make possible navigation along this stretch.

THE LOWER COURSE

The lower course of the Danube stretches from the Iron Gates to the Black Sea. From Bazias to the junction with the small right bank tributary, the Timok, the Danube forms the boundary between Yugoslavia and Rumania. From the Timok to a point 27 m east of Ruschuk, it forms the boundary between Rumania and Bulgaria, after which it flows entirely through Rumanian territory. Along its lower course, the Danube flows over Quaternary deposits covered by river sands and gravels. Its north bank is low, flat and marshy with numerous small lakes, but its south bank is crowned by low heights which make excellent town sites, e.g., Vidin, Lom, Palanka, Svishtov, Ruschuk and Silistra. At Ruschuk, the railway from Bucharest to Varna, crosses the Danube. The river receives many tributaries along this stretch, those on its left bank, of which the Oltul and Dambovit, on which stands Bucharest, are the most important, draining the Transylvanian Alps, and those on its right bank, draining the northern ridges of the Balkan mountains. At Cernavoda, where the river is crossed by the railway from Bucharest to Constanta, the Black Sea port, the Danube is diverted northward by the hills of Dobruja, which form an isolated remnant of the Hercynian foreland of Europe. Along this stretch as far as Braila, the river subdivides into several channels and spreads out over the surrounding country forming numerous lakes. The river changes its direction again at Galatz, the chief port on the delta of the Danube, and flows eastward toward its mouth. Sea going vessels having a register up to 4,000 tons can when the river is far at Braila, but those up to 600 tons can sail as far as Turnu Severin. Two left bank affluents, the Siret and the Prut, which drain the eastern side of the Carpathian

mountains, enter the river near Galatz. For 30 m in an easterly direction from Galatz, the Danube flows as a single channel until it breaks up into the several branches of its delta. Along the northern shore of the river from Galatz to the sea there is a large number of shallow lakes, which indicates the poor drainage of the region. The most important mouths of the river are, reading from north to south, the Kilia, Sulina and St. George, and in 1905 the ratio of the discharge of these three branches was Sulina 9%, St. George 24%, and Kilia 67%. The mean annual outflow of all the mouths is estimated at 315,300 cu ft per sec, and the amount of silt brought down at 108 million tons per year. As the currents of the Black sea along this coast flow from north to south, the silt brought down by the Kilia branch tends to block up the mouths of the other channels.

The delta of the Danube, which is about 1,000 sq m in area, is a mere wilderness of swamps and marshes covered by tall reeds and through which the silt laden distributaries of the river slowly meander. The monotony of this waste of country is relieved here and there by isolated elevations covered by oak, beech and willows, many of them marking ancient coast lines. The most important towns in the delta region are Ismail, Chilia and Vilkof on the Kilia branch, Sulina at the mouth of the Sulina branch and Tulcea and St. George on the St. George's branch. The Kilia branch itself breaks up into a wide delta which is continually advancing seaward, and it is estimated that its various mouths pour into the sea 3,000 cu ft of sediment per minute. The Sulina branch breaks off from the Tulcea (St. George's) branch, 7 m below the town of Tulcea, and the St. George's branch again subdivides before entering the sea.

Before engineering works were commenced to make the channels navigable, ships drawing only 8 ft of water experienced great difficulty in entering, for the depth of water in few portions of the channels rarely exceeded this figure and the frequent occurrence of numerous sand banks and bars further added to the difficulty of shipping. To-day, ships drawing 22 ft of water can reach Braila.

Traffic—The Danube may be divided for traffic purposes into the maritime Danube from the sea to above Braila, and the fluvial Danube from this point up to Regensburg, where the river at present ceases to be navigable for large craft. Braila and Galatz, situated respectively 171 and 150 kilometres from Sulina (at the mouth of the river), are the usual points for transhipment between seagoing vessels and barges. Besides transhipping goods on to barges, seagoing vessels also tranship on to railways at Braila and Galatz. Traffic has never equalled that on the Rhine, where the countries are much more highly developed industrially.

The European Commission—The administration of the Danube was formerly controlled by the single European commission of the Danube, an institution set up with a provisional character by the Treaty of Paris in 1856. Its headquarters were at Galatz, and it administered the Danubian delta only, eight interested nations being represented on it. The conservancy of the other Danubian reach of international importance—the Iron Gates—was entrusted to Austria-Hungary, and assigned by her to Hungary.

In the Treaty of Bucharest (May 1918) the Central Powers reduced the membership of the European commission to "states situated on the Danube or the European coasts of the Black sea." The Treaty of Versailles (June 1919) reinstated the commission in "the powers it possessed before the war." It went on that "as a provisional measure, only representatives of Great Britain, France, Italy and Rumania shall constitute this commission." The commission acquired definite character when the Danube statute was signed in Paris on July 23, 1921. In future, subject to the unanimous consent of the states represented on the commission, any European state which is able to prove its possession of sufficient maritime commercial and European interests at the mouths of the Danube may be represented on it. Up to 1926, however, the representation had not been increased.

The International Commission—The Treaty of Versailles, Art. 347, provided that "from the point where the competence

of the European commission ceases," i.e., from above Braila, "the Danube system referred to in Art. 331, *et seq.*, as far as the highest navigable point at Ulm, shall be placed under the administration of an international commission composed as follows—

Two representatives of German riparian States

One representative of each other riparian State

One representative of each non-riparian State represented in the future as the European commission of the Danube."

This commission was to carry on the administration provisionally until the conclusion of a definite statute concerning the Danube.

On July 23, 1921, this statute was signed. Many of its provisions simply followed the lines of the "convention on the regime of navigable waterways of international concern" concluded at Barcelona on April 20, 1921. Article 1 declared navigation on the Danube system to be unrestricted and open to all flags, on a footing of complete equality, from Ulm to the Black sea, and the internationalised portions of the Danube tributaries were defined. The provisional composition of the international commission was confirmed. It had to see that the declaration in Art. 1 was not infringed by any riparian State or States, to draw up a programme of public works for the improvement of the waterway on the basis of proposals submitted by the riparians, controlling and if necessary modifying the annual programmes of the riparian states for current works of maintenance. The cost of such works was borne by the riparian State concerned, assisted, if the commission so decided, by other States interested.

The cost of works of improvement (not maintenance) might be covered by navigation dues, to be imposed (with the commission's authorisation) by the riparian State which had executed the works, or by the commission itself, if it had executed them at its own charges. Dues were to be assessed on the ship's tonnage and not based on the goods transported, revenue from them was to be applied exclusively to the works for which they were imposed, there was to be no differential treatment of flags. Customs duties levied by a riparian on goods loaded or discharged at the Danubian ports in its territory were also to be levied without distinction of flag or hindrance to navigation, and were not to be higher than duties levied at other frontiers of the same state. The transport of goods and passengers, even between ports of the same riparian State, was to be unrestricted and open to all flags on a footing of perfect equality, with the exception of regular local services which may only be carried out by foreign craft subject to the observance of the national law of the local sovereign, and in agreement with the authorities of the riparian state concerned (Art. 22). Passage of goods and passengers in transit was to be free. Uniform police regulations were to be drawn up and applied by each riparian on its own territory. A special joint service of Rumania and Yugoslavia, organised with the approval of the commission, will have to take over the maintenance and improvement of the Iron Gates section, with headquarters at Orsova. The commission was to decide on special works to be undertaken (and dues to be levied for the purpose) and to have power to abolish the service when its work was done, it could inaugurate like services elsewhere if necessary.

The commission was to determine its own procedure and administer its own budget, the presidency being held for six months by each delegation in turn. Its seat was to be at Bratislava the first five years, and thereafter it might be established at other towns on the Danube, selected at its discretion, for five-year periods in rotation. Its property and members were to enjoy diplomatic privileges and it was to fly its own flag. It was to deal in the first instance with questions regarding the interpretation and application of the convention, but the special jurisdiction set up by the League of Nations would ultimately have to deal with complaints from a state that the commission was acting *ultra vires*, or from the commission against a state for neglecting to carry out its decisions. Every effort was made to insure uniformity between the working of the International and the European commissions, and between different signatory states.

The convention came into force on June 30, 1922. One of the

most important questions that has been raised since that date was connected with the interpretation of article 23 (above) since certain states in eastern Europe were in venous to reserve to their own flag the passenger and goods traffic between ports in their own territory. In the discussion on article 2, the Rumanian delegate stated that the carriage of goods on river craft between two ports in the same country did not constitute cabotage if the goods were subsequently transhipped to a seagoing vessel to export, and that article 23 imposed no restriction on the traffic carried on up to that time by Greece.

The principle of freedom of navigation of the Danube for all nations was recognized following World War II but in practice it was controlled and monopolized by the USSR and its Balkan satellites.

The old Ludwigskanal connecting the Danube and the river Main was enlarged to form the Rhine-Main Danube canal, thus making navigation between the Atlantic ocean and the Black sea through the European continent possible.

Many legends are woven around the course of the Danube. A distinct link between Austria near Graz is still called the Nibelungen ring in memory of one of the most famous myths.

DANVERS, a town of Essex county Mass., 25 mi N.E. of Boston inland with a river port. It is served by the Boston and Maine railroad. The population was 15,720 in 1950. It is a residential suburb with manufacturing industries including electrical products, and is the seat of a state hospital for the insane.

A part of what is now Danvers is included in the grant made by the court of assistants to Gov. John Endecott and Rev. Samuel Skellon of the Salem church in 1632. Danvers was set off from Salem as a district in 1752 and was incorporated as a township in 1757, but the act of incorporation was disallowed in 1759 by the privy council on the recommendation of the board of trade, in view of George II's disapproval of the incorporation of new townships at that time. This explained the significance of the words on the seal of Danvers, "The King Unwilling." In 1775 the district was again incorporated. Salem village which was within the limits of modern Danvers, was the centre of the famous witchcraft delusion in 1692.

In 1835 South Danvers was set off as a separate township, and in 1868 was named Peabody (qv) in honour of George Peabody, who was born and buried there. In 1857 part of Beverly was annexed to Danvers. Among natives of Danvers were Samuel Holton (1738-1816), a member (1778-1780 and 1782-1787) of the Continental Congress and (1793-1795) of the Federal Congress, Ichabud Putnam, Moses Porter (1755-1822), who served through the War of Independence and the War of 1812, and Grenville Melton Dodge (1831-1916), a railway engineer, who fought in the union army in the Civil War, reaching the rank of major general of volunteers, and was a Republican member of the national house of representatives, 1867-1869, and in 1898 president of the commission which investigated the management of the war with Spain.

See J. W. Hanson, *History of the Town of Danvers* (1848), and A. P. White, "History of Danvers" in *History of Essex County* (1888).

DANVILLE, a city of eastern Illinois, U.S., 124 mi S of Chicago, on the bluffs of the Vermilion river, the county seat of Vermilion county. It is served by the Chicago and Eastern Illinois, the Illinois Traction (electric), the New York Central and the Wabash railways. Pop. (1950) 37,864, (1910) 36,919.

Danville is the commercial centre of a rich farming and coal

mining region and has substantial manufacturing industries, including railroad locomotive and repair shops, lumber mills, foundries, large brick plants and a zinc mill.

The bank clearings in 1949 were \$68,375,989.78. The assessed valuation of property in 1949 was \$72,692,663. There are large dairy and stock farms round about. At the western boundary of the city is Lake Vermilion, a reservoir 8 mi long with a capacity of 2,500,000,000 gal. completed in 1925. A branch of the National Home for Disabled Volunteer Soldiers was established there in 1895. The National Soldiers home for veterans of the U.S. has been converted into a neuropsychiatric unit of the Veterans administration. About 1,800 patients are cared for. Danville is the site of an Indian village, Pinkeshaw, the centre of many trails. In 1824 Dan Beckwith, for whom the city was named, built his trading cabin there, and in 1826 the settlement became the county seat. It was incorporated as a city in 1869. A commission form of government was adopted in 1927.

See C. C. Burford, *The History and Romance of Danville Junction* (1934).

DANVILLE, a city in the bluegrass region of Kentucky, U.S., 75 mi S.E. of Louisville, the county seat of Boyle county. It is a division centre of the Southern railway. The population was 8,686 in 1950 and 6,734 in 1940 by the federal census. The city of Danville is an important market for tobacco, horses, cattle, hogs and sheep, is the trading centre for a large area, and has a clothing factory, shoe factory, gas-fired water heater factory, chair manufacturing plants and railroad shops. It is the seat of the Kentucky Deaf institute (founded 1823), the first state institution of the kind in the U.S., and Centre college (Presbyterian, chartered 1819). There are many fine old mansions in and near the city, and beautiful landscapes and river scenery in every direction. Herrington lake, created by the hydroelectric development on the Dix river, has 75 mi of shore line. The battlefield of Perryville is 11 mi west. At Pleasant Hill, 13 mi N., are the massive stone buildings of an abandoned Shaker community. Danville was on the Wilderness road, and was one of the first settlements (1781) in Kentucky. It was the home of Ephraim McDowell (1771-1830), who in 1809 performed the first entirely successful operation for ovarian tumour, and was the birthplace of Justice John M. Harlan. From 1786 to 1790 an influential "political club" held long winter evening debates in the Gill tavern, and there met the nine conventions which discussed the terms of separation from Virginia and framed the first state constitution.

DANVILLE, a borough of Montour county, Pa., U.S., on the high northern bank of the Susquehanna river, at the base of Montour ridge, 110 mi N.W. of Philadelphia, the county seat and an active manufacturing centre. It is on federal highway 11, and is served by the Lackawanna, the Pennsylvania and the Reading railways. The population was 6,994 in 1950 and 7,122 in 1940 by the federal census.

It is in the centre of a rich agricultural region and has varied industries, including medicinal drugs, cement machinery and coal pulverizing and stone crushing equipment. An outstanding mental hospital, the Danville state hospital (established 1868), is located there, as well as the George F. Geisinger Memorial Hospital and Clinic, a noted general hospital, and the first Catholic Slovak Girls' academy in the U.S. Settlement was made there about 1776, and in 1793 a town was laid out, called Dan's Town after Gen. Daniel Montgomery, the founder. One was discovered on Montour ridge and the town as an iron centre grew rapidly. It was incorporated in 1849. The first "T" rail in the United States was rolled there in 1845.

DANVILLE, a city in Pittsylvania county of Virginia, U.S., is located on the Dan river in southern Virginia, the heart of the famous Piedmont section. It is on federal highways 29, 53 and 360 and is served by the Southern, the Atlantic and Danville and the Danville and Western railways, by Eastern Airlines and bus and truck lines. Pop. (1950) 35,066, (1940) 37,479.

Danville is the home of a large single-unit textile mill, an important auction market for flue-cured bright leaf tobacco and a trade centre for the large agricultural area around it. Other

industries include the manufacture of knit goods, elevators, paints, rayon fabrics, fertilizers, millwork, meat and food products, bakery goods and many other diversified products. Danville Technical Institute, Virginia Polytechnic Institute extension, Averett college and Stratford college are located there.

In 1865 Danville was made the capital of the Confederacy when Pres. Jefferson Davis established his headquarters there for a few days. Established as a town by the Virginia legislature in 1793, Danville was incorporated in 1830 and became an incorporated city in 1890.

In 1950, under a state optional enabling act adopted by vote of the people, Danville established the council-manager form of government. Utilities owned and operated by the city included an auditorium, water works, electric generation and distribution and gas manufacturing and distribution.

See J. R. Meade, *I Live in Virginia* (1935).

DANZIG, in Polish GDAŃSK, a Baltic port and town close to the mouth of the river Vistula, belonging to Poland. From 1919 until Sept. 1, 1939, the town was the centre of the autonomous territory or Free City of Danzig (*Freie Stadt Danzig*) established by the treaty of Versailles. To the north Danzig is bordered by the gulf of Danzig and protected against heavy seas by the peninsula of Hel. It is connected with the sea by two artificial arms of the Vistula, dredged to a depth of 15 ft to allow larger ships to approach the inner wharves, for a distance of 4 mi. the harbour canal is navigable for ships with a draught of 30 ft. Until 1945 Danzig had largely preserved its picturesque mediaeval scenery,

MAP SHOWING BOUNDARIES OF THE FREE CITY OF DANZIG AS ESTABLISHED BY THE TREATY OF VERSAILLES 1919. THE STATE WHICH WAS A BOUNDARY LINE OF 147 MI. WAS UNDER THE PROTECTION OF THE LEAGUE OF NATIONS UNTIL 1939.

its narrow streets with gabled houses and carved stone balconies and its old churches, gates and towers, the most famous of which is the late mediaeval Marienkirche high above the town. In March 1945, however, Danzig suffered from Russian artillery.

History—Danzig is first mentioned as Gdaniac, in the 11th century. It was included in the 10th century by the duke of Pomerania. Later it was included under the rule of Pope Eugenius III (1145), in which it is called Kdanze, in the Polish diocese of Włocławek. Just before this, however, the Polish king's governor of eastern Pomerania had taken the title of *dux Pomoranus* and founded a dynasty with his seat at Danzig. These dukes built a castle and a church there, and under them the Cistercian abbey of Oliwa was founded, which began the settlement of peasants and the drying of the lowlands in the Vistula estuary. With the eastward extension of the shipping and trade of Lubek, a market of German merchants developed and thus, c. 1225, led to the foundation of the city of Danzig which in 1263 received Lubek law (see HANSEATIC LEAGUE). By the late 13th century Danzig was an important link in the chain of Hanseatic towns which carried on the trade between eastern and western Europe. Its trade connections stretched from Novgorod to Flanders and England and its position at the mouth of the Vistula made it the natural outlet for the export trade of its vast hinter-

land then entering into relations with the west through the quick progress of colonization. The last Polish duke of Pomerania, Mestwin II, died without issue in 1294 and bequeathed his duchy to his cousin Przemysł II, duke of Great Poland. But in 1295 the Teutonic Knights already established in Old Prussia east of the Vistula invaded Pomerania and on Nov. 14 seized Danzig and put its Polish inhabitants to the sword. Danzig, however, continued to flourish. In the 14th century its population rose to about 10,000, and its trade developed apace. As the leading town of the Teutonic state of Prussia it played an important part in the councils of the Hanseatic league. Its inhabitants were Germans or Germanized Slavs with some immigrants from England, Scandinavia, Poland, Bohemia, Hungary and Flanders, the Flemings bringing their separate *placita Flammensis*. Many immigrants were granted full citizen rights and the English community had its own governor and privileges. Danzig became the main entrepot in the east for imported cloth and corn and timber exports of the eastern Baltic.

The kings of Poland, however, never renounced their rights to Pomerania. Władysław II Jagiello, calling himself *Pomoranus dominus et haerens*, defeated the Teutonic Knights at Grunwald in 1410 but failed to secure Pomerania and Danzig. In 1454 the nobility and towns of Pomerania applied to Poland for help against the Teutonic Knights and offered their submission to the Polish crown. The new war between Poland and the Teutonic Order which broke out in consequence of this revolt lasted 17 years, largely kept up by the great wealth and sea power of Danzig, which succeeded in withstanding sieges and in defeating enemy fleets. In 1466, by the treaty of Toruń (Thorn), the Teutonic Order restored Pomerania and Danzig to Poland. As a reward for its loyal services Casimir IV Jagiello granted the city far-reaching autonomy. As it became the main port of Poland, then a great power, Danzig rapidly attained a position of great prosperity. In the late 16th century half of the entire traffic through the sound had Danzig as its destination, but by then the large majority of the ships belonged to Amsterdam and other western towns, and often fewer than 100 Danzig ships passed through the sound.

Danzig was strongly affected by the Reformation. In 1525 the lower orders overthrew the aristocratic town council and established a popular government which abolished Catholic worship and dissolved the monasteries. The deposed authorities appealed to the king of Poland, who by force restored Catholicism and aristocratic government. Yet the Reformation advanced quietly and was firmly established by 1540, though the aristocratic council remained in power.

In the early 17th century Danzig probably had 40,000 to 50,000 inhabitants, and its corn exports amounted to considerably more than 200,000 tons yearly as compared with about 120,000 in the late 16th century and about 25,000 tons in the late 15th century. The Polish squire sold his produce there and bought western luxury goods and the paintings, engravings and other products of the native artisans. Danzig's links with Poland, however, were cut by the first partition of 1772. It became surrounded by Prussian territory, and Prussians customs formed a barrier to all traffic in the Vistula. At the second partition (1793) Danzig became a Prussian town and the capital of the province of West Prussia. In 1807 Danzig was taken by Napoleon's general Pierre François Joseph Leclercq, who next year was given the title of duke of Danzig. Napoleon made Danzig a free city, with a Franco-Polish garrison, but after his defeat the city was restored to Prussia. The wars and sieges of the period and the continental blockade had gravely impaired the city's wealth, and the English corn laws caused a further decline of its trade. Although its recovery was furthered by Prussian efforts, the town cut off from its natural hinterland became an administrative and provincial centre and a garrison town and ceased to be the great emporium of the Baltic trade, the relative importance of which also declined sharply. Some industrialization, especially shipbuilding, provided a measure of compensation for lost greatness.

The treaty of Versailles restored eastern Pomerania to Poland as the "Polish Corridor" separating East Prussia from Germany proper. The Allied powers recognized Poland's right of access to

the sea but hesitated to give it Danzig, an almost purely German city. Accordingly Danzig was separated from Germany early in 1920, occupied by British troops (which stayed until November) and made a free city under the protection of the League of Nations, with a territory of about 710 sq mi. and about 360,000 inhabitants. A high commissioner, appointed by the League, was to reside at Danzig and to deal in the first instance with all differences between Poland and Danzig. The free city was included within the Polish customs frontiers, Poland was granted the free use of all waterways, docks, etc., the control and administration of the Vistula and of all railways in Danzig, with the right to develop and improve them, and authority to conduct the foreign relations of Danzig (articles 102-104 of the peace treaty). The customs were administered by Danzig itself. It also appointed its own officials and had its own currency and postal services, but the port was administered by a mixed harbour and waterways board. In the elections to the constituent assembly, the Polish parties gained 72 out of 120 seats. The democratic constitution adopted was approved and guaranteed by the League. It corresponded to that of the Weimar republic, with a *Volksrat* elected by universal franchise, responsible to it was a city government or senate formed by the majority parties and headed by a *Senatspräsident*.

This complicated regime never worked satisfactorily because the free city's German government adhered to the general line of German policy toward Poland, seeking through permanent conflict to bring about a revision of the territorial settlement of Versailles. Unable, therefore, to rely on any good will from Danzig, the Poles decided to build a port of their own at Gdynia, 10 mi. to the north. Although Gdynia's trade developed quickly, Danzig continued to prosper economically every year from 1927 to 1931 the tonnage of ships arriving and the quantity of goods handled amounted to four times the totals of 1913. But by 1932 Gdynia's turnover was equal to Danzig's.

The prosperity of Danzig did not make the conflict of nationalities less bitter, nationalism having gained the upper hand over economic interests. This conflict was acerbated by the rise of the Nazi party. In May 1933, the nazis gained 39 seats in a *Volksrat* of 72 and accordingly formed the new city government. This attempted to nazify Danzig by unconstitutional means, against which the opposition parties appealed in vain to the League council. As a result of the council's inactivity the opposition parties were dissolved, their leaders imprisoned and freedom of the press abolished. By 1938 Danzig was completely *gleichgeschaltet* with a Nazi *Gauverwalter* as supreme authority, subordinate only to Hitler. Late in 1938 Hitler demanded the return of Danzig to Germany, but Poland refused. In 1939 Germany smuggled weapons and troops into Danzig, and at the outbreak of World War II Danzig was quickly occupied by German troops and reincorporated with Germany, again becoming the capital of the province of West Prussia. The League's last high commissioner, Professor Karl Burckhardt, was forced to leave. At the end of the war Danzig was given to Poland. German inhabitants who had not fled before the advancing soviet army were expelled and partially replaced by Poles. The population was 117,894 in 1946, but had risen to 193,500 by the end of 1950 (*cf.*, however, the prewar figure of 291,000).

Trade.—Danzig's port facilities suffered less from destruction in World War II than Gdynia's. In 1947 Danzig handled more than 16% of Poland's total exports (mainly minerals and coal) compared with Gdynia's 14%, and more than 28% of Poland's total imports compared with Gdynia's just less than 28%. The two ports were thus nearly equal, but as a fishing port Gdynia had nine times the turnover of Danzig. In 1947 both ports together handled 4,368 ships and 4,497,000 tons of shipping, that is, 90% of Poland's total for that year but less than one third of the prewar figures. In 1950, however, they together handled more than 10,000,000 tons, compared with 14,500,000 in 1938. They were treated as one administrative unit, with a combined port area of 1,260 ac.

1917); Casimír Smogorzewski, *Poland's Access to the Sea* (London, 1931); I. F. D. Morrow, *The Peace Settlement in the German Polish Borderlands* (Oxford, 1937).

DAPHNAE (Τάφνηες, mod. *Defenech*), an ancient fortress near the Syrian frontier of Egypt on the Pelusian arm of the Nile. Here King Psammethichus established a garrison of foreign mercenaries, mostly Carian and Ionian Greeks. After the destruction of Jerusalem by Nebuchadnezzar in 588 B.C., the Jewish fugitives, of whom Jeremiah was one, came to Taphnath. When Naucratis was given by Amasis II the monopoly of Greek traffic the Greeks were all removed from Daphnae, and the place never recovered its prosperity; in Herodotus' time the deserted remains of the docks and buildings were visible. The site was discovered by Sir Flinders Petrie in 1886, the name "Castle of the Jew's Daughter" seems to preserve the tradition of the Jewish refugees.

DAPHNE (Gr. laurel tree), in Greek mythology, was the daughter of the Arcadian river god Ladon, or the Thessalian Peneus, or of the Laconian Amyclas. She was beloved by Apollo, and when pursued by him was changed by her mother Ge into a laurel tree (Ovid, *Metam.*, 1, 452-567). In the Peloponnesian legends, another suitor of Daphne, Leucippus, son of Oenomaus of Pisa, disguised himself as a girl and joined her companions. His sex was discovered while bathing, and he was slain by the nymphs (Pausanias, viii, 20; Parthenius, *Erotica*, 15).

DAPHNE, a genus of much cultivated, showy, and sometimes evergreen, Eurasian shrubs, belonging to the family Thymelaeaceae, and containing about 40 species. *D. Laureola*, spurge laurel, a small, widely cultivated shrub with green flowers in the leaf axils towards the ends of the branches and ovoid black, very poisonous berries, is found in England. *D. Mezereum*, mezeorum, a rather larger shrub, 2 to 4 ft. high, has deciduous leaves, and bears fragrant pink flowers in clusters in the axils of last season's leaves, in early spring before the foliage. The bright red ovoid berries are cathartic, the whole plant is acrid and poisonous. It is a native of Europe and north Asia, and found apparently wild in copses and woods in Britain. It is a well known garden plant, and several other species of the genus are cultivated in the open air and as greenhouse plants. *D. Cneorum* (garland flower) is a hardy evergreen trailing shrub, with pink sweet-scented flowers. *D. odora* (China and Japan) is a hardy evergreen with showy, rosy purple, fragrant flowers. *D. indica* (China) and *D. japonica* (Japan) are greenhouse evergreens with respectively red or white and pinkish purple flowers.

DAPHNEPHORIA, a festival held every ninth year at Thebes in Boeotia in honour of Apollo Ismenius or Galaxius. It consisted of a procession in which the chief figure was a boy, of good family and noble appearance, whose father and mother must be alive. Immediately in front of the boy, who was called *Daphnephoros* ("laurel bearer"), walked one of his nearest relatives, carrying an olive branch hung with laurel and flowers and having on the upper end a bronze ball from which hung several smaller balls. Another smaller ball was placed on the middle of the branch or pole, which was then twined round with ribbons.

These balls were said to indicate the sun, stars and moon, while the ribbons referred to the days of the year, being 365 in number. Then followed a chorus of maidens carrying suppliant branches and singing a hymn to the god. The *Daphnephoros* dedicated a bronze tripod in the temple of Apollo. The festival is described by Ptolemy (in Photius, *Cod.*, 236).

DAPHNIS, the legendary hero of the shepherds of Sicily, and reputed inventor of bucolic poetry. According to his countryman Diodorus (iv, 84), and Aelian (*Var. Hist.*, x, 18), Daphnis was the son of Hermes and a Sicilian nymph, and was found by shepherds in a grove of laurels (whence his name). He won the affection of a nymph, who made him promise to love none but her, threatening that if he proved unfaithful he would lose his eyesight. He failed to keep his promise and was smitten with blindness. Daphnis, who endeavoured to console himself by playing the flute and singing shepherds' songs, soon afterwards died, or was taken up to heaven by his father Hermes, who caused a spring of water to gush out from the spot where his

on had been carried off. Ever afterwards, the Sicilians offered sacrifices at this spring. In Theocritus, *Id. I*, Daphnis' apparently has offended Eros and Aphrodite, and in return has been smitten with unrequited love, he dies, although Aphrodite, moved by compassion, endeavours, but too late, to save him.

See H. W. Stoll in Roscher's *Lexikon*, and G. Knaack in Pauly-Wissowa's *Realencyclopädie*.

DARAB (originally DARABGIRD), a town and district of the province of Fars in Iran. Its salt mines have for centuries been important, its bitumen deposits once were. In the middle ages its textiles were famous. Today it produces a great quantity of dates and the best tobacco in Iran. Darab town, 140 mi. S.E. of Shiraz formerly one of the most important in Fars, has a population of about 5,000. Persian legend recounts that it was founded by Darab, father of Darius III Codomanus (336-330 B.C.). It is surrounded by citrus groves and large date plantations. Nearby are the Qala-i Darab, or "Citadel of Darab," 3½ mi. S., a series of circular earthworks around an isolated rock, the history of which is unknown, and the great Sassanian rock reliefs of Naqsh-e Rostam, showing the investiture of Artaxerxes I (224-221), Shapur I (242-272) and his followers, and the triumph of Shapur in 260 over the Roman emperor Valerian.

D'ARANYI, JELLY (1895-), Hungarian violinist, grand niece of Dr. Joachim and one of the most brilliant players of her day, was born at Budapest on May 3, 1895. She studied under Hubay and quickly attracted notice by her exceptional powers, eventually winning world-wide recognition. She resides in London. Her sister, Madame Adila Fachin, also a violinist, is likewise a player of the first rank.

DARAS, a fortified Roman city on the Mesopotamian frontier about 12 miles N.W. of Nisibis, founded A.D. 504 by Anastasius to replace Nisibis, ceded to the Persians A.D. 563. It was built near the head of, and almost completely blocking, a narrow valley running north-north-east and south-south-west. It flanked the road to Mardin.

Belisarius, aged 24, appointed General of the East by Justinian in 529, was stationed here in June, 530, when Pezores arrived at Nisibis with a Persian army of 40,000 horse and foot, to invade the Roman empire. Reinforcements from Lebanon raised Belisarius' army to 25,000 undisciplined troops, discouraged by recent defeats. Daras was dominated on three sides by high ground. Thus, and the low spirits of the troops, made it unwise to stand a siege. Belisarius caused a ditch to be dug across the valley, the flanks protected by the high ground unsuited to cavalry. Openings allowed the Romans to counter attack. In the centre a 100 ft. angular projection, like an entrenched camp, gave flanking fire across the front and protected the front and exposed flanks of

and skirmished, but did not attack. Only a short time before, a Persian force had ridden to disaster into a similar ditch dug for them by the Ephthalite Huns. Pezores did not like the unusual steadiness in the Roman ranks any more than he liked the ditch. Also a stream, whose bed was four feet deep, probably interfered with his power to manoeuvre. The next day reinforcements brought the Persian strength to a total said to be 50,000 men. The Persians advanced about noon. Pezores relieved the front line with the second to keep up a continuous fire of archery, but the wind favoured the Roman bowmen. Both sides suffered heavy losses in this missile fight. The Persian horse charged the Roman left. The Roman cavalry gave way. Then the squadron of Pharas, moving along the high ground, fell on the Persian rear, and the 600 Hunnish cavalry from the left (east) angle of the central bastion, took the enemy in flank. The Persian horse was routed with heavy loss.

Belisarius noted a movement of the Persians, including the "Immortals," toward his right. He ordered the victorious Huns from the left flank to reinforce the similar detachment on the right, and added troops from his reserve. The Persian attack drove in the Roman cavalry on their front, but the Huns, charging from the west angle of the trench, penetrated between the two Persian lines and created disorder. The reinforcements sent by Belisarius charged also, and the defeated Roman cavalry rallied and counter-attacked. Surprised and almost surrounded, the Persians broke. The Roman lines now advanced across the ditch, and the victorious cavalry rolled up the Persian flank. Belisarius called an early halt to the pursuit lest his undisciplined troops might get out of hand and fall into an ambush.

This victory restored the prestige of Roman arms, raised morale and discipline, and established the reputation of Belisarius. The use of the ditch afforded security to the weakest part of the line. By its location, it protected the front, flanks and rear. It economized force by making use of the walls of Daras and the citizens to cover a possible retirement. It left the cavalry the greatest freedom of manoeuvre. Finally, it permitted a counter attack.

DARBHANGA, a town and district of British India, in the Tirhut division of Bihar. The town is on the left bank of the Little Bagmati river, and has a railway station. Pop. (1941) 69,203. The town is really a collection of villages round the residence of the Maharaja, a large modern building in extensive grounds. There are a hospital, with a medical college and a Lady Duffield hospital attached, and a town hall and large tanks extending for over a mile. The district of Darbhanga extends from the Nepal frontier to the Ganges. Area 3,347 sq. mi. Pop. (1941) 3,457,070. The district consists entirely of an alluvial plain, in which the principal rivers are the Ganges, Burh Gandak, Bagmati and Little Bagmati, Balan and Little Balan, and Tiljuga. Rice is the staple crop, and the cultivator is especially dependent on the winter harvest. In 1897 a famine affected the whole district except the Samastpur subdivision, and an other affected half the district in 1906-07. Indigo manufacture was formerly an important industry, but has declined. Sugar cultivation and manufacture have to some extent taken its place. Tobacco is also a valuable crop. The district is traversed by the main line of the Bengal and North-Western railway. Pusa (q.v.) in the west of the district is the headquarters of the Imperial Agricultural Department.

The Darbhanga raj, which was founded in the 16th century, is a name applied to a large estate which includes parts of the districts of Darbhanga, Muzaffarpur, Monghyr, Purnea and Bhagal-

PLAN OF THE BATTLE OF DARAS A.D. 530 IN WHICH BELISARIUS DEFEATED THE PERSIANS

two bodies of 600 Hunnish light cavalry, placed on either side of this bastion. Infantry manned the centre, and cavalry was posted on the flanks. In concealment, on the high ground beyond the Roman left (east) flank, was posted a squadron of 300 light horse, under Pharas. Belisarius kept a reserve under his own hand. The city walls gave the protection of overhead fire from the bows of the inhabitants of Daras and, probably, artillery engines.

Pezores arrayed his host in two lines. He kept the "Immortals" in reserve. The first day the Persians looked over the situation.

It is erroneous to suppose that every shepherd called Daphnis in pastoral poetry and romance is this Daphnis.

pur It was held by one of the chief noblemen of the province. Sir Rameshwara Singh Bihardur, Maharajadhiraja of Darbhanga, who was born in 1806 and on attaining his majority in 1828 was appointed to the Indian statutory civil service, which he resigned in 1885 in order to manage his estates. He was created raja bahadur in 1886 maharaja bahadur on his succession to the raj in 1898, and hereditary maharajadhiraja in 1920. Upon his death in 1929, he was succeeded by his son, Col Hon Dr Sir Rameshwara Singh, Maharajadhiraja of Darbhanga. K.C.I.E., who was born in 1907. He is the head of the Maitrili Brahmins in India.

D'ARBLAY, FRANCES (1752-1840), English novelist and diarist, better known as Fanny Burney, daughter of Dr Charles Burney (q.v.), was born at King's Lynn, Norfolk, on June 13, 1752. Her mother was Esther Sleepe, granddaughter of a French refugee named Dubois. Fanny was the fourth child in a family of six. Of her brothers, James (1750-1831) became an admiral and sailed with Captain Cook on his second and third voyages, and Charles Burney (1757-1817) was a well known classical scholar. In 1760 the family removed to London and Dr Burney, who was now a fashionable music master, took a house in Poland street. Mrs Burney died in 1761, when Fanny was only nine years old. Her sisters, Esther (Hetty), afterwards Mrs Charles Rousseau Burney and Susanna, afterwards Mrs Phillips, were sent to school in Paris, but Fanny was left to educate herself. Early in 1766 she paid her first visit to Dr Burney's friend Samuel Crisp at Chessington Hill, near Epsom. Dr Burney had first made Samuel Crisp's acquaintance about 1745 at the house of Luke Greville, grandfather of the diarist, and the two studied music while the rest of the guests hunted. Crisp wrote a play, *Virginia*, which was staged by David Garrick in 1754 at the request of the beautiful countess of Coventry (née Maria Gunning). The play had no great success, and in 1764 Crisp established himself in retirement at Chessington Hall, where he frequently entertained his sister, Mrs Sophia Gast, of Burford, Oxfordshire, and Dr Burney and his family, to whom he was familiarly known as "daddy" Crisp. It was to her "daddy" Crisp and her sister Susan that Fanny Burney addressed large portions of her diary and many of her letters. After his wife's death in 1767, Dr Burney married Elizabeth Allen, widow of a King's Lynn wine merchant.

From her 15th year Fanny lived in the midst of a brilliant social circle, gathered round her father in Poland street, and later in his new home in St Martin's street, Leicester Fields, London. Garrick was a frequent visitor and would arrive before eight o'clock in the morning. Of the various "lyons" they entertained she leaves a graphic account, notably of Omai, the Otaheitan native, and of Alexis Orlov, the favourite of Catherine II of Russia. Dr Johnson she first met at her father's home in March 1777. Her father's drawing room, where she met many of the chief musicians, actors and authors of the day, was in fact Fanny's only school. Her reading, however, was by no means limited. Macaulay stated that in the whole of Dr Burney's library there was but one novel, Fielding's *Amelia*, but Austin Dobson points out that she was acquainted with the abbe Prevost's *Doyen de Kallérme*, and with Marivaux's *Vis de Marianne*, besides *Clarissa Harlowe* and the books of Mrs Elizabeth Griffith and Mrs Frances Brooke. Her diary also contains the record of much more strenuous reading. Her stepmother, a woman of some cultivation, did not encourage habits of scribbling. Fanny, therefore, made a bonfire of her MSS, among them a *History of Caroline Evelyn*, a story containing an account of Evelina's mother. Luckily her journal did not meet with the same fate. The first entry in it was made on May 30, 1768, and it extended over 72 years. The earlier portions of it underwent wholesale editing in later days, and much of it was entirely obliterated. She planned out *Evelina*, or *A Young Lady's Entrance into the World*, long before it was written down. *Evelina* was published by Thomas Lowndes in the end of Jan 1778, but it was not until June that Dr Burney learned its authorship, when the book had been reviewed and praised everywhere. Fanny proudly told Mrs Thrale the secret. Mrs

Thrale wrote to Dr Burney on July 22: "Mr Johnson returned home full of the Prayers of the Book I had lent him, and protesting that there were passages in it which might do honour to Richardson. We talk of it for ever, and he feels aident after the denouement, he could not get rid of the Rogue, he said." Miss Burney soon visited the Thrales at Streatham, "the most consequential day I have spent since my birth" she calls the occasion. It was the prelude to much longer visits there. Dr Johnson's best compliments were made for her benefit, and eagerly transcribed in her diary. His affectionate friendship for "little Burney" only ceased with his death.

Evelina was a continued success. Sir Joshua Reynolds sat up all night to read it, as did Edmund Burke, who came next to Johnson in Miss Burney's esteem. She was introduced to Elizabeth Montagu and the other bluestocking ladies, to Richard Brinsley Sheridan, and to the gay Mrs Mary Cholmondeley, the sister of Peg Woffington, whose manner, as described in the diary, explains much of *Evelina*. At the suggestion of Mrs Thrale, and with offers of help from Arthur Murphy, and encouragement from Sheridan, Fanny began to write a comedy. Crisp, realising the limitations of her powers, tried to dissuade her, and the piece, *The Wivings*, was suppressed in deference to what she called a "hissing, groaning, cataclysmic epistle" from her two "daddies." Meanwhile her intercourse with Mrs Thrale proved very exacting and left her little time for writing. She went with her to Bath in 1780, and was at Streatham again in 1781. Her next book was written partly at Chessington and after much discussion with Mr Crisp, *Cecilia*, or *Memoirs of an Heiress*, by the author of *Evelina*, was published in 5 vols in 1782 by Messrs Payne and Cadell (who paid the author £250—not £2,000 as stated by Macaulay).

On April 24, 1783, Fanny Burney's "most judicious advisor and stimulating critic," "daddy" Crisp, died. He was her devoted friend, as she was to him, "the dearest thing on earth." The next year she was to lose two more friends. Mrs Thrale married Piozzi and Johnson died. Fanny had met the celebrated Mrs Delany in 1783, and she now attached herself to her. Mrs Delany, who was living (1785) in a house near Windsor castle, presented to her by George III, was on the friendliest terms with both the king and queen, and Queen Charlotte soon after offered Miss Burney the post of second keeper of the robes, with a salary of £200 a year, which after some hesitation was accepted. Fanny's own misgivings as to her usefulness for court life were quite justified. From Queen Charlotte she received unvarying kindness, though she was not very clever with her waiting maid's duties. She had to attend the queen's toilet, to take care of her lap-dog and her snuff box, and to help her senior, Mrs. Schwellenberg, in entertaining the king's equerries and visitors to tea. The constant association with Mrs Schwellenberg, who has been described as "a peevish old person of uncertain temper and impaired health, swaddled in the buckram of backstairs etiquette," proved to be the worst part of Fanny's duties. The strain told on her health, and after pressure both from Fanny and her numerous friends, Dr Burney prepared with her a joint memorial asking the queen's leave to resign. She left the royal service in July 1791 with a retiring pension of £100 a year, granted from the queen's private purse, and returned to her father's house at Chelsea.

In 1792 she became acquainted with a group of French exiles, who had taken a house, Jumper Hall, near Mickleham, where Fanny's sister, Mrs Phillips, lived. On July 21, 1793, she married one of the exiles, Alexandre d'Arblay, an artillery officer, who had been adjutant general to La Fayette. They took a cottage at Bookham on the strength of it appears of Miss Burney's

¹His letters to Mrs Crisp and another sister, Anne, were edited with the title of *Burford Papers* (1906), by W. H. Hutton.

second play, *Love and Fashion*, was actually put in rehearsal in 1799, but was withdrawn in the next year. In 1801 Madame D'Arbly accompanied her husband to Paris, where he eventually obtained a place in the civil service. In 1812 she returned to England, bringing with her her son Alexandre to escape the conscription. In 1814 she published *The Wanderer, or Female Difficulties*. Possibly because readers expected to find a description of her impressions of revolutionary France it had a large sale, from which the author realized £7,000. Nobody, it has been said, ever read *The Wanderer*. At the end of that year she returned to France. During the Hundred Days of 1815 she was in Belgium, and the vivid account in her *Diary* of Brussels during Waterloo may have been used by Thackeray in *Vanity Fair*. General D'Arbly now received permission to settle in England. After his death at Bath on May 3, 1818 his wife lived in Bolton street, Piccadilly. There she was visited in 1826 by Sir Walter Scott, who describes her (*Journal Nov. 18, 1826*) as an elderly lady with no remains of personal beauty, but with a gentle manner and a pleasing countenance. The later years of her life were occupied with the editing of the *Memoirs of Dr Burney, arranged from his own Manuscripts, from family papers and from personal recollections* (3 vols, 1832). Her style had, as time went on, altered for the worse, and this book is full of extraordinary affectations. Madame D'Arbly died in London on Jan 6, 1840 and was buried at Walsot, Bath, near her son and husband.

Madame D'Arbly's best title to the affections of modern readers is the *Diary and Letters*. Dr Johnson lives in its pages almost as vividly as in those of Boswell, and King George and his wife in a friendlier light than in most of their contemporary portraits. Croker, in *The Quarterly Review*, Apr. 1833 and June 1842, made two attacks on Madame D'Arbly. The first is an unfriendly but largely justifiable criticism on the *Memoirs of Dr Burney*. In the second a review of the first three volumes of the *Diary and Letters*, Croker abused the writer's innocent vanity, and declared that, considering their bulk and pretensions, the *Diary and Letters* were "nearly the most worthless we have ever waded through." These pronouncements drew forth the eloquent defence by Lord Macaulay, first printed in *The Edinburgh Review*, Jan 1843, which perhaps did more than anything else to maintain Madame D'Arbly's constant popularity.

BIBLIOGRAPHY.—*The Diary and Letters of Madame D'Arbly* was edited by her niece Charlotte Frances Barrett, in 7 vols (1842-46). The text, covering the years 1778-1840, was edited with preface, notes and reproductions of contemporary portraits and other illustrations, by Mr Austin Dobson in 6 vols (1904-05). This *Diary*, which begins with the publication of *Evieina*, was supplemented in 1886 by *The Early Diary of Frances Burney (1768-78)*, which in the first instance had been suppressed as being of purely private interest, edited by Mrs Annie Raime Ellis, with an introduction giving many particulars of the Burney family. Mrs Ellis also edited *Evieina* for "Bohn's Novelist's Library" in 1881, and *Credula* in 1882. See also Austin Dobson, *Fanny Burney (Madame D'Arbly)* (1903), in the "English Men of Letters Series"; S. E. Burney, *The Early Diary of Frances Burney*, with a selection from the journals of her sisters Susan and Charlotte Burney (1907); F. F. Moore, *The Keeper of the Robes*, (1911); C. B. Tinker, *Dr Johnson and Fanny Burney* (1912); T. B. Macaulay, *Essay on Frances Burney* (1919); R. B. Johnson, *Fanny Burney and the Burneys* (1919).

DARBOUX, JEAN GASTON (1842-1917), French mathematician, was born at Nîmes on Aug. 13, 1842. His father died in 1849, and under the guidance of his mother, and with her encouragement, he was educated at the École Normale, Paris. Pasteur became interested in Darboux, and created a teaching post for him at the École Normale. After acting as assistant to Bertrand in the chair of mathematical physics at the Collège de France (1866-67) he became successively professor of mathematics at the lycée Louis le Grand (1867-72), Maître de conférences at the École Normale (1872-73), assistant to the professor of rational mechanics at the Sorbonne (1873-80), professor of higher geometry at the Sorbonne (1880-86), dean of the faculty of science (1889-90) and perpetual secretary of the Academy of Science. Darboux, besides being an excellent teacher and a notable mathematician, was also a very capable organizer and the last two posts he held gave him ample scope in this direction. He died in Paris on Feb. 25, 1917.

Practically all his mathematical work was on geometry, his early papers (1864 and 1866) were on orthogonal surfaces, these were followed by a memoir on partial differential equations of the second order (1870), which embodied a new method of integration. In his treatise *Sur une Classe remarquable de courbes* (1873) Darboux developed the theory of the class of surfaces called cycloids. *Leçons sur la Théorie générale des surfaces et les applications géométriques du calcul infinitésimal* (4 vols, 1887-96) is one of Darboux's most important works, dealing with infinitesimal geometry, it embodies most of his previous research work. In 1898 the publication of *Leçons sur les systèmes orthogonaux et les coordonnées curvilignes* was commenced. Darboux was the author of a number of papers and memoirs on the approximation to functions of very large numbers, on discontinuous functions and on other subjects.

Darboux held honorary degrees of many foreign universities, he was a foreign member of the Royal Society and in 1916 was awarded the Sylvester Medal.

DARBOY, GEORGES (1813-1871), archbishop of Paris, was born at Lail Billot in Haute Marne on Jan. 16, 1813. He was appointed bishop of Nancy in 1859, and in January 1863 was raised to the archbishopric of Paris. The archbishop was a strenuous upholder of episcopal independence in the Gallican sense, and sought to suppress the jurisdiction of the Jesuits and other religious orders within his diocese. At the Vatican council (1869) he strongly opposed the dogma of papal infallibility, against which he voted as inopportune. When the dogma had been finally adopted, however, he submitted. During the Franco-Prussian War he organized relief for the wounded and remained at his post during the siege of Paris and the brief triumph of the Commune. On April 4, 1871, he was arrested by the Communards as a hostage and confined in the prison at Mazas, from which he was transferred to La Roquette on the advance of the army of Versailles. On May 7 he was shot within the prison along with other hostages. He died in the attitude of blessing and uttering words of forgiveness. His body was recovered with difficulty and received a public funeral (June 7). Darboy was the third archbishop of Paris who perished by violence between 1848 and 1871. He wrote a *Vie de St Thomas Becket* (1859) and translated the works of St Denis the Areopagite and the *Imitation of Christ*. See J. A. Foulon *Histoire de la vie et des œuvres de Mgr Darboy* (1889) and J. Guillemin, *Vie de Mgr Darboy* (1888) biographies written from the clerical standpoint.

DARBY, a borough of Delaware county, Pa., U.S.A., on the south west border of Philadelphia, near the Delaware river, served by the Baltimore and Ohio, and the Pennsylvania railways. It is largely a residential suburb.

The population was 13,188 in 1950 and 10,344 in 1940 by the federal census.

Darby was settled by eight Friends in 1682, and his one of the oldest libraries in the country. It was incorporated in 1853, but most of its development has taken place since 1900.

DARCY, THOMAS DARCY, BARON (1407-1537), English soldier, was a son of Sir William Darcy (d. 1488). In 1505, having been created Baron Darcy, he was made warden of the east marches towards Scotland. In 1511 Darcy led some troops to Spain to help Ferdinand and Isabella against the Moors, but he returned almost at once to England, and was with Henry VIII on his French campaign two years later. Darcy, who was one of the most powerful nobles on the border, was also a member of the royal council, dividing his time between state duties in London and a more active life in the north. He brought forward accusations against his former friend, Cardinal Wolsey, however, after the cardinal's fall his words and actions caused him to be suspected by Henry VIII. Disliking the separation from Rome, Darcy asserted that matrimonial cases were matters for the decision of the spiritual power and he communicated with Eustace Chapuys, the ambassador of the emperor Charles V., about an invasion of England in the interests of the Roman Catholics. Detained in London by the king, he was not allowed to return to Yorkshire until late in 1535, and about a year after his arrival in the north the rising known as the Pilgrimage of Grace broke out. For a short time Darcy defended Pontefract Castle against

MAP SHOWING THE LANDING
BEACHES S V W X Y AT GAL
LIPOLI

Hamilton thus gained a somewhat precarious footing at two points of the peninsula. But his two forces were some 15m

How to employ the fresh divisions coming out from home had to be decided by Hamilton. The French had from the outset favoured operations on the further side of the straits, and there was something to be said for such a plan of campaign. But descent at that quarter must involve a disembarkation in face of opposition, the perils of which had been made apparent on April 25, moreover, granting the landing to be successful, the forces would start work much further from the narrows of the Dar danelles, the objective, than were either Helles or Anzac. There were also not wanting inducements for the Allies to attempt a landing at Bulair, seeing that their presence at that point would carry with it the severance of the Turkish land communications with the peninsula. But this would likewise mean a landing in face of opposition, and the distance of Bulair from the Island of Imbros, the nearest base of operations for the peninsula, provided a strong argument, from the point of view of ship transport, against such an undertaking. Moreover, a landing either on the Asiatic side or at Bulair meant a dispersion of the Allies' forces as a whole, unless Helles or Anzac, or both of them, were to be abandoned, and the fact that the Ottoman commander-in-chief had to be prepared for his opponent adopting one of these two plans, offered a strong argument against selecting either of them, apart from any other considerations as to their tactical advantages or disadvantages.

British Plans—Hamilton decided that his great effort should be made at, and immediately north of, Anzac. The rugged bluffs on which Birdwood's men had taken root since April were spurs of a tangled mountain mass known as Sari Bair, from the topmost ridges of which the narrows were visible four or five miles off. Anzac was moreover, situated almost at the narrowest point of the peninsula. The plan was to reinforce Birdwood secretly by a division and a half (the 15th and part of the 10th) and that thus strengthened, he should secure possession of Sari Bair by a night attack. A further force (the 11th Div and the rest of the 10th) was on that same night to effect a landing at an entirely new point—Suvla bay—a few miles north of Anzac, where the Turks were known to be few. This force was to assist the troops attacking Sari Bair in due course, and the possession of Suvla bay would furnish troops ashore in and about this area with a much more sheltered landing place than the beaches about Anzac offered. The last divisions to arrive, the 53rd and 54th, were to be employed wherever should seem best after the offensive had begun, to land the whole of the reinforcements simultaneously would not have been practicable with the amount of water transport available.

The utmost secrecy was observed by the Allies' staff. Steps were taken to mislead the Ottoman authorities by means of feints and of reconnaissances executed at localities other than those selected for operations. False reports were circulated astiduously by the intelligence department. Liman von Sanders was well aware of the arrival of large bodies of British troops in the islands, but he remained in complete ignorance of his rival's real design until this was actually in course of execution. He had organized his forces as a southern group watching Anzac, while two divisions were retained near Bulair, where he was disposed to anticipate that the blow would fall. There were also large bodies of Turkish troops in reserve about Chanaa, and others about Kum Kale and Besika bay. Numerically the contending armies at this critical juncture were about equal, but the Turks were necessarily much dispersed, so that the result of the impending clash of arms really hinged upon the speed with which the attacking side should gain ground before the defenders had time to concentrate.

The Allies' offensive started on Aug. 6 with two preliminary enterprises. An onset was made upon part of the Turkish lines in the Helles area. Portions of Birdwood's force broke out of the southern end of the Anzac position and gained ground. But the real purpose of the two operations was to occupy the enemy's attention and to conceal a design of much greater moment.

Attack on Sari Bair—So dexterously had the assembling of the reinforcements in the Anzac area been effected that the Turks were entirely unaware that Birdwood's army had been nearly doubled. The plan for gaining possession of the Sari Bair mountain was that several columns were to move out from the northern end of the Anzac position at nightfall on Aug. 6 and, on reaching their appointed stations, were to wheel to the right and to work their way in the dark up certain steep but well-defined gullies that led up to the summit. But although the Turks were to some extent surprised, and although the outlets of the gullies were in consequence in the assailants' hands by midnight, so stubborn a resistance was offered by the defenders that by daybreak the columns were not much more than half way up, and all attempts to win the upper ridges failed on the 7th in the face of the Turkish reinforcements.

After a rearrangement of the troops during the night the offensive was resumed on Aug. 8, but except at one point very little progress was made. After a fresh reorganization during the dark hours another effort was made on the 9th, and on this occasion a small body of British and Indian troops actually fought their way to a commanding summit from which the narrows were seen, but they were driven off again. Next day the Turks, now a great force, counter-attacked and thrust those opposed to them back down the slopes all along the line. Whereupon strenuous fighting ceased. Both sides had lost heavily, but victory for all practical purposes rested with the Ottomans, even if the Anzac position had been extended considerably in a northerly direction.

as a result of the operations.

Landing at Suvla Bay—Stirring events had in the meanwhile been taking place around Suvla bay. The troops detailed for the landing in this quarter belonged to the British "New Army"; they were not conversant with active service conditions, and they were being highly tried in being called upon to execute a landing in force at night in face of opposition. There was indeed no precedent for an undertaking of this kind under modern tactical conditions, but the Turks were known not to be in sufficient strength to offer serious resistance. As it was the whole of the 11th Div was ashore before dawn, but the urgent need of pressing forward at once was not realized by the local commanders, and some confusion arose when the 10th Div arrived and began to disembark. No organized advance in force took place until late in the afternoon, and at nightfall the attacking force had only reached the foot of the hills lying to the east of the landing places and captured one advanced spur. The troops had suffered greatly from thirst, the arrangements with regard to water having practically broken down, mainly owing to the inexperience of the troops themselves.

Attack in the Hills—When Liman von Sanders learned during the night of Aug. 6-7 that the Allies were landing in force at Suvla and were attacking Sari Bair from Anzac, he ordered the two divisions at Bulair to proceed to Suvla with all speed. But this meant a two days' march along indifferent roads. Consequently there was still on Aug. 8 a great opening left for the attacking side to complete the first part of its programme, i.e., to gain possession of the heights to the east of Suvla which dominated the landing places and a considerable area of level ground around Suvla bay. But no organized move took place. The opportunity was allowed to slip by, and that night Turkish reinforcements began to arrive from Bulair and to occupy the all important high ground. Next morning the 10th and 11th Divs., supported in a measure by the 53rd Div., which had arrived during the night, advanced to the attack. But the effort failed, and when it was renewed on the following day the Turks had been so effectively reinforced that the offensive enjoyed little chance of achieving success. That day, Aug. 9, was the last on which there remained any hope either of the Sari Bair offensive achieving success or of the Suvla force establishing itself in a satisfactory position. This force, however, made a fresh attempt on the 10th to wrest the heights in front of it out of Osmanli keeping, but this failed completely, and further offensives in this quarter were abandoned for the time being.

Hamilton's carefully devised scheme of offensive operations had in fact come to naught in its most important features. The determined effort to secure possession of Sari Bair had miscarried. A footing had, it is true, been gained at Suvla, giving the Allies control of a fairly well sheltered inlet on the outer coast of the peninsula, but as the high ground within easy artillery range of the landing places, which overlooked the whole occupied area, remained in the hands of the Turks, much of the benefit hoped for from its acquisition was neutralized. Only a restricted patch of Ottoman territory had in fact been occupied, thanks to the new undertaking, and although the position at Anzac had been extended and improved it remained a very bad one. The Allies now occupied many miles of front in the peninsula, but there was scarcely a spot where the enemy did not enjoy the advantage in respect to ground, what the attacking forces needed from the outset was depth rather than breadth, and depth they had failed to secure. They had, moreover, incurred very heavy losses during the succession of combats lasting from Aug. 6 to 10, and, except for a mounted division coming from Egypt to fight on foot, no reinforcements were on the way, the 54th Div had already been swallowed up at Suvla. The defending side had also, no doubt, suffered heavily in casualties, notably on Sari Bair, but Liman von Sanders could fairly claim that even if some valuable ground had been lost by the Turks, he had held his own in a contest in which his adversary had enjoyed the initiative and had been in a position to effect a surprise.

An effort was made by the troops on the extreme left of the

Alles' position at Suvla to gain ground along the ridge north of the Suvla plain on Aug 15, but nothing came of it. Hamilton, however, did not despair of improving the situation in this area, so the mounted division from Egypt and another division from Helles were quietly concentrated there in support of the troops already on the spot, and on the 21st a determined attempt was made to capture some of the high ground which had baffled the

theatre. A temporary change of plan did occur a few days later owing to a French proposal to despatch four divisions to the scene to operate on the Asiatic side of the straits, whereupon the British Government became disposed also to send fresh divisions.

III EVENTS IN THE BALKANS AND EVACUATION

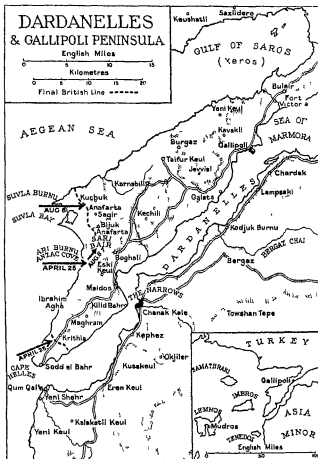

These projects were dropped early in September, owing very largely to the threatening aspect of affairs in the Balkans (*See SALONIKA CAMPAIGNS, SERBIAN CAMPAIGNS*).

The campaign by which the Central Powers and Bulgaria over-whelmed the Serbians for the time being, and by which direct communications were opened through Bulgaria between Austria-Hungary and the Ottoman empire, profoundly influenced the situation in the Gallipoli peninsula to the disadvantage of the Allies. Not only was all idea of reinforcing the Allied army that was planted in this region abandoned, but some of Hamilton's troops had before long been transferred to Salonika. The linking up of Turkey with the Central Powers by railway, moreover, connoted that Liman von Sanders would speedily be furnished with ample munitions of all kinds, which would make the prospect of Anglo-French forces gaining possession of the straits remoter than ever.

Withdrawal Discussed—By the middle of September the Paris Government had come to the conclusion that there was now no hope of victory in the Dardanelles theatre, but the British cabinet, influenced by anxiety as regards prestige in the East and by disinclination to abandon an enterprise in which great sacrifices had been incurred and from which much had at one time been expected, could not make up its mind to cut losses and to withdraw. On Hamilton being asked to give his views concerning the question of evacuation, he pronounced himself emphatically opposed to such a step, so Sir C. Monro was sent out from England to take his place. The new commander-in-chief, impressed by the very unsatisfactory positions occupied by the Allied troops, by the impossibility of their making any progress at their existing strength and by the risks that the army ran by clinging to such a shore without any safe harbour to depend upon for base in stormy weather, declared unhesitatingly in the closing days of October for a complete withdrawal after examining the situation on the spot and consulting with Birdwood, Byng and Davies.

The British cabinet would not accept the recommendation, and sent Lord Kitchener to investigate and report. He had viewed proposals to abandon the campaign with alarm, but after visiting the peninsula he realized that evacuation was the only justifiable course, and reported to that effect. All this time winter was drawing nearer and the need for a prompt decision was becoming more and more urgent, but the authorities in London lost another fortnight before, on Dec. 8, they at last sent instructions to Monro to withdraw from Suvla and Anzac, while retaining Helles.

Evacuation of Suvla Bay and Anzac—Anticipating orders to this effect, Monro had already made certain preparations for evacuation, and, as he was also responsible for the British forces at Salonika, had placed Birdwood in command, Gen. Godley relieving Birdwood at Anzac. It was recognized that the withdrawal of the vast accumulation of stores about the beaches, and also of the bulk of the actual troops, must be carried out gradually on successive nights, and this process was at once set on foot both at Suvla and at Anzac. The decision came to as to the final stage of the operation was that the front trenches should be held up to the last on the night of definite evacuation, and that the troops manning them should hasten straight to the beaches, everything removable having already been embarked, at a given moment the trenches (which at many points were but a few yards from those occupied by the Turks) would be vacated by detachments which by that hour would have shrunk to mere handfuls of men. The final night was provisionally fixed as that of Dec. 18-19, and, thanks to favourable weather and to the efficiency of the arrangements, the very critical undertaking was carried out with triumphant success just as had been laid down by programme ten days before. Night after night the landing places were scenes of

THE THREE THEATRES OF WAR ON THE GALLIPOLI PENINSULA CAPE HELLES ANZAC BEACH AND SUVLA BAY

attempts of the invaders on the 9th and 10th. Large forces were engaged on either side in this battle, and the attack was prepared by a heavy bombardment of the Ottoman trenches, in which war ships moored in Suvla Bay, where they were secure from sub-

Helles, and, as the right of the Suvla force was in touch with the left of the Anzac force in the low ground near the shore, Byng and Birdwood now held a continuous front extending from a point on the coast about 3m. NE of Suvla Bay near to Gaba Tepe, overlooked for practically the whole of its length by high ground in occupation of the Turks. Owing to the losses that had been suffered during the August combat and even before the final reverse of Aug. 21, Hamilton had cabled home asking for reinforcements and for the very large drafts needed to bring his depleted units up to their war establishment amounting to a total of 95,000 men. He had, however, been informed that no large bodies of fresh troops could be spared for the Dardanelles

unceasing activity was material, food supplies, animals and finally large bodies of troops, were got away. During the day-time reliefs took place as usual, pretences were made of landing stores and animals, and the result was that the Turks remained in complete ignorance of what was passing close to their lines. On Dec. 18 only a meagre force, composed almost entirely of infantry and disposed almost entirely in the front trenches, was holding a front of 10 mi. face to face with an enemy incomparably stronger in numbers. At nightfall the very few guns not yet withdrawn were hurried off to the jetties, then the troops along the front were quietly withdrawn by successive detachments, finally the parties still in the trenches slipped away, and when dawn broke the Turks discovered that the invaders were gone. Practically nothing worth mentioning had been left behind at Suva, and at Anzac, where conditions were more difficult, only a very few worn out guns had to be abandoned and some valuable war material destroyed. The relaxing by the Allies of their final hold upon a strip of the outer coast-line of the Gallipoli peninsula had been effected more successfully than the gall sanguine among them had permitted themselves to hope.

Yet, for a week subsequent to the receipt of the good news, the British government remained irresolute with regard to the policy to be pursued at Helles. Then, however, Monro received the expected sanction for evacuating that area likewise, and Birdwood promptly grappled with this fresh problem, a problem rendered more difficult than the last because Luman von Sanders had full warning of what might be expected and, moreover, he now enjoyed an enormous preponderance in force. He had 21 divisions available, while there were only four left to oppose him.

Evacuation of Cape Helles.—The same principles as had been adopted by Byng and Godley at Suva and Anzac were put into practice at Helles, the withdrawal of stores, war material, animals and personnel being carried out on successive nights. While the front trenches were to be held up to the last, the fighting force ashore was to be gradually reduced, and the detachments holding the front trenches were, at the given hour on the last night (fixed provisionally for that of Jan. 8-9), to vacate them and hurry straight off to the beaches. But the weather was none too favourable on several of the preliminary nights, and the enemy's guns gave a good deal of trouble on the beaches, causing many casualties. The Turks were aware that a withdrawal was gradually being carried out, but they could not tell which would be the final night, nor could they make sure how far the number of combatants within the British lines had been reduced. So, with the intention of ascertaining the strength of their opponents, on Jan. 7 they delivered a half-hearted attack upon the left of the British position. This was beaten off, and they came to the mistaken conclusion that the final evacuation was not imminent.

Shortly after dark set in on the night of Jan. 8-9 the wind rose ominously. Nevertheless the guns remaining to be embarked were got off, the infantry followed, and the last detachments quitted the front trenches at 11.45 P.M., without the Turks noting their departure. But when they reached the shore it was found, in the case of those detailed for Gully beach, that embarkation there was impracticable, so these had to march to "W" beach and they were not until till after 4 A.M. only being got off with great difficulty because of the surf. Several worn out guns had been intentionally left behind, besides much ordnance material and foodstuff, but practically all of this was rendered unseizable, for, just as the last boats were lowered off, the masses of stores were set on fire, and only then did the Turks discover that their opponents had evaded them a second time. The withdrawal from Helles had been a masterly military and naval achievement.

Most authorities on war agree that the failure of the Allies in this memorable campaign was primarily due to the abortive naval effort to force the Dardanelles. This gave the Turk such warning of what was in store that, when Hamilton's army was ready to land, the defenders were in a position to bring it at once to a standstill. The only chance of success after that lay in very substantial reinforcements reaching the scene promptly. But neither the British nor the French would divert the requisite military resources from the main theatre of war at the moment, and when

some additional troops were sent later, their numbers were in sufficient and it was too late.

DARDANUS, in Greek legend, son of Zeus and the Pleiad Electra, mythical founder of Dardanus on the Hellespont and ancestor of the Dardans of the Troad and, through Aeneas, of the Romans. His original home was supposed to have been Arcadia. Having slain his brother Ixion (according to some legends, Ixion was struck by lightning), Dardanus fled across the sea. He first stopped at Samothrace, and, when the island was visited by a flood, crossed over to the Troad. Being hospitably received by Teucer, he married his daughter Bateia and became the founder of the royal house of Troy.

DARDIC LANGUAGES, the name of a family of languages spoken immediately to the south of the Hindu Kush, and north of the frontier of British India, includes the group of Kafir languages spoken in Kafirstan, Khovar, spoken in the Chitral country, and the group of Shina languages, which includes the Shina of Gilgit, Kohistan, spoken in the Kohistan of the Indus and Swat rivers, and Kashmiri. Of all these Kashmiri is the only one which has received any literary cultivation. The Dardic languages are Aryan by origin, but are neither Iranian nor Indo-Aryan. They have developed phonetic peculiarities, and possess, almost unaltered and in common use, words which in India are seldom found except in Vedic Sanskrit. In each there is a small but unimportant element of Burushaski. (See also BURUSHASKI LANGUAGE, INDO-ARYAN LANGUAGES, KASHMIRI LANGUAGE.)

BIBLIOGRAPHY.—For the general question of the Dardic languages, see G. A. Grierson's *The Pisaca Languages of North-western India* (1906), *Linguistic Survey of India*, vol. viii, pt. II. For the different languages of this group see G. W. Leitner, *Dardistan* (Lahore, 1877), J. Bidduh, *Tribes of the Hindoo Kosh* (Calcutta, 1880), D. J. O'Brien, *Grammar and Vocabulary of the Khovar Dialect* (Lahore, 1895), J. Davidson, *Notes on the Baskgali (Aghil) Language* (Calcutta, 1901), G. Morgenstierne, *Report on a Linguistic Mission to Afghanistan* (Oslo, 1926).

DARDISTAN, a conventional name for a tract of country on the northwest frontier of India. It comprises the whole of Chitral, Yasin, Panyal, the Gilgit valley, Hunza and Nagar, the Astor valley, the Indus valley from Bunji to Batera, the Kohistan Malazai, &c., the upper reaches of the Panjkora river, and the Kohistan of Swat. The so-called Dard races are referred to by Ptolemy and Ptolemy, and are supposed to be a people of Aryan origin who ascended the Indus valley from the plains of the Punjab, reaching as far north as Chitral, where they dispossessed the Khos. They have left their traces in the different dialects, Khoswar, Burushki and Shina, spoken in the Gilgit agency.

DARES PHRYGIUS, according to Homer (*Iliad*, v, 9) a Trojan priest of Hephaestus. He was supposed to have been the author of an account of the destruction of Troy, and to have lived before Homer (Aelian, *Var. Hist.* vi, 2). A work in Latin, purporting to be a translation of this and entitled *Dareus Phrygae de excidio Troiae historia*, was much read in the middle ages and was then ascribed to Cornelius Nepos, but the language is corrupt, and the work belongs to a period much later than the time of Nepos (probably the 9th century A.D.). It is doubtful whether the work as we have it is an abridgement of a Latin work or an adaptation of a Greek original. Together with the similar work of Dictys Cretensis (with which it is generally printed), the *De excidio* forms the chief source for the numerous middle age accounts of the Trojan legend. (See DICTYS CRETENSIS.)

DAR ES SALAAM, ("the Haven of Peace," a seaport of East Africa, in 6° 50' S., 39° 20' E., capital of Tanganyika Territory. Pop. (1937) about 35,000, including approximately 1,200 Europeans and 9,000 Asiatics. The harbour is small but perfectly sheltered (hence its name), the entrance to it is through a narrow opening in the palm-covered shore. The depth of water at the entrance is from 20 to 34 ft according to the tides. Since 1927 a wharf 300 ft long has been made where ships can berth, but

loading and unloading is chiefly by lighters 593 steamers totalling 1,648,411 tons entered the port in 1935. A railway (built 1905-1914), starting from the harbour, goes via Tabora to Kigoma Ujiji on Lake Tanganyika, a distance of 772 mi. Motor roads connect with Morogoro, Bagamoyo, Sadani and Tanga. There is an aerodrome and it is a port of call on the London Durban service.

In 1862 Sayyed Majid, sultan of Zanibar, decided to build a town on the shores of the bay, and began the erection of a palace, which was never finished. In 1871 Majid died and his scheme was abandoned. In 1876 the construction of a road from the harbour to Victoria Nyanza was begun. The project failed, but in 1928 the port came into railway connection with Victoria Nyanza by the completion of the Tabora Mwanza line. In 1887 Carl Peters occupied the bay for the German East Africa company and in 1891 Dar es Salaam was made the administrative centre for German East Africa. A town was laid out on an ambitious scale, and it has fine buildings and a good botanical garden, the native quarter is distinct from that of the Europeans. Dar es Salaam was occupied by the British forces in 1916, the wireless station was destroyed in 1914. There is electricity and a good water supply, three newspapers, two theatres and several clubs.

DARESTE DE LA CHAVANNE, CLEOPHAS (1820-1882), French historian, was born in Paris. Educated at the École des Chartes, he became professor in the faculty of letters at Grenoble in 1844, and in 1849 at Lyons, where he remained nearly 30 years. His works comprise *Histoire de l'administration en France depuis Philippe Auguste* (2 vols., 1848), and *Histoire de France* (8 vols., 1865-73), completed by a *Histoire de la Restauration* (2 vols., 1880), and by a *Histoire du Gouvernement de Juillet*, a dry enumeration of dates and facts. Before the publication of Lavisse's great work, Dareste's general history of France was the best of its kind.

DARFUR is the westernmost province of the Anglo-Egyptian Sudan. It extends from about 10° N to 16° N and from 22° E to 27° 30' E, has an area of 138,150 sq mi. and an estimated population (1941) of 715,543. It is bounded north by the Libyan desert, west by French Equatorial Africa, south by Equatoria and east by Kordofan. The last named are provinces of the Anglo-Egyptian Sudan. The greater part of the country is a plateau from 2,000 to 3,000 ft. above sea level. A range of mountains of volcanic origin, Jebel Marra, runs north and south about the line of 24° E, and forms the watershed between the basins of the Nile and Lake Chad. About 70 mi. long and 10 mi. thick, its highest point attains more than 10,000 ft. Eastward the mountains fall gradually into sandy, bush covered steppes. North-east of Jebel Marra lies Jebel Meidob (highest point 1,500 ft.), a range much distorted by volcanic action, and Malha, an extinct volcano with a crater 300 ft. deep and 1 mi. in diameter. South of Jebel Marra are open plains, southwest is a plateau which reaches a height of between 3,000 and 4,000 ft. above sea level. The mountains are scored by numerous *khors*, whose lower courses across the tableland represent the beds of former rivers, dry except when scoured by torrents in the rainy season. In the west and south, water can always be obtained in the dry season by digging 5 or 6 ft. below the surface of the *khors*.

The climate, except in the south, where the rains are heavy and the soil is a damp clay, is healthful except after the rains. The rainy season lasts from the middle of May to the middle of September. In the neighbourhood of the *khors* the vegetation is fairly rich.

In the north and east the chief trees are various acacia, *Balanites aegyptiaca* and the baobab (*Adansonia digitata*) hollowed out by the inhabitants of this waterless area to serve as water tanks. In the south and southwest the density and variety of trees is greater and includes *Cordia abyssinica*, yielding valuable timber and mahogany. Cotton and tobacco are indigenous. Bulrush millet (*dakkin*) is the staple food crop but wheat, durra and other grains are grown. Other vegetable products are sesame, watermelons, onions and tomatoes, while the cattle owned by the Arabs produce large quantities of clarified butter (*semn*).

There are deposits of copper at Hofrat en Nabas in the south-

west and of rock salt in various places. Iron is also wrought in the southwest. Camels, cattle, horses and sheep are numerous and of good breed.

Inhabitants—The population is very mixed. The Negroid Fur (from whom the province takes its name) occupy Jebel Marra and the surrounding country. In the west are the Masalit, another non Arab tribe who, like the Fur, speak a language of their own, and in the north are the Zagahwa and Meidob, probably Hamitic immigrants of Mediterranean origin. The true Arabs are divided between the northern camel owners and the southern cattle owning sections. All are largely nomadic and move with their animals in search of water and grazing. In the east is the large Negroid tribe of the Berti, and there are also remnants of the Dagu and the Tunjur which were by tradition the early ruling houses of Darfur but were later driven out westward by the Fur.

Slaves, ostrich feathers, gum and ivory formerly were the chief articles of trade, a caravan going annually by the Arabian ("Forty Days") road to Asyut in Egypt and taking back cloth, firearms and other articles. The chief exports to the east are cattle, sheep, camels, tobacco, hides and skins, gum, melon seeds and sems. Much of the trade goes by truck to the railhead at El Obeid, three days away, but camels are extensively used. The principal imports are cotton goods, sugar, tea and coffee.

The capital and administrative headquarters of the province is El Fasher (population 1941 est., 14,171). It is some 350 mi. west of El Obeid and 500 mi. WSW of Khartoum. The province is divided into five districts with headquarters at El Fasher (central), Nyala (southern), Zalingei (western), Kudu (northern) and Gemma, the last named being also the headquarters of the Sultan of Dar Masalit. El Fasher and Gemma are airports on the main trans-African air route.

History—The Dagu Negroes, inhabitants of Jebel Marra, appear to have been the dominant race in Darfur in the earliest period to which the history of the country goes back. How long they ruled is uncertain, little being known of them save a list of kings. According to tradition the Dagu dynasty was displaced and Mohammedanism introduced, about the 14th century, by the Tunjur, who reached Darfur by way of Bornu and Wadai. The first Tunjur king was Ahmed el-Ma'ur, who married the daughter of the last Dagu monarch. His great grandson, the Sultan Dali, a celebrated figure in Darfur histories, was on his mother's side a Fur, and thus was affected a union between the Negro and Arab races. Dali divided the country into provinces, and established a penal code, which, under the title of *Kutab Dali* or Dali's Book, is still preserved, and shows principles essentially different from those of the Koran. His grandson Soleiman (usually distinguished by the Furiya epithet *Solon*, the Arab or the Red) reigned from 1596 to 1637, and was a great warrior and a devoted Mohammedan. Soleiman's grandson, Ahmed Bahr (1682-1722), made Islam the religion of the state, and increased the prosperity of the country by encouraging immigration from Bornu and Bagirmi. His rule extended east of the Nile as far as the banks of the Atbara. Under succeeding monarchs the country, involved in wars with Sennar and Wadai, declined in importance.

In 1799 Abd er-Rahman, the then reigning sultan, wrote to congratulate General Bonaparte on his defeat of the Mamelukes in Egypt. To this Bonaparte replied by asking the sultan to send him by the next caravan 2,000 black slaves upwards of 16 years old, strong and vigorous. To Abd er-Rahman likewise is due the situation of El Fasher, or the royal township. Previously the capitals of the sultans had been in or near Jebel Marra and the commercial capital was until the mahdi at Koba about 30 mi. NW of El Fasher. Mohammed el-Fadil, his son, whose reign lasted until 1836, devoted himself largely to the subjection of the semi-independent Arab tribes who lived in the country. In 1821 he lost the province of Kordofan to the Egyptians. Of his 40 sons, the third, Mohammed Hussein, was appointed his successor. In the latter part of his reign Hussein became involved in trouble with the Arab slave raiders who had seized the Bahr-el Ghazal, and upon the Darfurians as their especial "slave preserve".

Negroes of Bahr el Ghazal paid tribute of ivory and slaves to Darfur, and these were the chief objects of merchandise sold by the Darfurians to the Egyptian traders along the Arbaïn road to Asyut. Hussein died in 1873, blind and advanced in years, and the succession passed to his youngest son Ibrahim, who soon found himself engaged in a conflict with Zobeir (q.v.), the chief of the Bahr el-Ghazal slave traders, and with an Egyptian force from Khartoum. The war resulted in the destruction of the kingdom. Ibrahim was slain in battle in the autumn of 1874 and his uncle Hassab Alla, who sought to maintain the independence of his country, was captured in 1875 by the troops of the khedive and removed to Cairo with his family. The Darfurians were restive under Egyptian rule. Various revolts were suppressed, and in 1881 Slatin Bey (Sir Rudolf von Slatin) was made governor of the province. Slatin defended the province against the forces of the Mahdi, but was obliged to surrender (Dec. 1883), and Darfur was incorporated in the Mahdi's dominions. Following the overthrow of the khalifa at Omdurman in 1898 the new (Anglo-Egyptian) Sudan government recognized (1899) Ali Dinar, a grandson of Mohammed-el Fadhil, as sultan of Darfur. A rising attempted by Ali Dinar in 1915 necessitated a punitive expedition in which he was killed (Nov. 1916), and Darfur then became a province of the Sudan. Into it was incorporated the small, hitherto independent state of Dar Masalit which still enjoys a measure of self government under a Sultan, supported by a British resident.

The first European traveller known to have visited Darfur was William George Browne (q.v.), who spent two years (1793-95) at Kobbé. Gustav Nachtigal in 1873 spent some months in Darfur and since that time the country has become well known through the journeys of Gordon, Slatin and others.

BIBLIOGRAPHY.—Browne's account of Darfur will be found in his *Travels in Africa, Egypt and Syria* (1799), another early traveller, Sheikh Nuhammad Bey Omar El Tunisi gives an interesting account of the country in his *Voyage à Darfour*, transl. Perron (Paris, 1846), Nachtigal's *Sokara and Sudan* gives the results of that traveller's observations. The first ten chapters of Slatin Pasha's book *Fire and Sword in the Sudan* (English edition 1886) should be consulted. See also *The Anglo-Egyptian Sudan* (1905), edited by Lord Evelyn Gleichen, and the bibli. under *SUDAN*. (J. F. M., X.)

DARGAI (1) Mountain ridge of the Samana range, on the Kohat border, famous for the stand made there by the Afghans and Orakzais in the Tirah Campaign, 1897. (See *TIRAH*.) (2) The terminus, on the Peshawar border, of the frontier railway running from Nowshera to the foot of the Malakand pass.

Attack on Dargai (1897).—During the British advance through Tirah in 1897 two attacks were made on the Dargai ridge, the first on Oct. 18, and the second on the 20th. The first failed, the second succeeded through British pluck, in spite of its tactics being of the meanest order.

Dargai is a spur of the Samana range of hills which flanks the Kuram valley, north of Thal, Shinawari and Hangu. It is clearly visible from near Fort Gulistan, whence on the 20th, it was seen that the tribesmen were holding the ridge in strength, and were throwing up sangars (stone breastworks). Major General Yeatman-Biggs decided to take the position by a frontal attack, and though he had 24 guns at his disposal no attempt was made to concentrate their fire on the tribesmen. The result was that the attack was brought to a standstill by a hail of bullets, and a second one had to be mounted. More wisdom was then displayed, the guns being ordered to bombard the position for three minutes prior to the assault. This bombardment demoralized the tribesmen, and the position was carried. The British losses were 37 officers and other ranks killed, and 156 wounded. The bulk of these losses could have been avoided had it at first been realised that frontal attacks must be prepared by gun fire.

See C. E. Callwell, *Tirah*, (1897), H. D. Hutchinson, *The Campaign in Tirah 1897-98*, (1898), L. J. Shadwell, *Lockhart's Advance Through Tirah*, (1898).

DARGOMJSKY, ALEXANDER SERGEIVICH (1813-1890), Russian composer, was born at Tula on Feb. 14, 1813, and educated in St. Petersburg (Leningrad) He was frequently known as a talented musical amateur when in 1833 he met Glinka and was encouraged to devote himself to composition. His light

opera *Esmeïda* was written in 1839, and his *Roussalka* was performed in 1856, but he had much success or recognition either at home or abroad, except in Belgium, till the '60s, when he became one of Balakirev's circle. His opera *The Storm* which then became famous among the progressive Russian school, though it was not performed till 1872. Dargomysky died at St. Petersburg (Leningrad) on Jan. 17, 1890. His compositions include a number of songs and some orchestral pieces.

DARGU see *NUBA*

DARIAL, a gorge in the Caucasus, on the east of Mt. Kasbek, pierced by the river Terek for 8 m. between vertical walls of rock (5,900 ft.). It is mentioned in the Georgian annals, by Strabo and by Ptolemy. Being the only available passage across the Caucasus, it has been fortified at least since 150 B.C. In Russian poetry it has been immortalized by Lermontov. The present Russian fort, Darial, which guards this section of the Georgian military road, is at the northern issue of the gorge, at an altitude of 4,746 feet.

DARIEN, a district covering the eastern part of the isthmus joining Central and South America. It is mainly within the republic of Panama, and gives its name to a gulf of the Caribbean sea. Darién is of great interest in the history of geographical discovery. It was reconnoitred in the first year of the 16th century by Rodrigo Bastidas of Seville, and the first settlement was Santa Maria la Antigua, situated on the small Darién river, northwest of the mouth of the Atrato. In 1513 Vasco Núñez de Balboa stood "silent upon a peak in Darién," and saw the Pacific at his feet—stretching inland in the Gulf of San Miguel, and for long this narrow neck of land seemed alternately to proffer and refuse a means of transit between the two oceans. The first serious attempt to turn the isthmus to permanent account as a trade route dates from the beginning of the 18th century, and forms an interesting chapter in Scottish history. In 1695 an act was passed by the Scottish parliament giving extensive powers to a company trading to Africa and the Indies, and this company, under the advice of one of the most remarkable economists of the period, William Paterson (q.v.), determined to establish a colony on the isthmus of Darién midway between Porto Bello and Cartagena, two of Spain's strongholds, and to gain a free trade route to the Pacific "whereby to Britain would be secured the key to the universe, enabling their possessors to give laws to both oceans and to become the arbiters of a commercial world." On July 26, 1698 the pioneers set sail from Leith amid the cheers of an almost envious multitude, and on Nov. 4, with the loss of only 15 out of 1,200 men, they arrived at Darién, and took up their quarters in a well-defended spot, with a good harbour and excellent outlook. The country they named New Caledonia, and two sites selected for future cities were designated respectively New Edinburgh and New St. Andrews. At first all seemed to go well, but by and by lack of provisions, sickness and anarchy reduced the settlers to the most miserable plight, and in June 1699 they re-embarked in three vessels, a weak and hopeless company. Meanwhile, a supplementary expedition had been prepared in Scotland, two vessels were despatched in May, and four others followed in August. But this venture proved even more unfortunate than the former. The last addition to the settlement was the company of Capt. Alexander Campbell of Fonthill, who arrived only to learn that a Spanish force of 1,500 or 1,600 men lay encamped at Tubacanti on the river Santa Maria, waiting for the appearance of a Spanish squadron in order to make a combined attack on the fort. Campbell was at first successful in a surprise attack but after the arrival of the Spanish fleet the garrison was forced to capitulate, and Darién colony was no more. Of those who had taken part in the enterprise only a miserable handful ever reached their native land.

See J. S. Barbour, *A History of William Paterson and the Darién Company* (1907), A. H. Vairill, *Panama, Past and Present* (1921), E. Cullen, *Isthmus of Darien Ship Canal etc.* (2d ed. 1881), J. H. Burton, *The Darien Papers* (1849), and G. P. Insk, *Papers Relating to the Ships and Voyages of the Company of Scotland Trading to Africa and the Indies* (1924).

DARÍO, RUBÉN (1867-1916), South American poet, was born at Metapa (Nicaragua), and came to Madrid in 1892. In

his *Provas profanas* (1899) he revealed himself a symbolist, then, throwing off every trammel, ardent in the pursuit of all that was rare and new and beautiful, he astonished the Spanish-speaking world by his *Canto a la Argentina y otros Poemas* (1900), *Cantos de Vida y Esperanza* (1905), and *Canto errante* (1907). Heedless of rules and schools, Darius followed his own path, trying the boldest innovations, especially in metre. His experiments were not always successful, nor did he succeed in founding a school, but he has left his mark on Castilian verse, infusing into it new life and enlarging its traditional forms. He writes a nervous prose in such works as *Los Raros* (1893), *Tierras solares* (1904) and *Todo al Vuelo* (1912).

DARIUS, the name of three Persian kings (Pers *Daraya* *vanish*, Old Test. *Darius*).

1 **DARIUS THE GREAT**, the son of Hystaspes (q.v.). The principal source for his history is his own inscriptions, especially the great inscription of Behistun (q.v.), in which he relates how he gained the crown and put down the rebellions. In modern times his veracity has often been doubted, but without any sufficient reason, the whole tenor of his words shows that we can rely upon his account. The accounts given by Herodotus and Ctesias of his accession are in many points evidently dependent on this official version with many legendary stories interwoven, e.g., that Darius and his allies left the question as to which of them should become king to the decision of their horses, and that Darius won the crown by a trick of his groom.

Darius belonged to a younger branch of the royal family of the Achaemenidae. When, after the suicide of Cambyses (March 521), the usurper Gaumata ruled undisturbed over the whole empire under the name of Bardiya (Smerdis), son of Cyrus, and no one dared to gainsay him Darius, "with the help of Ahuramazda," attempted to regain the kingdom for the royal race. His father Hystaspes was then alive but evidently had not the courage to urge his claims. Assisted by six noble Persians, whose names he proclaims at the end of the Behistun inscription, he surprised and killed the usurper in a Median fortress (Oct. 521, for the chronology of these times cf. E. Meyer, *Forschungen zur alten Geschichte*, II, 472 ff.), and gained the crown. But this sudden change was the signal for an attempt on the part of all the eastern provinces to regain their independence. In Susiana, Babylon, Media, Sagartia, Margiana, usurpers arose, pretending to be of the old royal race, and gathered large armies around them, in Persia itself Vahyazdada imitated the example of Gaumata and was acknowledged by the majority of the people as the true Bardiya. Darius, with only a small army of Persians and Medes and some trustworthy generals, overcame all difficulties, and in 520 and 519 all the rebellions were put down (Babylon rebelled twice. Susiana even three times), and the authority of Darius was established throughout the empire.

Darius in his inscriptions appears as a fervent believer in the true religion of Zoroaster. But he was also a great statesman and organizer. The time of conquests had come to an end, the wars which Darius undertook, like those of Augustus, only served the purpose of gaining strong natural frontiers for the empire and keeping down the barbarous tribes on its borders. Thus Darius subjugated the wild nations of the Pontic and Armenian mountains and extended the Persian dominion to the Caucasus, for the same reasons he fought against the Sacae and other Turanian tribes. But by the organization which he gave to the empire he became the true successor of the great Cyrus. His organization of the provinces and the fixing of the tributes are described by Herodotus in 90 ff., evidently from good official sources. He fixed the coinage and introduced the gold coinage of the Dacic (which is not named after him, as the Greeks believed, but derived from a Persian word meaning "gold", in Middle Persian it is called *zarig*). He tried to develop the commerce of the empire and sent an expedition down the Kabul and the Indus, led by the Carian captain Scylax of Caryanda, who explored the Indian Ocean from the mouth of the Indus to Suex. He dug a canal from the Nile to Suex, and, as the fragments of a hieroglyphic inscription found there show, his ships sailed from the Nile through the Red Sea by Saba to Persia. He had connections with Carthage (see, the *Karka* of the Nakshu Rustam mscr.), and explored the shores of Sicily and Italy. At

the same time he attempted to gain the good will of the subject nations, and for this purpose promoted the aims of their priests. He allowed the Jews to build the Temple at Jerusalem. In Egypt his name appears on the temples which he built in Memphis, Edfu and the Great Oasis. He added the high priest of Suix, Uzhor, to Susa (as we learn from his inscription in the Vatican) and gave him full powers to reorganize the "house of life," the great medical school of the temple of Suix. In the Egyptian traditions he is considered as one of the great benefactors and lawgivers of the country (Herod. II, 110, Diod. I, 95). He stood in similar relations to the Greek sanctuaries (cf. his rescript to "his slave" Goditis the inspector of a royal park near Magnesia) on the Melaenai in which he grants freedom of lives and forced labour to the sacred territory of Apollo. See Cousin and Deschamps, *Bulletin de correspondance hellénique*, XII (1889), 520 and Dittenberger, *Syllloge mscr. græc.*, 2), all the Greek oracles in Asia Minor therefore stood on the side of Persia in the Persian wars and admonished the Greeks to at least no resistance. Even Delphi was not entirely free from the taint of Medism.

About 512 Darius undertook a war against the Scythians. A great army crossed the Bosphorus, subjugated eastern Thrace, and crossed the Danube. The purpose of this war can only have been to attack the nomadic Turanian tribes in the rear and thus to secure peace on the northern frontier of the empire. It was based upon a wrong geographical conception, even Alexander and his Macedonians believed that on the Hindu Kush (which they called Caucasus) and on the shores of the Jivartes (which they called Tanais, i.e., Don) they were quite near to the Black Sea. Of course the expedition undertaken on these grounds could not but prove a failure, having advanced for some weeks into the Russian steppes Darius was forced to return. The details given by Herodotus (according to him Darius had reached the Volga!) are quite fantastic, and the account which Darius himself had given on a tablet, which was added to his great inscriptions in Behistun, is destroyed with the exception of a few words (see R. W. Macan, *Herodotus*, vol. II, appendix 3, G. B. Grundy, *Griech. Pers. u. Ait.*, pp. 48-64, J. B. Bury, in *Classical Review*, July 1897).

Although European Greece was intimately connected with the coasts of Asia Minor, and the opposing parties in the Greek towns were continually soliciting his intervention, Darius did not meddle with their affairs. The Persian wars were begun by the Greeks themselves. The support which Athens and Eretria gave to the rebellious Ionians and Carians made an attempt to punish them inevitable as soon as the rebellion had been put down. But the first expedition, that of Mardonius, failed on the cliffs of Mt. Athos (492), and the army which was led into Attica by Darius in 490 was beaten at Marathon. Before Darius had finished his preparations for a third expedition an insurrection broke out in Egypt (486). In the next year Darius died, probably in Oct. 485, after a reign of 36 years. He was one of the greatest rulers the East has produced.

2 **DARIUS II**, **OCHUS** Artaxerxes I, who died in the beginning of 424, was followed by his son Xerxes II. But before two months had elapsed he was murdered by his brother Secydianus, or Sogdianus (the form of the name is uncertain). Against him rose a bastard brother, Ochus, satrap of Hyrcania, who after a short fight killed him and suppressed by treachery the attempt of his own brother Arsites to imitate his example (Ctesias ap. Phot. 44, Diod. XII, 71, 108, Pausan. VI, 5, 7). Ochus adopted the name Darius (in the chronicles called *Nothos*, the bastard). Neither Xerxes II. nor Secydianus occurs in the dates of the numerous Babylonian tablets from Nippur, here the dates of Darius II. follow immediately on those of Artaxerxes I. Of Darius II.'s reign we know very little (a rebellion of the Medes in 409 is mentioned in Xenophon, *Hellen* I, 2, 19), except that he was quite dependent on his wife Parysatis. In the excerpts from Ctesias some harem intrigues are recorded, in which he played a disreputable part. As long as the power of Athens remained intact he did not meddle in Greek affairs, even the support which the Athenians in 413 gave to the rebel Amorges in Caria would not have roused him (Andoc. II, 29, Thuc. VIII, 28, 54, Ctesias wrongly names his father Pisuthnes in his stead, an account of these wars is continued in

the great Lycian stele from Xanthus in the British Museum), had not the Athenian power broken down in the same year before Syracuse. He gave orders to his satraps in Asia Minor, Tissaphernes and Pharnabazus, to send in the overdue tribute of the Greek towns and to begin war with Athens, for this purpose they entered into an alliance with Sparta. In 408 he sent his son Cyrus to Asia Minor to carry on the war with greater energy. In 404 he died after a reign of 19 years, and was followed by Artaxerxes II.

3 DARIUS III, CODOMANNUS. The eunuch Bagoas (q.v.), having murdered Artaxerxes III in 338 and his son Aises in 336, raised to the throne a distant relation of the royal house, whose name, according to Justin 2.3, was Codomannus, and who had excelled in a war against the Cadusians (cf. Diod. xvii 5 ff., where his father is called Arsames, son of Ostanes, a brother of Artaxerxes). The new king, who adopted the name of Darius, noted the fate of his predecessors and saved himself from it by forcing Bagoas to drink the contents of the cup himself. In 336 Philip II of Macedon had sent an army into Asia Minor and in the spring of 334 the campaign of Alexander began. In the following year Darius himself took the field against the Macedonian king, but was beaten at Issus and in 331 at Arbela. In his flight to the east he was deposed and killed by Bessus (July 330).

The name Darius was also borne by many later dynasts of Persian origin, among them Kings of Persia (q.v.), Darius of Media Atropatene who was defeated by Pompeius, and Darius, king of Pontus in the time of Antony. (Ed. M.)

DARJEELING, a town and district of India, in the Rajshahi division of Bengal. The town is a hill station and the hot weather headquarters of the Bengal government. In 1941 it had a population of 25,813. It occupies a long ridge with two projecting spurs, on which are the town proper and the cantonments of Kataphar, Jalapahar and Lebong. The total area is nearly 5 sq. m., and the difference between its highest and lowest points is about 2,000 feet. Kataphar being 7,886 ft. and Lebong 5,970 ft. above sea level. It enjoys a temperate climate, the average maximum and minimum temperatures being only slightly above those of London, but it has a heavy rainfall, over 100 in. falling from June to October, in these months it is often hidden in mist. On the other hand, snow rarely falls in the winter. Darjeeling commands one of the most beautiful views in the world, for the eye goes up from the valleys to a succession of ranges

Lepchas in 1931. In the *tarai* the Bengali Rajbansis (originally Koch) predominate. Over a third of the district is occupied by forests, which cover the hills above 6,000 ft., and below 3,000 ft., these being the limits of cultivation of food crops and of tea. The principal cultivated products are tea and rice. There were 63,600 ac. in tea yielding 33,500,000 lb. in 1936-37, and 61,900 ac. in rice with an output of 73,400,000 lb. There were 2,700 ac. of cinchona trees and the factory at Mungpo is capable of manufacturing over 50,000 lb. of quinine annually. The Darjeeling Himalayan railway of 2 ft. gauge connects the town of Darjeeling with the Eastern Bengal State railway at Silguri, from which a branch line runs up the Tista valley to Kalimpong road.

The British connection with Darjeeling dates from 1816, when, at the close of the war with Nepal, the British made over to the Sikkim rajah the *tarai* tract, which had been wrested from him and annexed by Nepal. In 1835 the nucleus of the present district was created by a cession of a portion of the hills by the rajah of Sikkim to the British as a sanatorium. A military expedition against Sikkim, rendered necessary in 1850 by the imprisonment of Dr. A. Campbell, the superintendent of Darjeeling, and Sir Joseph Hooker, resulted in the annexation of the Sikkim *tarai* at the foot of the hills and of a portion of the hills beyond. The hill territory east of the Tista was acquired as the result of the Bhutan war of 1864, and now forms the Kalimpong sub-division.

DARK AGES, a term formerly used to cover the whole period between the end of classical civilization and the revival of learning in the 15th century. The use of the term implied an exclusive respect for classical standards in literature and art and a corresponding disparagement of all that was achieved between the decline of ancient culture and the work of Renaissance scholars, writers and artists. With the progress of mediaeval studies in the 19th century it became impossible for historians to dismiss one of the great constructive periods in human activity with an epithet implying contempt for its achievements, and the phrase has now become obsolete. It remains, nevertheless, the fact that the six centuries following the collapse of the Roman empire are in an especial sense dark through the insufficiency of historical evidence. Even so, it is necessary to remember that intellectual work of the highest quality was done by exceptional individuals in ages when life was insecure and its environment very discouraging to thought. The ages which form the prelude to mediaeval history are dark when compared with the time which followed them, but the foundations of mediaeval civilization were laid in these obscure and troubled centuries.

64095 (F.M.S.)

DARLEY, GEORGE (1795-1846), Irish poet, was born in Dublin and educated at Trinity college. He settled in London in 1821, where he contributed to *The London Magazine*, and became dramatic and art critic to the *Athenaeum*. His best known works are a fairy opera, *Sylvia* (1827), and a poem "Nepenthe" (1835).

See the *Selections from the Poems of George Darley*, with an introduction by R. A. Streetfield (1904), Claude Abbott, *Life and Letters of George Darley* (1908).

DARLING, CHARLES JOHN, 1ST BARON (1849-1936), English judge, was born on Dec. 6, 1849. At the age of 24 he was called to the bar, in 1885 he became a Q.C., and soon afterwards entered Parliament as Conservative member for Deptford. He sat in the House of Commons from 1888 until 1897 when he was knighted. His appointment in 1897 to a judgeship was not received with universal approval, but he later justified the choice by proving himself to be a man of acute understanding, with an unusual insight into human nature. In 1923 he retired, and in 1924 was granted a peerage. Among his published works are *Scintillae Juris* (1877), *Meditations in the Tea Room* (1879), *Seria Ludo* (1903), *On the Oxford Circuit* (1904), *Musings on Murder*, etc. (1925). *A Pensoner's Garden and other Verses* (1926).

See Evelyn Graham, *Lord Darling and his Fantous Trials* (1920). **DARLING, GRACE HORSLEY** (1815-1842), British heroine, was born at Bamborough, Northumberland, on Nov. 24, 1815. Her father, William Darling, was the keeper of the Longstone (Farne Islands) lighthouse. On the morning of Sept. 7, 1838, the "Forfarshire" bound from Hull to Dundee, with 63

persons on board, struck on the Farne Island, 43 being drowned. The wreck was observed from the lighthouse, and Darling and his daughter determined to try to reach the survivors. By a combination of daring, strength and skill, the father and daughter reached the wreck in their cable and brought back four men and a woman to the lighthouse. Darling and two of the rescued men then returned to the wreck and brought off the four remaining survivors. Grace Darling and her father received the gold medal of the Humane society, the treasury made a grant, and a public subscription was organized. Grace Darling died of consumption on Oct. 20, 1842.

See *Grace Darling, her true story* (1886), *Grace Darling, The Maid of the Isles* (1839), E. Hope, *Grace Darling* (1875), T. Arthur, *Grace Darling* (1885).

DARLING, a river of Australia (q.v.)

DARLINGTON, market town, county and parliamentary borough, Durham, England, 232 mi NW of London, on the LNE Ry. Pop (1938) 75,930. Area 10.1 sq mi. It lies on the river Skerne, a tributary of the Tees, not far from the main river. Its appearance is almost wholly modern, but there is a fine old parish church on the site of an earlier church, dedicated to St. Cuthbert. It is cruciform, and in style mainly transitional Norman, and has a central tower surmounted by a spire of the 14th century. Educational establishments include an Elizabethan grammar school, a training college and a technical school. There is a park of 44 ac. The industries include worsted spinning, coal and ironstone mining, quarrying and brickmaking, the manufacture of iron and steel into bridge castings, ships' engines, munitions, etc. The large locomotive works of the LNE Ry. were removed there from Gateshead. The town was incorporated in 1867.

Before the 19th century Darlington was noted for the manufacture of linen, worsted and flax, but it owes its modern importance to the opening of the railway between Darlington and Stockton on September 27, 1825. "Locomotive No. 1," the first that ever ran on a public railway, stands in Bank Top station. Darlington sent no members to parliament until 1862, after which year it returned one member. The fairs and markets in Darlington were formerly held by the bishop and were in existence as early as the 11th century. The markets and fairs were finally in 1864 purchased by the local authority.

DARLINGTON, a town of northeastern South Carolina U.S., served by the Atlantic Coast Line and the Seaboard Air Line railways, county seat of Darlington county. It is on federal highway 52. Pop (1950) 6,615. It has a cotton mill, a drinking cup factory, a chair factory, a flour and corn products mill, veneer mills, shingle mills, a cottonseed oil mill, ice and lumber manufacturing plants, tobacco warehouses and a tobacco stemming plant. It was founded about 1785. The Darlington international raceway is there.

DARLINGTONIA (named after Dr. William Darlington, an American botanist, 1782-1863), the Californian pitcher plant, belonging to the family Sarracenaceae. There is only one species, *D. californica*. According to Greene, the generic name should be *Chrysanthophora*. It grows in sphagnum swamps and springy hill sides in southwestern Oregon and northwestern California from near sea level to an altitude of 6000 ft in the Sierra Nevada Mts. The tall tubular leaves grow in a cluster arising from a stout horizontal stolon and have two forms. The juvenile leaf has the open top overhanging by a tapering lid like appendage, seen on the left of the illustration. Such leaves are found in seedlings and variously on small shoots. The leaf of maturity may reach a height of 3 ft, gradually expanding its diameter till at the top it expands suddenly into a bent over hood ending in a downward hanging appendage of the shape of a fishtail. Beneath the hood is a rounded opening, the entrance, guarded on the inside by a low, turned flange having many nectar glands, which are common also to the fishtail appendage, and to the interior surface of the hood. The roof of the hood is tessellated by white translucent patches, windows mullioned by green, eventually red bands of chlorophyll bearing tissues. To an insect approaching the entrance, attracted by the nectar on the fishtail or elsewhere beneath the hood, the fenestrations doubtless suggest a way of

exit. When once inside, the insect feeds on the abundant nectar and gradually, impelled by downward pointing hairs, falls into the hollow tubular leaf. Since digestive glands are absent, the decay of the captured insects takes place through the agency of bacteria, the products of this sort of digestion being absorbed by the walls of the tube, from which cuticle is absent.

An interesting matter in this connection is the invariable presence of living insect larvae in the wet mass of decaying insects which are usually very plentiful. A few of these are obligate

commensals, not occurring elsewhere. Among these are two minute gnats, *Mitrocampa knabi* and *M. edwardsii*. So abundant is the dead prey that the odour of decay has often been remarked.

(F. E. L.)

DARLY, MATTHIAS or MATTHEW, (? -1781?)

English caricaturist, designer and engraver. This extremely versatile artist produced social and political caricatures, designed architectural and mobiliary accessories, made many engravings for Thomas Chippendale, and sold his own productions at his print shop in the Strand (and elsewhere) which was one of the first to stock prepared colours and materials for artists. His first known publication is a coloured caricature, "The Cricket Players of Europe" (1741). Darly was in partnership with one Edwards, with whom he published many political prints which were collected annually

into volumes under the title of *Political and Satirical History*. He published in 1754 *A New Book of Chinese Designs* and engraved many of the plates for the *Director* of Thomas Chippendale in 1770-71 appeared Darly's most important work—*The Ornamental Architect or Young Artists' Instructor*, the title of which became in the 1773 edition *A Complete Body of Architecture, embellished with a great Variety of Ornament*. His last caricature was published in October 1780, and as his shop, No. 39 Strand, was let to a new tenant in 1781, it is presumed that he had by then died or become incapable of further work.

See George Paston, *Social Caricature in the 18th Century* (1905).

DARMESTER, ARSENE (1846-1888), elder brother of James Darmesteter (see below), was a distinguished philologist and man of letters. He studied under Gaston Paris at the École des Hautes Études, and became professor of old French language and literature at the Sorbonne. He collaborated with Adolphe Hatzfeld in a *Dictionnaire général de la langue française* (2 vols., 1895-1900). Among his most important work was the elucidation of old French by means of the many glosses in the mediaeval writings of Rashi and other French Jews. His scattered papers on romance and Jewish philology were collected by James Darmesteter as *Arsène Darmesteter, reliques scientifiques* (2 vols., 1890). His *Cours de grammaire historique de la langue française* was edited after his death by E. Muret and L. Sudre (1891-95, English edition, 1902).

DARMESTER, JAMES (1849-1894), French author and antiquarian, was born of Jewish parents at Château Salins, Alsace. The family name had originated in their earlier home at Darmstadt. He studied in Paris under Michel Bréal and Abel Bergaigne. In 1875 he published a thesis on the mythology of the *Zend Avesta*, and in 1877 became teacher of Zend at the École des Hautes Études. He followed up his researches with his *Études iraniennes* (1883), and ten years later published a complete translation of the *Zend Avesta*, with historical and philological commentary (3 vols., 1892-93), in the *Annales du musée Guimet*. He

DARLINGTONIA CALIFORNICA SHOWING TWO OF THE PITCHERS (LEAVES) WITH CURVED TOPS ENDING IN FISHTAIL FLAPS IN FRONT. A Flower with floral leaves removed. B Leaf cut across to show hollow interior.

also edited the *Zend Avesta* for Mrs. Muller's *Sacred Books of the East*. Darnley regarded the extant texts as far more recent than was commonly believed, placing the earliest in the 1st century B.C., and the bulk in the 3rd century A.D. In 1885 he was appointed professor in the Collège de France, and was sent to India in 1886 on a mission to collect the popular songs of the Afghans, a translation of which, with a valuable essay on the Afghan language and literature, he published on his return. His impressions of English dominion in India were conveyed in *Lettres sur l'Inde* (1888). He married A. Mary F. Robinson (see DUCLAUX, AGNES MARY FRANCES). He died on Oct. 19, 1894.

There is an *éloge* of James Darmstadter in the *Journal asiatique* (1894, vol. IV, pp. 340-341), and a notice by Henri Cordier, with a list of his writings, in *The Royal Asiatic Society's Journal* (Jan. 1895); see also Gaston Paris, "James Darmstadter," in *Penseurs et poètes* (1896, pp. 1-21).

DARMSTADT, a city of Germany, capital of the Land of Hesse Darmstadt, on a plain gently sloping from the Odenwald to the Rhine, 21 mi. by rail S.E. from Mainz and 17 mi. S from Frankfurt on Main. Pop. (1939) 115,526.

Darmstadt is mentioned in the 11th century, but in the 14th century it was still a village, held by the counts of Katzenelnbogen. It came by marriage into the possession of the house of Hesse in 1479, the male line of the house of Katzenelnbogen having in that year become extinct. The imperial army took it in the Schmalkaldic War, and destroyed the old castle. In 1567, after the death of Philip the Magnanimous, his youngest son George received Darmstadt and chose it as his residence. He was the founder of the line of Hesse Darmstadt. Its most brilliant days were those of the reign of Louis X. (1700-1830), the first grand duke, under whom the new town was built.

Darmstadt consists of an old and a new town, the streets of the former being narrow. In the new town is the stately Luisenplatz, on which are the old house of parliament, the palace and the post office, and, in the centre, a statue of the grand-duke Louis I., the founder of the new town. The ducal palace is a complex of buildings of various centuries. Adjoining the palace gardens, are the theatre and armory, and a little farther west the museum, a library of 600,000 volumes and 4,000 maps, a museum of Egyptian and German antiquities, a picture gallery with masterpieces of old German and Dutch schools, a natural history collection and the State archives. To the south of the castle lies the old town, with market square, town hall and town church. The town possesses a technical high school, having (after 1900) power to confer the degree of doctor of engineering, and attended by about 2,000 students, two gymnasia, a school of agriculture, an artisans' school and a botanical garden. The chemist, Justus von Liebig, was born in Darmstadt in 1803. The industries are very varied. The city was bombed by the British in World War II.

To the east of the town lies the Mathildenhöhe, formerly a park and now converted into villa residences. Here are the Alice hospital and the Russian church, built (1868-99) by the emperor Nicholas II of Russia in memory of his Hessian wife.

See Walther, *Darmstadt von es war und wie es geworden* (Darmstadt, 1896), and Zernin and Wörner, *Darmstadt und seine Umgebung* (Zürich, 1890).

DARMSTÄDTER UND NATIONALBANK The bank was a merger of the Bank für Handel und Industrie (generally known as the Darmstadter bank) with the Nationalbank für Deutschland. The amalgamation took place in 1922.

The Bank für Handel und Industrie was founded in 1853 in Darmstadt. It was in intimate relationship with the most important firms and possessed a large number of branches.

The Nationalbank für Deutschland was founded in 1881. In 1920, after having absorbed the Deutsche Nationalbank in Bremen and later the Holstenbank in Neumünster, it turned its attention to branch banking. The Nationalbank für Deutschland was, in its relationships with industrial enterprises, the main support of its business, and by founding, or collaborating in the founding, of many important German enterprises it established a basis for financial and syndicate investment business.

The capital of the Darmstadter und Nationalbank in 1928 was 60,000,000 reichsmarks, and the open reserves (which were

40,000,000 reichsmarks when the gold balance sheet was drawn up in 1924) were increased by 10,000,000 in 1927 and by an additional 5,000,000 in 1928, the reserves amounted to 55,000,000 reichsmarks. The Darmstadter und Nationalbank was represented in the management of the most important industrial enterprises in Germany and was on the board of approximately 1,000 companies. It founded together with an international group, the "Internationale Bank te Amsterdam" with the object of carrying out international financial transactions.

In 1928 the Darmstadter und Nationalbank owned 143 bank buildings, had branches in approximately 120 towns. The Darmstadter bank ceased to exist in 1931 on merging with the Dresdnerbank.

DARNLEY, HENRY STEWART or STUART, LORD (1545-1567), earl of Ross and duke of Albany, second husband of Mary, queen of Scots, was the eldest son of Matthew Stewart, earl of Lennox (1516-1571), and through his mother Lady Margaret Douglas (1515-1578) was a great-grandson of the English king Henry VII. Born at Temple Newsam in Yorkshire on Dec. 7, 1545, he was educated in England. After the death of Francis II in 1560 Darnley was sent to France by his mother, who hoped that he would become king of England on Elizabeth's death, and entertained the idea of his marriage with Mary, queen of Scots, the widow of Francis, as a means to this end. In 1561 both Lady Margaret and her son, who were English subjects, were imprisoned for a short time by Elizabeth, and Darnley spent some time at the English court before going to Scotland in Feb. 1565. The marriage of Mary and Darnley was now definitely proposed, and the queen, having nursed her new son through an attack of measles, decided to marry him. Elizabeth had permitted Darnley's journey to Scotland, but she and her council declared their dislike of the proposed marriage, and ordered Darnley and his father to repair to London, a command which was disobeyed. In March 1565 there were rumours that the marriage had already taken place, but the public marriage, at all events, was celebrated at Holyrood on July 29, 1565.

Although Mary had doubtless a short infatuation for Darnley, the union was mainly due to political motives, and trouble soon arose between them. Contrary to his expectations Darnley did not receive the crown matrimonial. He was on bad terms with the regent Murray and other powerful nobles, who disliked the marriage and were intriguing with Elizabeth. He was in addition soon estranged from his wife. He became jealous of David Rizzio, and was easily persuaded to assent to the murder of the Italian, a crime in which he took part. Immediately afterwards, however, flattered and cajoled by the queen, he betrayed his associates to her, and helped her to escape from Holyrood to Dunbar. Deserted and distrusted by his companions in the murder, he decided to leave Scotland, but a variety of causes prevented his departure, and meanwhile at Craigmillar a band of nobles undertook to free Mary from her husband, who refused to be present at the baptism of his son, James, at Stirling in Dec. 1566. The details of the conspiracy at Craigmillar are not clear, nor is it certain what part, if any, Mary took in these proceedings. The first intention may have been to obtain a divorce for the queen, but it was soon decided that Darnley must be killed. Rumours of the plot came to his ears, and he fled from Stirling to Glasgow, where he fell ill, possibly by poisoning, and where Mary came to visit him. Another reconciliation took place, and Darnley was persuaded to journey with Mary by easy stages to Edinburgh. They stayed for a few days at Kirk o' Field, a house just inside the city walls. On the evening of Feb. 9, 1567 Mary bed her husband farewell, and went to attend some guests in Edinburgh. A few hours later, on the morning of the 10th, Kirk o' Field was blown up with gunpowder. Darnley's body was found at some distance from the house, and it is supposed that he was strangled whilst making his escape. The remains were afterwards buried in the chapel at Holyrood.

As the father of King James I., Darnley is the direct ancestor of all the sovereigns of England since 1567.

For further information, and also for a list of the works bearing on his life, see the article MARY, QUEEN OF SCOTS.

DARRANG, a district of British India, in the province of Assam. It lies between the Bhutan and Daffa hills and the Brahmaputra, including many islands in the river. The administrative headquarters are at Tezpur, pop (1941) 17,879, on the right bank of the Brahmaputra. Its area is 2,804 sq mi. Pop (1941) 736,791. In 1914, 500 sq mi of almost uninhabited country were transferred to the Balipara Frontier tract, formed in that year. It is for the most part a level plain watered by many tributaries of the Brahmaputra. The district contains the two sub-divisions of Tezpur and Mangaldai, tea being the principal cultivation in the valley of Tezpur, and rice in Mangaldai. In Tezpur the population density rose to 303 per sq mi in 1931 from 47 in 1890, owing to large areas of wasteland being brought under cultivation. In Mangaldai the density in 1931 was 260 per sq mi. In 1936-37 there were 408,061 ac in rice with an output of 364,000, 000 lb, and 61,479 acres in tea yielding about 37,300,000 lb. There were 568 sq mi of reserved forests, mostly at the foot of the hills along the northern boundary.

DARROW, CLARENCE SEWARD (1857-1938), American lawyer, was born at Kinsman, O., April 15, 1857. He received a public school education and was called to the bar in 1875, afterwards practising in Chicago. He appeared as counsel in a large number of important cases, many of which attracted wide attention, and he became recognized as one of the leading criminal lawyers in the United States. He was retained by the labour organizations in much of their litigation of recent years. Among the celebrated cases in which he appeared were the Debs strike case (1895), anthracite coal strike arbitration (1902), Steunenburg murder (1907), *The Los Angeles Times* dynamite case (1911) and the *Loeb Leopold* case (1924). In July 1925 he defended J. T. Scopes at the Tennessee evolution trial. He wrote *Crime, Its Cause and Treatment* (1922), *Farmington, A Person Pearl and Other Essays*, *An Eye for an Eye*, *The Prohibition Mania*, and many other books and pamphlets on social, literary and economic questions.

For many years he was a well-known platform speaker and debater.

DARTER: see SNAKE BIRD

DARTFORD, a market town and municipal borough in the Dartford parliamentary division of Kent, England, 17 mi S E of London by the Southern railway. Pop (1938) 35,680. Area 66 sq mi. Its most noteworthy building is the parish church, restored in 1863, which contains an old fresco and several interesting brasses, and has a Norman tower, restored in 1910. The grammar school dates from 1756.

Dartford was the scene, in 1235, of the marriage, celebrated by proxy, between Isabella, sister of Henry III, and the Emperor Frederick II, and in 1331 a famous tournament was held in the place by Edward III. The same monarch established a Dominican nunnery on West Hill in 1256, of which, however, little remains. After the Dissolution it was used as a private residence by Henry VIII, Anne of Cleves and Elizabeth. The chantry of St Edmund the Martyr on the opposite side of the town was a part of Edward III's endowment to the priory, and became famous as a place of pilgrimage on the way to Canterbury. The part of Watling street which crossed there towards London was sometimes called "St Edmund's Way." On Dartford Heath is the mental home maintained by the London County Council. Greenhithe, on the banks of the Thames, has large chalk quarries in its neighbourhood, from which lime and cement are manufactured. One of the first attempts at the manufacture of paper in England was made here by Sir John Spielman (d. 1607), jeweller to Queen Elizabeth. Papermaking is still important here as well as chemical, metal and leatherworking. From 1894 until 1933, when it was incorporated, Dartford was governed by an urban district council.

DARTMOOR, high plateau, in south-west Devonshire, England. It is 23 mi from north to south, 20 mi from east to west, 215 sq mi in area with a mean altitude of 1,500 feet. It is the highest and easternmost in a broken chain of granitic elevations which extends to the Scilly Isles. The higher parts are open, bleak and wild. Sloping heights rise from the main tableland, crested with broken masses of granite, locally named *tors*. The

highest of these are Yes Tor and High Willhays (2,028 and 2,059 feet). Large parts of the moor are covered with mosses, and head waters of all the principal streams of Devonshire are found there. Only two good roads cross the moor, one between Exeter and Plymouth, and the other between Ashburton and Tavistock, intersecting at Two Bridges. The central part of Dartmoor was a royal forest from a date unknown, probably before the Conquest. Its woods were formerly more extensive than now, but a few small tracts of dwarf oaks remain in the lower parts. Previous to 1337 the forest had been granted to Richard, earl of Cornwall, by Henry III, and from then has belonged to the Duchy of Cornwall. The districts immediately surrounding the moor are called the Venville or Fenland districts. The holders of land by Venville tenure have rights of pasture, fishing, etc., in the forest. (For antiquarian remains see Devon.)

Princetown prison was built in 1806 to house French prisoners and was adapted for use as a convict station in 1850. A tract of moorland adjacent to the prison was brought under cultivation by the inmates.

DARTMOUTH, EARL OF, an English title borne by the family of Legge from 1710 to the present day.

WILLIAM LEGGE (c. 1609-1670), the eldest son of Edward Legge (d. 1616), vice-president of Munster, assisted Charles I in his war against the Scots in 1638. He was also very useful to the king during the months which preceded the outbreak of the Civil War, although his attempt to seize Hull in Jan. 1642 failed. During the war Legge distinguished himself at Chalgrove and at the first battle of Newbury, and in 1645 he became governor of Oxford. Legge helped Charles to escape from Hampton Court in 1647, and was arrested in May 1648. He was released, but was again captured in 1649, and remained in prison until 1653. He then spent some years abroad, but in 1659 was in England helping the royalists to rise. The old royalist died on Oct. 13, 1670.

Legge's eldest son, **GEORGE, BARON DARTMOUTH** (1647-1691), served as a volunteer in the navy during the Dutch war of 1665-1667. He was a member of the household of the duke of York, afterwards James II, was governor of Portsmouth and master-general of the army. In 1678 he commanded as colonel the troop at Neuport, and in 1682 he was created Baron Dartmouth. In 1683 as "admiral of a fleet" he sailed to Tangiers, dismantled the fortifications and brought back the English troops. Under James II Dartmouth was master of the horse and governor of the Tower of London, and in 1688 when William of Orange was expected, James II made him commander-in-chief of his fleet. Although himself loyal to James, the same cannot be said of many of his officers, and an engagement with the Dutch fleet was purposely avoided. Dartmouth, however, refused to assist in getting James Edward, prince of Wales, out of the country, and even reproved the king for attempting this proceeding. He then left the fleet and took the oath of allegiance to William and Mary, but in July 1691 he was arrested for treason, and was charged with offering to hand over Portsmouth to France and to command a French fleet. Dartmouth protested his innocence. He died in the Tower of London on Oct. 25, 1691, before the question was investigated. (See *Dartmouth Papers* [Hist. MSS. Comm. and Report ix and x pp. 9-12, 1870-72].)

Lord Dartmouth's only son, **WILLIAM, 1ST EARL OF DARTMOUTH** (1672-1750), succeeded to his father's barony in 1691. He became secretary of state for the southern department and joint keeper of the signet for Scotland in 1710. In 1711 he was created viscount Lewisham and earl of Dartmouth, in 1713 he exchanged his offices for that of keeper of the privy seal, which he held until the end of 1714. After a long period of retirement from public life he died on Dec. 15, 1750.

WILLIAM, 2ND EARL OF DARTMOUTH (1731-1801), grandson of the 1st earl, was lord privy seal at the beginning of the dispute with the American colonies. He advised them in 1777 to accept the conciliatory proposals put forward by Lord North, but in 1776 he opposed similar proposals and advocated the employment of force. In March 1782 he resigned his office, and in 1783 he, lord steward of the household, he died on July 15, 1801, his death marked the end of his intimacy with the early Methodists.

him the epithet of the *Palm singer*. Dartmouth College was named after him, and among his papers preserved at Patshull House, Wolverhampton, are many letters from America relating to the struggle for independence, printed in *Dartmouth Papers* (Hist. Mass Comm. 11th Rep pp 15-23 and spp v v 1-50, 1887).

DARTMOUTH, a seaport and municipal borough in the Torquay parliamentary division of Devonshire, England, 27 mi E. of Plymouth. Pop. (1951) 5,842. Area, 3 sq mi. It is near the mouth of the river Dart, which here forms an almost land-locked estuary, and is connected by ferry steamer with Kingswear on the opposite shore. The houses rise in tiers from the shore, beneath a range of hills. The parish church of St Saviour is of the 14th and 15th centuries, and retains an oak roof-screen and an ancient stone pulpit. The churches of St Petrox and St Clement, both Early English, represent respectively the ancient manors of Clifton and Hardness, which with Dartmouth give the borough its official name of Clifton Dartmouth Hardness.

Dartmouth castle, partly Tudor, commands the river, the wooded castle estate was purchased by the corporation in 1904. Portions of the cottage of Thomas Newcomen, one of the inventors of the steam engine, are preserved. The Royal Naval Cadet college was opened in 1905 to take the place of the Britannia training ship, it occupies the site of a former seat called Mount Boone. Dartmouth is a yachting centre, and shipping and yacht and boat building are the chief industries. Coal is imported, and resold. River steamers ply to Totnes, 10 mi up the Dart.

Probably owing its origin to Saxon invaders, Dartmouth was a seaport of importance when Earl Beorn was buried in its church in 1049. From its sheltered harbour William II embarked in 1099 for the relief of Mans and Richard I's squadron set sail for the crusades in 1190, while John landed here in 1214. The borough, first claimed as such in the reign of Henry I, was in existence by the middle of the 13th century. In the 13th century Dartmouth was required to furnish ships for the king's service, an obligation maintained throughout the following century. In 1342 the town was incorporated by a charter frequently confirmed by later sovereigns. A French attack on the town was repulsed in 1404, and in 1485 the burgesses received a royal grant of £40 for walling the town and stretching a chain across the river mouth. Dartmouth fitted out two ships against the Armada, and was captured by both the Royalists and Parliamentarians in the Civil War. Manorial markets were granted for Dartmouth in 1231 and 1301. These were important, since as early as 1225 the fleet provisioned there. During the 14th and 15th centuries there was a regular trade with Bordeaux and Brittany, and complaints of piracy by Dartmouth men were frequent.

DARTMOUTH, a town in Halifax county, Nova Scotia, Canada, on the northeastern side of Halifax harbour, connected by a steam ferry with Halifax. Pop. (1951) 14,687. It contains a large sugar refinery, foundries, machine shops, sawmills, skate, rope, nail, soap and sash factories and also the Imperial Oil works. Though practically a suburb of Halifax, Dartmouth was separately founded in 1750, it was the first town incorporated in Nova Scotia.

DARTMOUTH COLLEGE, an American institution of higher education for men, in Hanover, New Hampshire. It is Congregational by origin but actually non-sectarian. Dartmouth embraces the original college, incorporated in 1769, a medical school, dating from 1798, the Thayer School of Civil Engineering, established in 1867 by the bequest of General Sylvanus Thayer, and the Amos Tuck School of Administration and Finance, established in 1900 by Edward Tuck—the first, and until the establishment at Harvard of a similar graduate school, the only commercial school in the country whose work is largely post-graduate. The Chandler School of Sciences and the Arts was founded by Abel Chandler in 1851 in connection with Dartmouth and incorporated in the collegiate department in 1893 as the Chandler scientific course in the college. From 1866 to 1893 the New Hampshire College of Agriculture and the Mechanic Arts, now at Durham, was connected with Dartmouth. The medical school granted the degree of M.D. until 1914, when the last two clinical years were discontinued. The Thayer school and the Tuck school maintain each a two years' course, the first year of

which may, under certain conditions, be counted as the senior year of the undergraduate college.

The college has a beautiful campus, 15 instruction halls, 22 residence halls, with accommodation for 1,650 students, a large gymnasium, built in 1911 by alumni, with the Spaulding swimming pool (1919), the Davis field house (1927) and the Davis Hockey Rink (1928) attached, and large athletic fields, an auditorium, Webster hall (1901), College hall (1901), a social headquarters, Rollins chapel (1885), an astronomical and meteorological observatory (Shattuck observatory, 1854). The Fisher Ames Baker Memorial Library (completed 1928) replaces Wilson hall (1885) and contains 420,000 volumes. This library, the gift of George F. Baker, cost \$1,000,000. With it are associated the Carpenter Fine Arts Building (1929) and the Sanborn English House (1929). The physical laboratory is housed in Wilder hall (1899). Instruction in chemistry is given in the Steele Chemistry Laboratory (1921), the natural sciences in Silsby hall (1928) where geological and ethnological collections are also maintained, while botany is taught in the Clement greenhouse (1928). Parkhurst hall (1911) contains the administrative offices, and Robinson hall (1914) is the home of all college organizations other than athletic. The Mary Hitchcock Memorial Hospital (1893) is associated with the Medical School, and Dick Hall's house (1927), adjoining the hospital, is a completely equipped infirmary for 50 students. The college owns the Hanover Inn with accommodation for 150 guests and maintains single or apartment houses for 50 faculty families. A new upper-class dining hall, seating some 500 students, was completed in 1937.

Dartmouth is the outgrowth of Moor's Indian Charity School, founded by Eleazar Wheelock (1711-79) about 1750 at Lebanon, Connecticut. This school was named in 1755 in honour of Joshua Moor, who in this year gave to it lands and buildings. In 1765 Samson Occum (c. 1723-92), an Indian preacher and former student of the school, visited England and Scotland in its behalf and raised £10,000, whereupon plans were made for enlargement and for a change of site to Hanover. In 1769 the school was incorporated by a charter granted by George III as Dartmouth College, being named after the earl of Dartmouth, president of the trustees of the funds raised in Great Britain. The first college building, Dartmouth hall, was built between 1784 and 1791. This building was twice destroyed by fire, in 1904 and 1935, and reproduced in its original external form, the second time with fireproof materials. During the War of Independence the support from Great Britain was mostly withdrawn. In 1815 President John Wheelock (1754-1817), who succeeded his father in 1779, and was a Presbyterian and a Republican, was removed by the majority of the board of trustees, who were Congregationalists and Federalists, and Francis Brown was chosen in his place. Wheelock, upon his appeal to the legislature, was reinstated at the head of a new corporation, called Dartmouth University. The State courts upheld the legislature and the "university," but in 1819 after a famous argument of Daniel Webster (q.v.) in behalf of the "college" board of trustees as against the "university" board before the U.S. Supreme Court, that body decided that the private trust created by the charter of 1769 was inviolable, and Dr. Francis Brown and the old "college" board took possession of the institution's property. At the Webster centennial, celebrated in 1901, it was stated that the Dartmouth College Case had at that time been cited in judicial opinions more frequently than any other in the American reports—about 970 times.

The annals of the college have been tranquil with the exception of the disturbed years of the "university" controversy. During the Civil War Dartmouth College contributed 650 alumni and undergraduates to the Union armies. In World War I 3,319 graduates, undergraduates and faculty served in the military forces of the United States. Those dying in active service numbered 112. During most of the 19th century there was little variation in the numbers attending the college. With the administration of President William Jewett Tucker (1893-1909), however, a great expansion of equipment, endowment and enrolment took place which has continued during the present administration.

of Ernest Martin Hopkins, the 11th president. The enrolment increased from 256 students and 19 members of the faculty in 1890 to 2,400 students and more than 250 members of the faculty in 1936. In 1890 91% of the students came from New England. The constituency of the college gradually changed, until in 1936 less than 40% of the men came from homes within those States. The productive investment assets of the college also increased from approximately \$1,000,000 in 1890 to \$17,000,000 in 1936. The tuition cost in 1937 will be \$450 a year, provision is made through scholarships for assisting deserving students unable to pay this sum. The government is entrusted to a board of 12 trustees, five of whom are elected upon the nomination of the alumni. Applicants for the entering class are selected on a basis of character, scholarship and general promise of profiting by a college course. Out of more than 2,000 applicants who apply each year, an entering class of approximately 650 is selected.

During President Hopkins' administration several important features were introduced. A personnel department for advice on the curriculum and later occupation was organised. Outdoor recreation was made compulsory in the two lower classes. Experts in psychiatry and in nutrition were added to the college staff. In June 1925 certain major changes were made in the liberal arts curriculum providing *inter alia* for special treatment for students of higher grade and for the granting of but one degree, Bachelor of Arts. In 1929 senior fellowships were introduced, and more recently complete medical and surgical care without charge was adopted, and the curriculum was revised so as to insure greater study of modern social problems. One of the interesting influences of the college is promoted by the Dartmouth Outing Club, which maintains a chain of 23 cabins and shelters between Hanover and the White mountains and promotes winter sports.

Woodward* (Portsmouth, 1819), Shirley, *The Dartmouth College Cases* (St. Louis, Mo., 1879), Kent, *Commentaries on American Law* (vol. 1, Boston, 1884). (E F C)

DARU, PIERRE ANTOINE, COUNT (1767-1829), French soldier, was born at Montpellier on Jan. 12, 1767. He was a great army administrator, and served as commissary to the army of defence of the Breton coast (1793), in Masséna's army in Switzerland (1, 99), in Berthier's army in Italy (1799), and again on the Breton coast (1803). He enjoyed the complete confidence of Napoleon, who employed him as chief commissary of the Grand Army in 1805, and made him intendant of his military household. In the campaigns of 1806-07 he served, in his usual capacity, in the army which overthrew the forces of Russia and Prussia, and he had a share in drawing up the treaty of Tilsit (July 7, 1807). After this he supervised the administrative and financial duties in connection with the French army which occupied the principal fortresses of Prussia. At the congress of Erfurt, Daru was present at the interview between Goethe and Napoleon, and interposed tactful references to the works of the great poet. Daru served again as commissary in the campaign of 1809 against Austria, and late in the year 1813 he took up the portfolio of military affairs. After

good judgment, a good intellect, a great power for work, and a body and mind of iron."

Among Daru's literary works are his *Histoire de Venise* (7 vols., 1810), *Histoire de Bretagne* (3 vols., 1826), a poetical translation of Horace, *Discours en vers sur les facultés de l'homme* (1825), and *Astronomie*, a didactic poem in six cantos (1820).

See the "Notice" by Vilnet prefixed to the fourth edition of Daru's *Histoire de la république de Venise* (9 vols., 1853) and three articles by Sainte Beuve in *Causeries du lundi*, vol. ix. For the many letters of Napoleon to Daru see the *Correspondance de Napoleon I^{er}* (32 vols., 1858-70).

His son, NAPOLEON DARU (1807-1890), created count in 1837 was a liberal member of the National Assembly in 1848 and of the Legislative Assembly (1869) and foreign minister in 1870. He sat as a conservative in the National Assembly (1871-76), and in the senate from 1876 to 1879.

DARWEN, municipal borough, Darwen parliamentary division, Lancashire, England 20 mi. NW from Manchester by the L.M.S.R. Pop. (1938) 31,850. Area 9.2 sq. mi. It lies on the river Darwen, which traverses a densely populated manufacturing district. In the neighbourhood are collieries and stone quarries. Darwen manufactures cotton goods, paper, and has blast furnaces and fire clay works. It has a market hall, technical schools, a free library, and two public parks. A grammar school was opened in 1938. Darwen was incorporated in 1788.

DARWIN, CHARLES ROBERT (1809-1882), English naturalist, author of the *Origin of Species*, was born at Shrewsbury on Feb. 12, 1809, the grandson of Dr. Erasmus Darwin (qv). His mother, a daughter of Josiah Wedgwood (1730-1795), died in 1817. Charles's elder brother, Erasmus Alvey (1804-81), was interested in literature and art rather than science on the subject of the wide difference between the brothers. Charles wrote that he was "inclined to agree with Francis Galton in believing that education and environment produce only a small effect on the mind of anyone, and that most of our qualities are innate" (*Life and Letters*, London, 1887). Darwin considered that his own success was chiefly due to "the love of science, unbounded patience in long reflecting over any subject, industry in observing and collecting facts, and a fair share of invention as well as of common sense" (*ibid.*). He also says "I have steadily endeavoured to keep my mind free so as to give up any hypothesis, however much beloved (and I cannot resist forming one on every subject), as soon as facts are shown to be opposed to it" (*ibid.*). The essential causes of his success are to be found in this latter sentence, the creative genius ever inspired by existing knowledge to build hypotheses by whose aid further knowledge could be won, the calm unbiased mind, the love of truth which enabled him to abandon or to modify his own creations when they ceased to be supported by observation. The great naturalist appeared in the ripeness of time, when the world was ready for his splendid generalizations. In the preparation for Darwin Sir Charles Lyell's *Principles of Geology* played an important part, accustoming men's minds to the vast changes brought about by natural processes, and leading them by its lucid and temperate discussion of Lamarck's and other views, to reflect upon evolution.

Darwin studied at Shrewsbury School under Dr. Samuel Butler (1774-1839), and in 1825 went to Edinburgh to prepare for the medical profession, for which he was unfitted by nature. In 1828 his father sent him to Christ's College, Cambridge with the idea that he should become a clergyman. He took his degree in 1831, tenth in the list of those who do not seek honours. Both at Edinburgh and at Cambridge he gained the friendship of older scientific men—Robert Edmond Grant and William Macgillivray at the former, John Stevens Henslow and Adam Sedgwick at the latter. From Dec. 1831 to Oct. 1836, Darwin was on the "Beagle" as naturalist for the surveying expedition. After visiting the Cape de Verde and other Atlantic islands, the expedition surveyed on the South American coasts and adjacent islands (including the Galapagos), afterwards visiting Tahiti, New Zealand, Australia, Tasmania, Keeling Island, Maldives, Mauritius, St. Helena, Ascension, and Brazil de Verdes and

Azores on the way home his work on the geology of these countries and that on coral islands became the subject of volumes which he published after his return, as well as his *Journal of a Naturalist*, and his other contributions to the official narrative. The voyage was the real preparation for his life work. His observations on the relation between animals in islands and those of the nearest continent and between living animals and those most recently extinct and found fossil in the same country, related but not the same, led him to reflect upon the modification of species. He had also been much impressed by "the manner in which closely allied animals replace one another in proceeding southwards" in South America. His pocket book for 1837 contains the words "In July opened first note book on Transmutation of Species. Had been greatly struck from about the month of previous March [while still on the voyage and just over twenty seven years old] on character of South American fossils, and species on Galapagos Archipelago. These facts (especially latter) origin of all my views". From 1838 to 1841 he was secretary of the Geological society, and saw a great deal of Sir Charles Lyell, to whom he dedicated the second edition of his *Journal*. In Jan 1839 he married his cousin, Emma Wedgwood. They lived in London until 1842, when they moved to Down, which was Darwin's home for the rest of his life. From 1846 to 1854 he was chiefly engaged upon four monographs on the recent and fossil corripede Crustacea (*Rac Soc*, 1851 and 1854, *Palaeontograph Soc*, 1851 and 1854).

Soon after opening his note-book in 1837 he began to collect facts bearing upon the formation of the breeds of domestic animals and plants, and quickly saw "that selection was the keystone of man's success. But how selection could be applied to organisms living in a state of nature remained for some time a mystery to me." Various ideas as to the causes of evolution had to be successively abandoned. He had the idea of "laws of change" which affected species and finally led to their extinction, to some extent analogous to the causes which bring about the development, maturity and finally death of an individual. He also had the conception that species must give rise to other species or else die out, just as an individual dies unrepresented if it bears no offspring. In Oct 1838 he read *Malthus on Population*, and his observations having long since convinced him of the struggle for existence, it at once struck him "that under these circumstances favourable variations would tend to be preserved, and unfavourable ones to be destroyed. The result of this would be the formation of new species. Here, then, I had a theory by which to work." In June 1842 he wrote out a sketch, which in 1844 he expanded to an essay of 231 pages folio. The idea of progressive divergence as an advantage in itself, because the competition is most severe between organisms most closely related, did not occur to him until long after. In Jan 1844 he wrote to his friend, Sir Joseph Hooker "At last gleams of light have come, and I am almost convinced (quite contrary to the opinion I started with) that species are not (it is like confessing a murder) immutable" (*ibid*, n 13). In 1857 he explained his views to the great American botanist Asa Gray in a letter which afterwards became classical. He had completed about half of a third and far more expanded treatise, when, in June 1858, he received a manuscript from A. R. Wallace, who was then at Ternate in the Moluccas. Wallace wanted Darwin's opinion on the manuscript, which he asked should be forwarded to Lyell. Darwin was much startled to find in the essay a complete abstract of his own theory of natural selection. He wrote to Lyell, "your words have come true with a vengeance—that I should be forestalled." He placed himself in the hands of Lyell and Hooker, who decided to send Wallace's essay to the Linnean society, together with an abstract of Darwin's work, which they asked him to prepare, the joint essay being accompanied by an explanatory letter to the secretary. The title of the joint communication was "On the Tendency of Species to form Varieties, and on the Perpetuation of Varieties and Species by Natural Means of Selection." It was read on July 1, 1858, and appears in the *Ann Soc Journal (Zoology)* for that year. In this statement of the theory of natural selection, Darwin's part consisted of two sections, the first being extracts

from his 1844 essay, including a brief account of sexual selection, and the second an abstract of his letter to Asa Gray dated Sept 5, 1857. Canon H. B. Tristram was the first to apply the new theory, explaining by its aid the colours of desert birds, etc. (*Ibis* Oct 1859).

Acting under the advice of Lyell and Hooker, Darwin published on Nov 24, 1859, his great work, *On the Origin of Species by Means of Natural Selection, or the Preservation of Favoured Races in the Struggle for Life*. The whole edition of 1,250 copies was exhausted on the day of issue. The first four chapters explain the operation of artificial selection by man and of natural selection in consequence of the struggle for existence. The fifth chapter deals with the laws of variation and causes of modification other than natural selection. The five succeeding chapters consider difficulties in the way of a belief in evolution generally as well as in natural selection. The three remaining chapters (omitting the final recapitulation), deal with the evidence for evolution. The theory which suggested a cause of evolution is thus given the foremost place and the evidence for the existence of evolution considered last. This evidence had never been thought out and marshalled in a manner which bears any comparison with that of Darwin, and the work would have been epoch making had it consisted of the later chapters alone. A storm of controversy arose over the book, reaching its height at the British Association at Oxford in 1860, when the celebrated duel between T. H. Huxley and Bishop Wilberforce of Oxford took place. Throughout these struggles Huxley was the foremost champion for evolution and for fair play to natural selection, although he never entirely accepted the latter theory, holding that until man by his selection had made his domestic breeds sterile *inter se*, there was no sufficient evidence that selection accounts for natural species which are thus separated by the barrier of sterility.

The Variation of Animals and Plants under Domestication—Probably the second in importance of Darwin's works was published in 1868, and may be looked upon as a complete account of the material condensed in the first chapter of the *Origin*. He finally brought together an immense number of apparently disconnected sets of observations under his "provisional hypothesis of pangenesis," which assumes that every cell in the body, at every stage of growth and in maturity, is represented in each germ-cell by a gemmule. The germ-cell is only the meeting place of gemmules, and the true reproductive power lies in the whole of the body-cells which despatch their representatives, hence "pangenesis." There are reasons for believing that this infinitely complex conception, in which, as his letters show, he had great confidence, was forced upon Darwin in order to explain the hereditary transmission of acquired characters involved in the small proportion of Lamarckian doctrine which he incorporated. If such transmission does not occur, a simpler hypothesis based on the lines of Weismann's "continuity of the germ plasma" is sufficient to account for the facts (see HEREDITY, LAMARCKISM).

The Descent of Man and Selection in Relation to Sex (1871), both fulfilled his statement in the *Origin* that "light would be thrown on the origin of man and his history," and collected the evidence in support of his hypothesis of sexual selection which he had briefly described in the 1858 essay. *The Expression of the Emotions* (1872) offered a natural explanation of phenomena which appeared to be a difficulty in the way of the acceptance of evolution. In 1876 Darwin brought out his two previously published geological works on *Volcanic Islands and South America* as a single volume. The widely read *Formation of Vegetable Mould through the Action of Worms* appeared in 1881, and the *Fertilisation of Orchids* in 1862. *The Effects of Cross- and Self-Fertilisation in the Vegetable Kingdom* (1876) proved that the offspring of cross-fertilized individuals are more vigorous as well as more numerous, than those produced by a self-fertilized parent. *Different Forms of Flowers on Plants of the Same Species* (1877) demonstrates that each different form, although possessing both kinds of sexual organs, is specially adapted to be fertilized by the pollen of another form, and that when artificially fertilized by pollen from a plant of its own form, less vigorous offspring are produced. *Climbing Plants and Insectivorous Plants* were pub-

ished in 1875, and *The Power of Movement in Plants* in 1880. Darwin died on April 19, 1882, and was buried in Westminster Abbey on the 26th.

Two daughters and five sons survived him, four of the latter becoming prominent in the scientific world.—Sir George Howard (1845-1912), who became professor of astronomy and experimental philosophy at Cambridge, Sir Francis (1848-1925), distinguished botanist, Leonard (1850-1943), a major in the royal engineers, and afterwards well known as an economist and economist, and Sir Horace (1851-1928), civil engineer.

See *Life and Letters of Darwin*, including an autobiographical chapter, ed. by his son Francis Darwin (3 vols, 1887) and *More Letters* (2 vols, 1903), E. B. Poulton *Darwin and the Theory of Natural Selection* (1896) and *Darwin and the Origin of Species* (1909), L. Huxley, *Life and Letters of T. H. Huxley* (2 vols, 1900) and *Charles Darwin* (1921), V. L. Kellogg, *Darwinism To-day* (1907), J. Marchant, *A. R. Wallace, Letters*, etc. (3 vols, 1916) and H. Ward, *C. Darwin* (1917). See also HUXLEY, T. H., WALLACE, A. R. and HOOKER, SIR JOSEPH (E. B. P.)

DARWIN, ERASMUS (1731-1802), English man of science and poet, was born at Elton, Nottinghamshire. Educated at Cambridge and Edinburgh, he settled in 1756 as a physician at Nottingham, but moved in 1757 to Lichfield, and in 1781 to Derby, where he died suddenly on April 18, 1802. His fame as a poet rests upon his *Botanic Garden*, though he also wrote *The Temple of Nature*, or *the Origin of Society* (1803), and *The Shrine of Nature* (posthumously published). *The Botanic Garden* (1792, the part entitled *The Loves of the Plants* was published anonymously in 1789) shows a genuine scientific enthusiasm and interest in nature, but has little other poetic quality. The artificial character of the diction renders it in emotional passages stilted, and the personification is carried to excess. Botanical notes are added to the poem, and its eulogies of scientific men are frequent. Darwin's most important scientific work is his *Zoonomia* (1794-96), which contains a system of pathology, and a treatise on generation, in which he, in the words of his famous grandson, Charles Darwin, "anticipated the views and erroneous grounds of opinions of Lamarck." The essence of his views is contained in the hypothesis that through millions of ages all warm-blooded animals may have arisen from one living filament which the First Cause endowed with animality, with the power of acquiring new parts, attended with new propensities, directed by irritations, sensations, volitions and associations.

His *Phytologia*, or *the Philosophy of Agriculture and Gardening* (1799) claims that plants have sensation and volition. A paper on *Female Education in Boarding Schools* (1797) completes the list of his works.

ROBERT WARING DARWIN (1766-1848), his third son by his first marriage, a doctor at Shrewsbury, was the father of the famous Charles Darwin, and VIOLETTA, his eldest daughter by his second marriage, was the mother of Francis Galton.

See A. Seward, *Memoirs of the Life of Dr. Darwin* (1804), Charles Darwin, *Life of Erasmus Darwin, an introduction to an essay on his works by Ernst Krause* (1879), L. Brandl, "E. Darwin's Botanic Garden" in *Wiener Beiträge zur englischen Philologie* (1909).

DARWIN, SIR GEORGE HOWARD (1845-1912), British astronomer, was born at Down, Kent, on July 9, 1845, and was the second son of Charles Darwin (q.v.). He was educated at Trinity College, Cambridge (second wrangler and Smith's prizeman), of which he was elected a fellow in 1868, and where he became Plumian professor of astronomy and experimental philosophy in 1883. His work on the application of harmonic analysis and prediction to oceanic tides is monumental, as is his discussion of the influence of tidal friction in determining the evolution of binary systems, with special reference to the earth and moon. In an early paper he discussed the possibility of geological changes having altered considerably the inclination of the earth's axis to the plane of its orbit, and came to a negative conclusion. These works constituted the first attempt to apply thorough dynamical analysis to cosmogony and the major problems of geological evolution. He also carried out important work on periodic orbits of the problem of three bodies, figures of equilibrium of rotating masses of fluid and the stresses in the earth's crust produced by

continents and mountains. He was awarded the gold medal of the Royal Astronomical Society in 1892 and the Copley Medal of the Royal Society in 1911. In 1899 Darwin was made president of the Royal Astronomical Society, and of the British Association in 1905. He was made K.C.B. in 1905, and he died in Cambridge on Dec. 7, 1912.

Among his works are *The Tides and Kindred Phenomena in the Solar System* (1888, 3rd ed., 1911) and *Scientific Papers* (5 vols., Cambridge University Press, 1907-16), which has a supplementary volume edited by F. J. M. Stratton and J. Jackson, containing biographical memoirs.

DAS, CHITTA RANJAN (1870-1925), Indian politician and leader of the Swaraj party in Bengal, was born at Calcutta on Nov. 5, 1870. His father, Bhuvan Mohan Das, an attorney of the Calcutta High Court, joined the Brahmo Samaj, and edited the *Brahmo* (afterwards the *Bengal*) *Public Opinion*. Chitta Ranjan was educated at the London Missionary college, Bhowanipore, and at the Presidency college, Calcutta. He was called to the bar at the Middle Temple on June 26, 1894. Joining the Calcutta bar, he won his reputation by his successful defence of Arabinda Ghosh in the Manicktollah bomb conspiracy case. He defended relays of young political offenders, and assisted in keeping extremist papers, such as *Bande Mataram*, going, until they were checked by the Press Act, 1910.

In 1895 Das had published a volume of Bengali lyrics, *Malancha*, and two volumes of verse were issued during the World War. In 1915 Das started the Bengali monthly *Narayana*, but his chief journalistic work was the founding and conduct of the aggressive Swarajist daily, *Forward*. "His dominating note was hatred—and dread—of everything that savoured of the West."

It was the pursuit of these false gods that had converted Bengal from a smiling land of happiness and plenty into a salt waste over which brooded stagnation and death" (Lord Ronaldshay's *Heart of Aryavarta* [1925]). Yet he was sufficiently interested in the shaping of political reforms on western lines to participate in discussions leading to a joint address of Europeans and Indians to the Secretary of State and the Viceroy in Nov. 1917 (see Lionel Curtis, *Durkay*, 1920).

Das became an influential though not always tractable supporter of M. K. Gandhi in the non-cooperation movement launched in the autumn of 1918. He abandoned general practice, though he continued to defend political offenders, took to the wearing of *khaddar* (homespun cloth) and lived in the utmost simplicity. Late in 1921 the "volunteer" movement was proscribed in Bengal, as in other provinces. On Dec. 10, some days before Das was due to preside at the Indian National Congress at Ahmadabad he was arrested for issuing a public appeal for the proscribed organization, and was sentenced to six months' imprisonment. Mrs. Das, who was in thorough sympathy with her husband's views, was arrested, but by order of the governor, Lord Ronaldshay, was speedily released. Das presided at the National Congress at Gaya in Dec. 1922, and endeavoured to secure revocation of previous resolutions against entering the Legislatures, suggesting obstructive tactics in place of boycott. The controversy sharply divided the non-cooperationists, but with the decline of Gandhi's influence the Das policy gained ground, and influenced the second general election (1923) under the Reforms. Das was elected to the Bengal Council by more than one constituency. In the following April Das was elected the first mayor of Calcutta.

In the Bengal Legislature Das did not command a clear majority, but he was able to bring pressure both on the Independents and the Mohammedans, to whom he suggested a pact by which a substantial proportion of elective seats and public appointments would be reserved for them in the event of Swarajist success. He secured a bare majority on March 24, 1924, for refusal of the salaries of Ministers appointed provisionally by Lord Lytton. Lord Lytton's offer of a ministership to Das was refused after some hesitation. Das offered vehement opposition to the Bengal Criminal Law Amendment Ordinance (Oct. 25, 1924) subsequently embodied in a certified Act under which 110 persons, some of them associates of Das, were kept in imprisonment for terrorist conspiracy. His refusal of office and command of votes in the Legis-

Algeria, Sady from Egypt, and Khadrawy, Zahidi and Halawy from Iraq

The date palm is a beautiful tree, growing to a height of from 60 ft to 80 ft and its stem, which is strongly marked with the pruned stubs of old leaf bases, terminates in a crown of graceful shining, pinnate leaves, 10 ft to 20 ft long. The flowers are on separate spikes borne on different palms in branching spadices from the axils of leaves which emerged the previous year. Under cultivation it is necessary to pollinate the female flowers by artificial means. The fruit is a one seeded berry, usually more or less oblong, but varying much in shape, size, colour, quality and consistency of flesh according to variety and cultural conditions. A single large bunch may carry over 1000 fruits weighing 20 lbs or more. The dried fruit so widely exported contains more than half its weight of sugar and about 2% each of protein, fat and mineral matter.

Propagation is either from seeds or from suckers or offshoots which arise chiefly near the base of the stem in the early years of the palm's life.

Palms grown from seed are a source of new varieties but extremely variable and about equally divided as to number of males and females.

Offshoots reproduce the sex and character of the parent palm and are used for commercial plantings. When offshoots are 3-6 yrs old and have formed roots of their own they are removed and planted. Palms are spaced about 30 x 30 ft, they begin to bear in 5 or 6 yrs and reach full bearing at 10 to 15 yrs, yielding 100 to 200 lbs or more each. Although palms are known to live as long as 150 yrs, fruit production declines, and in commercial culture palms are replaced at a much earlier age.

All parts of the date palm yield products of economic value to the old world areas where it is grown. Its trunk furnishes timber for house building, the midribs of the leaves supply material for crates and furniture, the leaflets for basketry, the leaf bases for fuel, the fruit stalks for rope and fuel, the fibre for cordage and packing material, the seeds are sometimes ground and used for stock feed, vinegar and a strong liquor are made from the fermented fruit.

Date sugar is a valuable commercial product of India, obtained from the sap or toddy of *Phoenix sylvestris*, another species very closely related to the date palm. The juice, when not boiled down to form sugar, is either drunk fresh, or fermented and distilled to form an alcoholic drink. Date palm meal is obtained from the stem of a small species, *Phoenix farinifera*, growing in the hill country of southern India.

For further details see Sir G. Watt, *Dictionary of the Economic Products of India* (1892), *The Date Palm*, U.S. Department of Agriculture, Bureau of Plant Industry, Bulletin No. 53 (W. T. Swingle), 1904, and Reports of the Annual Date Growers' Institutes, Indio, Calif., yearly since 1924. (R. W. N.)

DATIA, an Indian state in the Bundelkhand Agency. It lies in the extreme northwest of Bundelkhand, near Gwalior, and is surrounded on all sides by other states of central India, except on the east where it meets the United Provinces. The state came under the British government after the treaty of Basen in 1802, and was settled with the present family by treaties in 1804, and 1818. Area, 846 sq. mi., pop. (1941) 174,072. The chief, whose title is maharaja, is a rajput of the Bundela clan, being descended from a younger son of a former chief of Orchha, his salute is 15 guns. The town of Datia (pop. 18,292 in 1931) is surrounded by a stone wall, enclosing handsome palaces, with gardens, the palace of Bir Singh Deo, of the 17th century, is "one of the finest examples of Hindu domestic architecture in India" and is now untenant.

DATIVE, the name, in grammar, of the case of the "indirect object," the person or thing to or for whom or which anything is given or done (Lat. *dativus*, giving or given, from *dare*, to give). In law, the word signifies something, such as an office which may be disposed of at will. In Scots law the term signifies "appointed or granted by a court." In Roman law, a *tutor* was either *dativus*, if expressly nominated in a testament, or *optivus*, if a power of selection was given.

DATO, EDUARDO (1856-1921), Spanish politician was

born at Corunna on Aug. 12, 1856. He graduated in law at Madrid university and was elected deputy in 1884. Under secretary for the home department in 1892, he became minister for the department in 1899, and promoted bills regarding accidents, insurance and women's labour. In Dec. 1902 he became minister of justice, in 1907 mayor of Madrid and then president of the chamber. He belonged to the "liberal conservative" variety of the conservative party, which his friend and political chief Silvela had represented, and after Silvela's death continued to maintain this attitude. When in 1913 Señor Maura refused to take power, Señor Dato dissented from his chief, carrying with him the majority of his party, which elected him as its leader. When World War I broke out, he was responsible for Spain's declaration of neutrality. Becoming prime minister again in June 1917, he faced with determination the revolutionary outbreaks and disturbances of that summer. He resigned in October, but in 1920 resumed office, and while prime minister was murdered in Madrid on March 8, 1921.

DATOLITE, a mineral species consisting of basic calcium and boron orthosilicate, $\text{Ca}(\text{BOH})_2\text{Si}_2\text{O}_6$. It is white or colourless, often with a greenish tinge, and may be either transparent or opaque, it usually occurs as well developed monoclinic crystals bounded by numerous bright faces, many of which often have a more or less pentagonal outline, but also in masses with a granular to compact texture, the fractured surfaces having the appearance of porcelain when the mineral is compact. Hardness 5-5½, specific gravity 3.0.

Dalotite is a mineral of secondary origin, and in its mode of occurrence it resembles the zeolites, being found with them in the amygdaloidal cavities of basic igneous rocks such as basalt, it is also found in gneiss and serpentine, and in metalliferous veins and in beds of iron ore. At Arendal in Norway, the original locality for both the crystallized and botryoidal, or fibrous variety (known also as botryolite), it is found in a bed of magnetite. In amygdaloidal basaltic rocks it is found at Bishopton in Renfrewshire and near Edinburgh, and as excellent crystallized specimens at several localities in the United States.

DATURA see STRAMONITUM

DAUB, KARL (1765-1836), German Protestant theologian was born at Cassel on March 20, 1765. He studied at Marburg and in 1795 became professor ordinarius of theology at Heidelberg, where he died on Nov. 22, 1836. Daub sought to bring about a speculative reconstruction of orthodox dogma, but he unfortunately ignored historical criticism. His *Lehrbuch der Katechetik* (1801) was written under the spell of Kant, his *Theologumena* (1806), his *Einleitung in das Studium der christl. Dogmatik* (1810), and his *Judas Ischarioth* (2 vols. 1816), in the spirit of Schelling, while *Die dogmatische Theologie jetziger Zeit* (1833) and *Vorlesungen über die Prolegomena zur Dogmatik* (1839) are Hegelian in principle.

See Rosenkranz, *Erinnerungen an Karl Daub* (1837), F. Lichtenberger, *History of German Theology* (1889), O. Pfleiderer, *Development of Theology* (1890).

DAUBENTON, LOUIS-JEAN-MARIE (1716-1800), French naturalist, was born at Montbar (Cote d'Or). In 1741 he graduated in medicine at Reims, and returned to his native town with the intention of practicing, but Buffon invited him to provide the anatomical descriptions for his treatise on natural history. His details of the dissection of 182 species of quadrupeds in Buffon's work brought him great reputation, but a feeling of jealousy induced Buffon to dispense with his services in the remainder of the treatise. Daubenton now occupied himself with zoological descriptions and dissections, the comparative anatomy of recent and fossil animals, vegetable physiology, mineralogy, experiments in agriculture, and the introduction of the merino sheep into France. In 1744 he was appointed keeper and demonstrator of the cabinet of natural history in Paris and from 1775 lectured on natural history in the college of medicine, and in 1783 on rural economy at the Alfort school. He was also professor of zoology at the Jardin du Roi. In Dec. 1799 he was a member of the senate.

Daubenton died in Paris on Jan. 1, 1800.

DAUBENY, CHARLES GILES (1795-1867), English scientist born at Stratton, Gloucestershire on Feb. 11, 1795, studied medicine. He was professor of chemistry (1822-55), and of botany (1834-67) at Oxford, and carried out numerous experiments on the effect of changes in soil, light, etc., on plants. He also made an extensive survey of the volcanoes of Europe, the results of which are embodied in his *Description of Active and Extinct Volcanoes* (1826, 2nd ed., 1848). He died at Oxford on Dec. 12, 1867.

DAUBIGNY, CHARLES FRANÇOIS (1817-1898), French landscape painter, allied in several ways with the Barbizon school, was born in Paris, on Feb. 15, 1817, but spent much time as a child at Valmondois, a village on the Oise to the north west of Paris. Daubigny was the son of an artist, and most of his family were painters. He studied in Italy and painted for nearly two years, he then returned to Paris, not to leave it again until, in 1860, he took a house at Auvers on the Oise. By 1837 Daubigny had become famous as a river and landscape painter, although he had been devoting himself as well to drawing in black and white, to etching, wood engraving and lithography. In 1855 his picture, "Lock at Optevoz," in the Louvre, was purchased by the State. He visited London more than once, and spent some time in Holland. He died in Paris on Feb. 19, 1898. Daubigny is chiefly preferred in his riverside pictures, of which he painted a great number, but although there are two landscapes by Daubigny in the Louvre, neither is a river view. They are for that reason not so typical as many of his smaller Oise and Seine pictures. Among his most ambitious canvases are "Springtime" (1857), in the Louvre, "Borde de la Cure, Morvan" (1864), "Villerville sur Mer" (1864), "Moonlight" (1865), "André sur Oise" (1868), and "Return of the Flock—Moonlight" (1878).

His followers and pupils included his son Karl (who painted so well that his works are occasionally mistaken for those of his father, though in few cases do they equal his father's mastery), Oudnot, Delpy and Damoye. The works of Daubigny are, like Corot's, to be found in many modern collections.

See Fred Henriet, *C. Daubigny et son oeuvre* (1878), Albert Wolff, *La Capitale de l'art Ch. François Daubigny* (1881), J. Claretie, *Peintres et sculpteurs contemporains Daubigny* (1882), D. Croal Thomson, *The Barbizon School of Painters* (1890), J. W. Mollett, *Daubigny* (1890).

DAUBLER, THEODORE (1876-1934), German writer, was born in Trieste on Aug. 17, 1876, of a merchant family. With the appearance of *Das Nordlicht* (1910) Daubler took his place at the head of the German expressionist movement. *Das Nordlicht* is a massive religious allegory showing the author's own path from agnosticism to mystic religion, under an epic-heroic disguise. Other characteristic poetical works are *Der Sternhelle Weg* (1915), *Das Sternenkind* (1916) and *Die Treppe zum Nordlicht* (1920), *Altische Sonette* (1924), prose works, *Mit silberner Sichel* (1921), *Wir wollen nicht verweilen* (autobiographical fragment, 1916), *Der neue Standpunkt* (artistic criticism, 1916), *Lucidarium in arte musica* (musical criticism, 1917), *Ein Kampf um die moderne Kunst*. Daubler was remarkably successful in giving his thought clear and often melodious expression, but his original work, possibly owing to its Latin forms, was slow in achieving wide popularity in Germany. His influence as a critic of expressionist music and poetry was, however, very great. In 1928 he was elected a member of the German Academy of Letters.

DAUDET, ALPHONSE (1840-1897), French novelist, was born at Nîmes on May 13, 1840, the son of a silk manufacturer. The lad, amid much truancy, had but a depressing boyhood. In 1856 he left Lyons, where his school-days had been mainly spent, and began life as an usher at Alais, in the south. The position proved to be intolerable. On Nov. 1, 1857, he abandoned teaching, and took refuge with his brother Ernest in Paris. Alphonse wrote poems, shortly collected into a small volume *Les Amoureux* (1858), which met with a fair reception, obtained employment on the *Figaro*, and wrote two or three plays. The duc de Morny appointed him to be one of his secretaries—a post which he held till Morny's death in 1865.

In 1866 appeared *Lettres de mon moulin*. The first of his longer books, *Le petit chapeau* (1868), the pathetic story of his own earlier years, is told with much grace and pathos. The year 1872 produced the famous *Aventures prodigieuses de Tartarin de Tarascon*, and the three act piece *L'Arlesienne*. *Fromont jeune et Risler aîné* (1874) struck a note, not new certainly in English literature, but comparatively new in French. Here was a writer who possessed the gift of laughter and tears, a writer not only sensible to pathos and sorrow, but also to moral beauty. Jack, the story of an illegitimate child, a maitre to his mother's selfishness, followed in 1876. Other novels followed: *Le Nabab* (1877), *Les Rois en exil* (1879), *Numa Roumestan* (1881), *Sapho* (1884) and *L'immortel* (1888). Daudet then wrote his own reminiscences in *Trente ans de Paris* (1887) and *Souvenirs d'un homme de lettres* (1888). These, with the three *Tartarins*—*Tartarin the mighty hunter*, *Tartarin the mountaineer*, *Tartarin the colonist*—and the admirable short stories, written for the most part before he had acquired fame and fortune, constitute his life work.

Though Daudet defended himself from the charge of imitating Dickens, it is difficult altogether to believe that so many similarities of spirit and manner were quite unsought. What, however, was purely his own was his style. It is a style that may rightly be called "impressionist," full of light and colour, not descriptive after the old fashion, but flashing its intended effect by a masterly juxtaposition of words that are like pigments. Nor does it convey, like the style of the Goncourts, to whose work it owed something, a constant feeling of effort. It is full of felicity and charm—as *charmeur* Zola has called him. An intimate friend of Edmond de Goncourt (who died in his house), of Flaubert, of Zola, Daudet belonged essentially to the naturalist school of fiction. His own experiences, his surroundings, the men with whom he had been brought into contact, various persons who had played a part, more or less public, in Paris life—all passed into his art. But he vivified the material supplied by his memory. His world has the great gift of life. *L'immortel* is a bitter attack on the French Academy, to which Auguste Bloy Daudet never belonged.

Daudet wrote some charming stories for children, among which may be mentioned *La Belle Nivernaise*, the story of an old boat and her crew. His married life—he married in 1867 Julia Allard—seems to have been singularly happy. There was perfect intellectual harmony, and Madame Daudet herself is known by her *Impressions de nature et d'art* (1899), *L'enfance d'une Parisienne* (1883), and by some literary studies written under the pseudonym of Karl Steen. In his later years Daudet suffered from insomnia, failure of health and consequent use of chloral. He died in Paris on Dec. 17, 1897.

The story of the date earlier than he told in his brother Ernest

reared for 20 years. He was elected to the Chamber as a deputy for Paris in 1919, but was defeated in 1924. With the establishment of peace his influence declined. In the summer of 1925 the death of his young son, Philippe, caused a great sensation. The finding of the judicial enquiry was that he had committed suicide, but Leon Daudet conducted a long and violent campaign to prove that he had, in fact, been murdered. He accused the chauffeur, in whose taxi his son had been found dead from a bullet wound, of complicity. The chauffeur prosecuted him, and Daudet was condemned to prison and ordered to pay heavy compensation. He was imprisoned in the *Santé* at Paris, from which he was rescued in 1927 by a ruse of royalists, who made the governor of the prison believe he had been pardoned. Daudet fled to Belgium.

The best of Daudet's novels are *L'astre noir* (1893), *Les Morticoles* (1894), *Le voyage de Shakespeare* and *Sylla et son destin* (1922). Among his philosophical and controversial works may be mentioned *L'Hérédité* (1916), *Le monde des images* (1919), *L'avant guerre* (1913), *Le stupide XIX^e siècle* (1922), and *Souvenirs* (1914). Daudet died July 1, 1922.

DAUGAVPILS (Dvinsk), a town of Latvia in 55° 53' N, 26° 32' E on the Daugava (Western Dvina). Pop. (1939) 41,160. Formerly a Russian fortress, it was later the training centre for the Lettish army. The Livonian Knights of the Sword founded a fort 12 mi. farther up the river, which was removed to its present site by Stephen Bathori, King of Poland, in 1582. Poland, Sweden and Russia alternately occupied this strategic border fort until the partition of Poland gave it to Russia in 1772. The French occupied it in 1812 and it was a centre of strife in both World Wars I and II. The population and industry (particularly timber) were diminished as a result of war and political shifts. (See LATVIA.)

DAULATABAD, hill fortress, Hyderabad State, India, about 10 m N.W. of the city of Aurangabad. The former city of Daulatabad (Deogiri) has shrunk to a village though its magnificent fortress and remains of public buildings survive. The fortress, on a conical rock, crowns a hill rising steeply from the plain to a height of some 600 ft. The outer wall, 2½ m. in circumference, once enclosed the ancient city of Deogiri (Devagiri), and between this and the base of the upper fort are three lines of defences. The only access to the summit is by a narrow bridge, with passage for two men abreast, and a long gallery, excavated in the rock, with a steep stair midway, the top of which is covered by a grating destined in time of war to form the hearth of a huge fire kept burning by the garrison above. The remarkable Chand Minar in Daulatabad, a tower 210 ft. high and originally covered with Persian glazed tiles, was erected in 1445 by Ala-ud-din Bahmani to commemorate his capture of the fort. The Chini Mahal, or China Palace, is the ruin of a building in which Abul Hasan, the last of the Kutb Shahi kings of Golconda, was imprisoned by Aurangzeb in 1687.

Deogiri is said to have been founded c. A.D. 1187 by Bhilama I who renounced his allegiance to the Chalukyas and established the power of the Yadava dynasty in the west. In 1294 the fort was captured by Ala-ud-din Khilji, and the rajyas were reduced to pay tribute. The tribute falling into arrears, Deogiri was again occupied by the Mohammedans, and in 1318 the last raja, Harpal, was flayed alive. Deogiri now became an important base for Muslim expeditions southwards, and in 1339 Mohammed ben Tughlak Shah made it his capital as Daulatabad ("Abode of Prosperity"), and made arrangements for transferring to it the population of Delhi, but troubles summoned him north, during his absence the Muslim governors of the Deccan revolted, and Daulatabad itself was taken by Zafar Khan, governor of Gulbarga. Later it fell into the hands successively of the Nizam Shahis, the emperor Akbar, the Shah of Ahmednagar, the Nizam Shahi usurper, Malik Amber, Shah Jehan, the Mogul emperor and the Nizam of Hyderabad, who took it after the death of Aurangzeb. Its glory, however, had already decayed owing to the removal of the seat of government by the emperors to Aurangabad.

DAUMER, GEORG FRIEDRICH (1800-1875), German writer on religion, was born on March 5, 1800, at Nuremberg and died on Dec. 13, 1875, at Würzburg. He was educated at

Erlangen and Leipzig, and, forsaking his early pietism, violently opposed Christianity, especially in his *Die Geheimnisse des christlichen Altertums* (1847). After the publication of *Religion des neuen Weltalters*, 3 vols. (1850), Daumer approached Mohammedanism in his poems, *Mohomet* (1848) and *Liederblüten der Hafs* (1846-51). He became a Catholic in 1859, and wrote *Das Wunder* (1874) and *Kaspar Hauser, sein Wesen, seine Unschuld* (1873).

DAUMET, PIERRE JÉRÔME HONORÉ (1826-1911), French architect, member of the Académie des Beaux-Arts, was born on Oct. 23, 1826, in Paris. He entered the École des Beaux-Arts in 1846, and in 1855 was awarded the Prix de Rome. In 1861 he was sent on an archaeological expedition to Macedonia, and published, in collaboration with Léon Henze, an important work on the researches in Thessaly, Thrace and Illyria. He was entrusted with the restoration of many monuments of French architecture, in particular the castle of Chantilly, the Palais de Justice, Paris, and the theatre at Orange. In Nov. 1884 Daumer undertook the construction of the Église du Sacre-Cœur on Montmartre, which had already been begun by the architect Abbadie, but the following year he abandoned the task, after a dispute with the ecclesiastical authorities. He died in Paris on Dec. 15, 1911.

DAUMIER, HONORÉ (1808-1879), French caricaturist and painter, was born at Marseilles on Feb. 20, 1808, and died at Valmondois on Feb. 11, 1879. Daumer started his artistic career by producing plates for music publishers and illustrations for advertisements, these were followed by anonymous work for publishers, in which he followed the style of Chariet and displayed considerable enthusiasm for the Napoleonic legend. When, in the reign of Louis Philippe, Philon launched the comic journal, *La Caricature*, Daumer joined its staff, which included Devéria, Raffet and Grandville, and started upon his pictorial campaign of scathing satire upon the foibles of the bourgeoisie, the corruption of the law and the incompetence of a blundering Government. His caricature of the king as "Gargantua" led to imprisonment for six months at Ste. Pélagie in 1832. The publication of *La Caricature* was discontinued soon after, but Philon provided a new field for Daumer's activity when he founded the *Charivari*. For this journal Daumer produced his famous social caricatures in which bourgeois society is held up to ridicule in the figure of Robert Macaire, the hero of a then popular melodrama. Another series, "L'histoire ancienne," was directed against the pseudo-classicism which held the art of the period in fetters. In 1848 Daumer embarked again on his political campaign still in the service of *Charivari*, which he left in 1866 and rejoined in 1864. In spite of his prodigious activity in the field of caricature—the list of Daumer's lithographed plates compiled in 1904 numbers no fewer than 3,058—he found time for flight in the higher sphere of painting. Except for the searching truthfulness of his vision and the powerful directness of his brushwork, it would be difficult to recognize the creator of "Robert Macaire," of "Les Bas bleus," "Les Bohémiens de Paris," and the "Masques," in the paintings of "Christ and His Apostles" at the Ryks Museum in Amsterdam, or in his "Good Samaritan," "Don Quixote and Sancho Panza," "Christ Mocked," or even in the sketches in the Ionides Collection at South Kensington. But as a painter, Daumer, one of the pioneers of naturalism, was before his time, and had little success until 1878, a year before his death, when M. Durand-Ruel collected his works for exhibition at his galleries and demonstrated the full range of the genius of the man who has been well called the Michelangelo of caricature. At the time of this exhibition Daumer, totally blind, was living in a cottage at Valmondois which was placed at his disposal by Corot, and where he breathed his last in 1879. An important exhibition of his works was held at the École des Beaux-Arts in 1900.

BIBLIOGRAPHY—See Arsène Alexandre, *Honoré Daumer, son œuvre* (1890); Gustave Geoffroy, *Daumer*, Henri Octave Uzanne, *Daumer and Gavarni (The Studio, 1904)*, F. Honoré Daumer (1907), A. Ruenemann, *Daumer als Illu.* (Munich, 1919), and M. T. Sudler, *Daumer, the Man and the* (1924).

DAUN (DHAUN), LEOPOLD JOSEF, COUNT VON (1705-1766), prince of Thiano, Austrian field marshal, was born at Vienna on Sept. 24, 1705. He served in Sicily (1718), in Italy and on the Rhine in the War of the Polish Succession (1734-35), against the Turks (1737-39) and in the War of the Austrian Succession (1740-42). He was present at Chotusitz and Prague, and led the advanced guard of Khevenhüller's army in the victorious Danube campaign of 1743. Field Marshal Traun, who succeeded Khevenhüller in 1744, thought equally highly of Daun, and entrusted him with the rearguard of the Austrian army when it escaped from the French to attack Frederick the Great. He held important commands in the battles of Hohenfriedberg and Soor and in the same year (1745) was promoted to the rank of *Feldzeugmeister*. After this he served in the Low Countries, and was present at the battle of Val. Maria Theresa made him commandant of Vienna and a knight of the Golden Fleece, and in 1754 he was elevated to the rank of field marshal.

During the interval of peace that preceded the Seven Years' War he began the reorganization of the Austrian army. He was not actively employed in the first campaigns of the war, but in 1757 he commanded the army raised to relieve Prague. On June 18, 1757, Daun defeated Frederick for the first time in his career in the desperately fought battle of Kolin (*q.v.*). The union of the relieving army with the forces of Prince Charles at Prague reduced Daun to the position of second in command, and as such he took part in the pursuit of the Prussians and the victory of Breslau. Frederick now reappeared and won the most brilliant victory of the age at Leuthen. Daun was not held accountable for the disaster, when Prince Charles resigned his command, Daun was appointed in his place. With the campaign of 1758 began the war of manoeuvre in which Daun, if he missed, through over caution, many opportunities of crushing the Prussians at least maintained a steady and cool resistance to the fiery strategy of Frederick. In 1758 Major General Loudon, acting under Daun's instructions, forced the king to raise the siege of Olmutz, and later in the same year Daun himself surprised Frederick at Hochkirch and inflicted a severe defeat upon him (Oct. 14). On Nov. 20-21, 1759, he surrounded the entire corps of General Finck at Maxen, forcing the Prussians to surrender. These successes were counterbalanced in the following year by the defeat of Loudon at Liegnitz, which was attributed to the dilatoriness of Daun, and Daun's own defeat in the great battle of Torgau (*q.v.*). In this engagement Daun was severely wounded.

He continued to command until the end of the war, and afterwards worked with the greatest energy at the reorganization of the imperial forces. In 1762 he had been appointed president of the *Hofkriegsrat*. He died on Feb. 5, 1766.

See *Der deutsche Fabius Cunctator, oder Leben u. Thaten S. E. des H. Leopold Reichsgrafen v. Daun K. K. F. M.* (Frankfurt and Leipzig, 1759-60), and works dealing with the wars of the period.

DAUNOU, PIERRE CLAUDE FRANÇOIS (1761-1840), French statesman and historian, born at Boulogne-sur-Mer on Aug. 18, 1761, was educated in the school of the Oratorians and joined the order in Paris in 1777. He was professor in various seminaries from 1780 till 1787, when he was ordained priest. Elected to the Convention by Pas de Calais, he associated himself with the Girondists, but strongly opposed the death sentence on the king. He took little part in the struggle against the Mountain, but was involved in the overthrow of his friends, and was imprisoned for a year. In December 1794 he returned to the Convention and was the principal author of the Constitution of the year III. It seems to have been due to his Girondist ideas that the Ancients were given the right of convoking the *corps législatif* outside Paris, an expedient which made possible Napoleon's *coup d'état* of the 18th and 19th Brumaire. The creation of the Institute was also due to Daunou, who drew up the plan for its organization. His energy was largely responsible for the suppression of the royalist insurrection of the 13th Vendémiaire, and the important place he occupied at the beginning of the Directory is indicated by the fact that he was elected by twenty-seven departments as member of the Council of Five Hundred, and became its first president. He himself had set the age qualification of the directors at forty, and thus debarred himself as candidate, as he

was only thirty four. The direction of affairs having passed into the hands of Talleyrand and his associates, Daunou turned once more to literature, but in 1798 he was sent to Rome to organize the republic there, and again, almost against his will, he lent his aid to Napoleon in the preparation of the Constitution of the year VIII. He supported Napoleon's policy in the controversy with the Vatican in his *Sur la puissance temporelle du Pape* (1809). Still, he took little part in the new regime, with which at heart he had no sympathy, and turned more and more to literature. At the Restoration he was deprived of the post of archivist of the Empire, which he had held from 1807, but from 1810 to 1830 (when he again became archivist of the kingdom) he held the chair of history and ethics at the Collège de France. In 1839 he was made a peer. He died in 1840.

In politics Daunou was a Girondist without combativeness, he was a confirmed republican who lent himself always to the policy of conciliation, but whose probity remained unchallenged. He belonged essentially to the centre and lacked both the genius and the temperament which might have secured for him a commanding place in a revolutionary era. As a historian he had a breadth of view remarkable for his time, for although thoroughly imbued with the classical spirit of the 18th century, he was able to do justice to the middle ages. His *Discours sur l'état des lettres en France au XIII^e siècle*, in the 16th volume of the *Histoire littéraire de la France*, is a remarkable contribution to that vast collection, especially as coming from an author so profoundly learned in the ancient classics. Daunou's lectures at the Collège de France, collected and published after his death, fill 20 volumes (*Cours d'études historiques*, 1842-1846). They treat principally of the criticism of sources and the proper method of writing history, and occupy an important place in the evolution of the scientific study of history in France. Personally Daunou was reserved and somewhat austere, preserving in his habits a strange mixture of bourgeois and monk. His indefatigable work as archivist in the time when Napoleon was transferring so many treasures to Paris is not his least claim to the gratitude of scholars.

See François Auguste Marie Mignet, *Notice historique sur la vie et les travaux de Daunou* (1843), Saint René Taillander, *Documents biographiques sur Daunou* (1847), including a full list of his works. Charles Augustin Sainte-Beuve, *Daunou* in vol. iii of his *Portraits contemporains* (1869-71) (unfavourable and somewhat unfair).

DAUPHIN, an ancient title in France, borne only by the counts and dauphins of Vienne, the dauphins of Auvergne and, from 1364, by the eldest son of the king of France. The origin of this curious title is obscure. It was an old custom in the family of the counts of Albon that members should be given more than one name, i.e., a Christian name and a personal surname. Moreover, the eldest son of the count always took holy orders, a younger son succeeding his father as ruler of the county.

These counts of Albon became counts also of Viennois in the 12th century. Guigue VIII of Albon (III of Viennois) had three sons by his wife Mahaud the English. Humbert, who became archbishop of Vienne, Guigue the Old, and Guigue Dauphin, who succeeded his father as Guigue IX (IV). This name Dauphin first appears in texts in 1110. It probably had a religious significance according to the Greek poets the dolphin carried the souls of the just to the Fortunate Islands, and the dolphin figures on early Christian sarcophagi as an emblem of immortality. Guigue IX's descendants were thereafter given all the same surname. But by the beginning of the 13th century it came to be mistaken for a title (in 1222 the count of Albon wrote 'ego Andreas, Delphinus et comes Albionis'), and Humbert de la Tour du Pin, son in law of John Dauphin of Albon, made it official, styling himself 'dauphin of the Viennois' (*delphinus Viennensis*).

The county then became Dauphiné (*Delphinatus*, 1285). Humbert II, however, sold Dauphiné in 1349 to Charles of Valois, who on becoming king of France as Charles V transferred it to his eldest son, after which the eldest son of the French was always either actual or titular dauphin of the Viennois.

The eldest son of the French king was sometimes called 'the king dauphin' (*le roy dauphin*), to distinguish him from the dauphin of Auvergne, who was known, since Auvergne became an appanage of the royal house, as 'the prince dauphin.' The dau-

phinate of Auvergne, which is to be distinguished from the county, d'ites from 1155, when William VII, count of Auvergne was deposed by his uncle William VIII. William VII had married a daughter of Guigue IX Dauphin, after whom their son was named Dauphin (Delphinus).

The name, as in the Viennois, appears first as a title in the 13th century (1281). In 1428 the dauphinat was brought into the French royal house by marriage. It was annexed to the crown in 1693.

See G. de Manteyer, *Les Origines du Dauphin de Viennois* (Gap, 1925) (M. Pac., X).

DAUPHINÉ, one of the old provinces (the name being still in current use in the country) of prerevolutionary France, in the southeast portion of France, between Provence and Savoy, after 1790 it formed the departments of the Isère, the Drome and the Hautes Alpes. For the origin of the name see DAUPHIN.

After the death of the last king of Burgundy, Rudolph III, in 1032, the territories known later as Dauphiné (as part of his realm) reverted to the far distant emperor Henry III. Much confusion followed, out of which the counts of Albon (between Valence and Vienne) gradually came to the front (see DAUPHIN). The first dynasty ended in 1162 with Guigue X (V as count of Viennois), whose daughter and heiress, Beatrice, carried the possessions of her house to her husband, Hugh III, duke of Burgundy. Their son, Andre, continued the race, this second dynasty making many territorial acquisitions, among them (by marriage) the Embrunais and the Gapençais in 1232. In 1282 the second dynasty ended in another heiress, Anne, who carried everything to her husband, Humbert, lord of La Tour du Pin (between Lyons and Grenoble). The title of the chief of the house was count (later dauphin) of the Viennois, not of Dauphiné. Humbert II (1333-49), grandson of the heiress Anne, was the last independent dauphin, selling his domains in 1349 to Charles of Valois, who on his accession to the throne of France as Charles V bestowed Dauphiné on his eldest son, and the title was borne by all succeeding eldest sons of the kings of France. In 1422 the Diois and the Valentinois, by the will of the last count, passed to the eldest son of Charles VI and in 1424 were annexed to the Dauphiné Louis (1440-61), later Louis XI of France, was the last dauphin to occupy a semi-independent position, Dauphiné being annexed to the crown in 1456. The suzerainty of the emperor (who in 1378 had named the dauphin "imperial vicar" in both Dauphiné and Provence) gradually died out. In the 16th century Dauphiné was much affected by the wars of religion, Protestantism having been spread first by the teaching of Guillaume Farel, then by the resistance of armed leaders. Of the latter the best known were the baron des Adrets and duc de Lesdigueres (1543-1626), whom Henry IV appointed governors of the country once religious peace had been restored. The "estates" of Dauphiné were suspended by Louis XIII in 1628, but their unauthorized meeting (on July 21, 1788) in the castle of Vizille, near Grenoble, was one of the earliest premonitory signs of the great French Revolution of 1789. It was at Lafayette, near Grenoble, that Napoleon Bonaparte was first acclaimed (March 7, 1815) by his old soldiers sent to arrest him.

(W A B C, X)

DAURAT or DORAT, JEAN (in Lat. AURATUS) (1508-1588), French poet and scholar, and member of the Pleiade, was born at Limoges. His name was originally Dinemand. He belonged to a noble family, and, after studying at the college of Limoges, went to Paris to be presented to Francis I, who made him tutor to his pages. As a private tutor in the house of Lazare de Baif, he had J. A. de Baif for his pupil. His son, Louis, showed great precocity, and at the age of ten translated into French verse one of his father's Latin pieces, his poems were published

with his father's. After the death of Lazare de Baif in 1547 Jean Daurat became the director of the Collège de Coqueret, where he had among his pupils, besides Baif, Ronsard, Remy Belleu and Pontus de Tyard. Joachim du Bellay was added by Ronsard to this group, and these five young poets, under the direction of Daurat, formed a society for the reformation of the French language and literature. They increased their number to seven by the initiation of the dramatist Etienne Jodelle, and thereupon they named themselves La Pléiade, in emulation of the seven Greek poets of Alexandria. The election of Daurat as their president proved the weight of his personal influence, and the value his pupils set on the learning to which he introduced them, but as a writer of French verse he is the least important of the seven. Meanwhile he collected around him a sort of academy, and stimulated the students on all sides to a passionate study of Greek and Latin poetry. He himself wrote incessantly in both those languages, and was styled the Modern Pindar. His influence extended beyond the bounds of his own country, and he was famous as a scholar in England, Italy and Germany. In 1556 he was appointed professor of Greek at the Collège Royal, a post which he continued to hold until, in 1567, he resigned it in favour of his nephew, Nicolas Goult. Charles IX gave him the title of *poeta regius*. His flow of language was the wonder of his time, he is said to have composed more than 15,000 Greek and Latin verses. The best of these he published at Paris in 1580 as *J. Aurati Lemovici poetae et interpretis regii poemata*. He died in Paris on Nov. 1, 1588, having survived all his illustrious pupils of the Pleiade, except Pontus de Tyard. He was a little, restless man, of untiring energy, rustic in manner and appearance. His unequalled personal influence over the poets of his age gives him an importance for which his own writings do not fully account.

The *Oeuvres poétiques* in the vernacular of Jean Daurat were edited (1875) with biographical notice and bibliography by Ch. Marty-Laveaux in his *Pléiade française*.

DAVAO, a well laid out chartered city (with administrative centre and 7 barrios or districts), and capital of the Province of Davao, Mindanao, Philippine Islands, located on the Gulf of Davao, at the mouth of the Davao river, about 800 mi. from Manila. Pop. (1939), 95,546, of whom 170 were whites, 14,181 Japanese and 2,234 Chinese. An unusually high grade of abaca (Manila hemp) is produced and exported from the surrounding country, as well as copra, but it was the former which attracted the Japanese when its price rose to new levels during World War I. Concentrating there and then, they were by 1939 dominating the city, the hemp market, pearl fishing and other industries. It was quite natural, therefore, for the Japanese to make Davao one of their landing places in their invasion of December 1941. The native population consists of Bisayans, Mandayans, Bagobos and Moros. Of those aged 6 to 19, 32.1% in 1939 attended school and of those ten years old and over 55.8% were literate.

DAVENANT, CHARLES (1656-1714), English economist, eldest son of Sir William Davenant, the poet, was born in London, and educated at Cheam grammar school and Balliol college, Oxford. He was member of parliament successively for St. Ives, Cornwall, and for Great Bedwyn. He held the post of commissioner of excise from 1683 to 1689, and that of inspector-general of exports and imports from 1705 till his death in 1714. He was also secretary to the commission appointed to treat for the union with Scotland. His most important works were *Ways and Means of supplying the War* (1695), *An Essay on the East India Trade* (1697), *Two Discourses on the Public Revenues and Trade of England* (1698), *An Essay on the probable means of making the people gamers in the balance of Trade* (1699), *A Discourse on Grants and Resumptions and Essays on the Balance of Power* (1701).

See his *Works* edited by C. Whitworth (1771).

DAVENANT or D'AVENANT, SIR WILLIAM (1606-1668), English poet and dramatist, was baptized on March 3, 1606, he was born at the Crown Inn, Oxford, of which his father, a wealthy vintner, was proprietor. It was stated that Shakespeare always stopped at this house in passing through the city of Oxford, and out of his known or rumoured admiration of the hostess, a

very fine woman, there sprang a story which attributed Davenant's paternity to Shakespeare, a legend which there is reason to believe Davenant himself encouraged. After a brief stay at Lincoln college, Oxford, Davenant became a page to the duchess of Richmond, and then entered the household of Fulke Greville, Lord Brooke. After Brooke's death he turned to the stage, his first play, *Albion, King of the Lombards*, being produced in 1639. Other plays and masques followed, the most important of which was *The Wits*, licensed in 1633 and published in 1636. Davenant was high in favour at court, and succeeded Ben Jonson as poet laureate. Throughout the civil war Davenant supported the king. He joined Henrietta Maria in France, and was sent by her on more than one mission to England. He fought at the siege of Gloucester (1643), after which he was knighted, and returned to Paris after the battle of Naseby. He was captured by the Parliamentarians more than once. In 1650 he was at the head of a colonizing expedition to Virginia which was intercepted in the Channel. He was interned at Cowes until 1651 and was sent to the Tower to await trial for high treason. He solaced his imprisonment by the composition of his epic poem, *Gondibert*, and was released, it is said, on the personal intercession of Milton, for whom he interceded in his turn after the Restoration.

Davenant had been manager of the Drury Lane theatre when the Puritan regime put an end to dramatic performances. In 1656 he contrived to evade the law by giving semi-private representations in private houses. The first of these productions was *The First Day's Entertainment at Rutland House* (May 21, 1656), speeches for and against the drama with declamation and music. The famous *Siege of Rhodes* (Aug. 1656) followed. This was not, as sometimes stated, the first occasion in which changes of scenery were employed and women appeared on the stage, but it does mark the beginning of the change from the ancient simplicity of the English stage. To this performance was given the name "opera." In 1658 Davenant was permitted to open the Cockpit theatre in Drury Lane for historical drama, though not without some protest from Puritan sources. In 1659 he was imprisoned for complicity in the rising of Sir George Booth. At the Restoration Davenant and Killigrew received a patent to set up two companies of players, and Davenant's company became known as the duke of York's players, housed at first in Lincoln's Inn Fields. There were performed many "musical plays," and the theatre became known as the "opera."

The duke of York's players produced some of Davenant's pre-Commonwealth plays in a revised form, notably *Love and Honour* (1649), *The Wits* and *The Platonic Lovers* (1636), but many plays of Shakespeare, Jonson and Fletcher were "adapted," with considerable freedom, by Davenant for the Restoration stage. He also produced versions of various French plays. Davenant died on April 7, 1668, and was buried in Westminster abbey.

His works were collected in folio in 1673. See the edition of his *Dramatic Works*, with prefatory memoir and notes, by J. Maidment and Logan (1872-74).

DAVENPORT, CHARLES BENEDICT (1866-1944), American zoologist, was born at Stamford, Conn., on June 1, 1866. He graduated in 1886 at Brooklyn Polytechnic institute and, in 1889, at Harvard, from which in 1892 he received the degree of doctor of philosophy. After serving as assistant and instructor in zoology at Harvard in 1888-99, he was assistant and associate professor of zoology and embryology in the University of Chicago from 1899 to 1904 when he was made director of the station (at Cold Spring Harbor, L.I., N.Y.) for experimental evolution of the Carnegie Institution of Washington, in which he became the director of the eugenics record office and of the department of genetics (1904-34). He made valuable investigations in the breeding of animals, and in the heredity of eye, hair and skin color, and of temperament, stature and build in man. Among his published works are *Experimental Morphology* (1897-99), *Statistical Methods in Biological Variations* (2nd ed. 1904), *Inheritance in Poultry* (1906), *Eugenics* (1910), *Heredity in Relation to Eugenics* (1911), *Heredity of Skin Color in Negro-White Crosses* (1913), *The Feebly-Inhibited—Nomadism and Temperament* (1915), *Defects Found in Drafted*

Men (1920), *Body Build and Its Inheritance* (1923), and *How We Came by Our Bodies* (1936). He died Feb. 18, 1944, at Huntington, L.I.

DAVENPORT, EDWARD LOOMIS (1816-1877), American actor, born in Boston, made his first appearance on the stage in Providence in support of Junius Brutus Booth. Afterwards he went to England, where he supported Mrs. Anna Cora Mowatt (Ritche) (1819-70), Macready and others. In 1854 he was again in the United States, appearing in Shakespearean plays and in dramatizations of Dickens's novels. As Bill Sikes he was especially successful and his Sir Giles Overreach and Brutus were also greatly admired. He died at Canton, Pa., on Sept. 1, 1877. In 1849 he had married Fanny Vining (Mrs. Charles Gill) (d. 1891), an English actress also in Mrs. Mowatt's company.

His daughter FANNY (LILY GIPSY) DAVENPORT (1850-1898) appeared in America at the age of 12 as the king of Spain in *Faint Heart Never Won Fair Lady*. Later (1869) she was a member of Daly's company, and afterwards, with a company of her own, acted with especial success in Sardou's *Pedra* (1883), *Cleopatra* (1890) and similar plays. Her last appearance was on March 25, 1898, shortly before her death.

DAVENPORT, ROBERT (fl. 1623-1639), English dramatist, of whose life nothing is known. Three plays of his have survived, *King John* and *Matilda* (printed 1655), and two comedies, *The City Nightcap*, (licensed in 1624, but not printed until 1661), and *A New Trick to Cheat the Devil* (printed 1639). Other plays entered in the Stationers' Register as Davenport's are lost, including one called *Henry I* and *Henry II* (1653), the second part of which was said to be the work of Davenport and Shakespeare.

Davenport's plays were reprinted by A. H. Bullen in *Old English Plays* (new series, 1890). The volume includes two didactic poems, which first saw the light in 1623.

DAVENPORT, the third largest city of Iowa, U.S.A., on the Mississippi river, opposite Rock Island and Moline, Ill., the county seat of Scott county. It is on federal highways 6, 61 and 67, and is served by the Chicago, Burlington and Quincy, the Chicago, Milwaukee, St. Paul and Pacific, the Chicago, Rock Island and Pacific, and the Davenport, Rock Island and Northwestern railways, and by bus lines and barges. Land area 18.1 sq. mi. Pop. (1950) 73,640. Davenport has a beautiful location on the slope of a bluff, rising to an altitude of 561 ft. above sea level, and commanding extensive views of landscape and river scenery. There are 18 parks (one along the river front), covering 820 ac., and including two municipal golf courses, a bathing beach, tennis courts, baseball diamonds and a zoological garden. The assessed valuation of property in 1949 was \$66,745,055. Davenport has ten public grade schools, three junior high, one senior high and 11 parochial schools, St. Ambrose college for young men, Marycrest college for young women, the American Institute of Commerce and the Palmer School of Chiropractic. Davenport is an Episcopal see of the Roman Catholic and the Protestant Episcopal churches. It has a large commerce, by rail and by water, shipping especially great quantities of grain and oil, and has important manufactures, including freight cars, gondolas, ready-cut houses, flour, cereal products, candy, bakery goods, cement, washing machines and agricultural implements. The output of its factories in 1949 was valued at \$62,000,000.

On an island in the Mississippi river opposite the city, Rock Island arsenal is the largest government arsenal in the world, with 1,000 ac. Davenport was founded in 1835, under the leadership of Col. George Davenport. It was incorporated as a town in 1839 and as a city in 1851. The first bridge across the Mississippi was built at this point in 1853.

DAVENTRY (pronounced dān'trī or dāv'ən-trī), a market town and municipal borough in the Daventry parliamentary division of Northamptonshire, England, 73½ mi. NW from London on a branch of the LMSR from Weedon. Population (1938) 3,703. Area 5 sq. mi. Daventry is situated on a sloping site in a rich undulating country. The parish church of Holy Cross was rebuilt in 1752. Borough hill, adjoining Daventry, is the site of a vast ancient earthwork, more than two miles in circumference and en-

closing a superficial area of 150 ac. Other remains have been found at Burnt Walls in the vicinity, Watling street passes close by. Daventry grammar school (1576), enlarged and modernized, is a mixed secondary school under the county council. The chief industry of the town is the manufacture of boots and shoes. The making of whips is an extinct craft. Daventry became an important wireless centre after 1925, when the British Broadcasting corporation established on Borough hill a high power station (5 XX) which assumed the functions formerly performed through Chelmsford. In 1927 a second station (5 GB), largely for experimental purposes was installed, but it also took the place of an earlier Birmingham station (IT) for the broadcasting of alternative programs. These two stations were superseded by others, including a high power short wave station for overseas broadcasts. The outbreak of World War II, with a consequent increase in the amount of overseas broadcasts, accelerated the steady development of this wireless centre. Power is derived from Northampton through an electricity substation built in 1925 to supply Daventry.

The large commercial post office station at Hillmorton, near Rugby, is visible from Borough hill. The borough of Daventry is under a mayor, 4 aldermen, 22 councillors, and has a court of summary jurisdiction.

Nothing is known of Daventry itself until the time of the Domesday Survey, when the manor consisting of eight hides was held by the countess Judith, the Conqueror's niece, as the widow of Wulfhelm, the last native earl of Northumbria, who at the Conquest held the great midland earldom of Huntingdonshire and Northamptonshire. Before the end of the century it had passed to Simon de St. Liz, whose grandson, Walter Fitz Robert, held 'of the fee of the king of Scotland,' who had become possessed of the earldom of Huntingdon (see HUNTINGDONSHIRE and NORTHAMPTONSHIRE). Daventry was created a borough by King John, who granted to Simon, son of Walter, a market on Wednesday and a fair on St. Augustine's day. But there is no extant charter before that of Elizabeth in 1576, by which the town was incorporated under the name of the bailiff, burgesses and commonalty of the borough of Daventry. James I confirmed this charter in 1605-06, and Charles II in 1674-75 granted a new charter. The corporation was reconstituted in 1855. During the civil wars Daventry was the headquarters of Charles I immediately before the battle of Naseby. He is supposed to have slept at the Wheat Sheaf inn. The last remains of the Cistercian priory endowed by Simon de St. Liz were removed during the 19th century.

The pronunciation of Daventry as "Dane-tree," which is sanctioned by ancient local usage (cf. Shakespeare's "Daintry," *Henry VI*, pt. iii, act V), is referred by tradition to the building of the town by the Danes. Though the written element affords no definite proof of early pronunciation, the spelling "Daventree" in Domesday is explicit, and in the legend of a seal of the Prior Nicholas (1231-64) reads "Davitree" (*Victoria County History, Northampton*, vol. II).

DAVEY OF FERNHURST, HORACE DAVEY, BARON (1833-1907), English judge, son of Peter Davey, of Horton, Bucks, was born on Aug. 30, 1833, and educated at Rugby and University College, Oxford. In 1861 he was called to the bar, and in 1875 became a Q.C. In 1880 he was returned to parliament as a Liberal, but lost his seat in 1885. On Gladstone's return to power in 1886 he was appointed solicitor general and was knighted, but had no seat in the House, being defeated at both Ipswich and Stockport in 1886, in 1888 he found a seat at Stockton-on-Tees, but lost it in 1892. As an equity lawyer Sir Horace Davey ranked among the finest intellects and the most subtle pleaders ever known at the English bar. He was standing counsel to the University of Oxford, and senior counsel to the Charity Commissioners. Among the cases in which he was engaged were the *Mogul Steamship Case* (1892), the trial of the bishop of Lincoln, and the *Berkeley Peerage Case*. In 1862 he married Miss Louisa Donkin, who, with two sons and four daughters, survived him. In 1893 he was raised to the bench as a lord justice of appeal, and in the next year was made a lord of appeal in ordinary and a life peer. He died in London on Feb. 20, 1907.

DAVID, ST., the patron saint of Wales, whose feast falls on March 1. Few historical facts are known regarding the saint, although there is reason to suppose he was born c. 500 and died c. 600. According to his various biographers he was the son of Sandde, a prince of the line of Cunedda, his mother being Non, who ranks as a Cymric saint. He seems to have taken a prominent part in the celebrated synod of Llandewi Brefi (see CAPEDEGANSTRE), and to have presided at the so-called "Synod of Victory" held later at Caerleon on-Usk. At some date unknown, St. David, as *pen eschol*, or primate of South Wales, moved the seat of ecclesiastical government from Caerleon to the remote headland of Mynyw or Llŷnvaia, which is still under the name of St. David's (*Ty Dewi*). The cathedral city of the western sea. St. David founded numerous churches throughout South Wales (53 still recall his name) but apparently he never penetrated farther north than the region of Powys, although he seems to have visited Cornwall. His shrine at St. David's became a notable place of pilgrimage, and at Henry I's request he was formally canonized by Calixtus II about 1120.

The earliest known biography is that of Rhygyfarch (d. 1099), one of the last British bishops of St. David's, from whose work Geraldus Cambrensis (q.v.) chiefly compiled an extravagant life. Rhygyfarch's *Life* has been edited with a translation by A. W. Wade Evans (1914). See also *Catalogue of MSS.*, books, etc., relating to St. David, the cathedral church of St. David's, etc. (Cardiff, 1927).

DAVID, king of Judah and Israel, was the founder of the Judaean dynasty at Jerusalem. The exact date of his reign is uncertain. It used to be reckoned from 1055-1015 B.C., but is now generally fixed at about 1010-970 B.C. Our principal source for his history is 1 Sam. xvi-1 Kings ii. Its very extent shows how deep was the impression he made upon the mind of his people, indeed, his popularity as a national hero is one cause of the difficulty we find in reconstructing his history. Stories of exploits and incidents in his career were repeated with delight from generation to generation. Groups of these stories were collected together, and from several such sources the history of his doings was compiled. The editors have pieced their material so well together, however, that it is impossible for us to separate it with accuracy into its constituent sources. But the harmonizing has not been perfectly carried out, and the inconsistencies and duplications have enabled the critics to separate more or less clearly at least two main sources. The Greek text, again, varies very considerably from the Hebrew, offering a different collection of the narratives. For detailed discussion of these problems the commentaries on Samuel, and SAMUEL (BOOKS OF) should be consulted. Another history of David is to be found in 1 Chron. vi-xxix, which is to some extent parallel to that in Samuel but omits many of the narratives. On the other hand it contains much additional material, which is, however, of inferior historical value. It is much fuller on subjects which were the special concern of the editor of Chronicles, such as details of temple arrangements and lists of officers. It is particularly interesting because of its obvious tendency to idealize the character of David, and in this respect was the late stage of a process which must have begun soon after the death of the national hero, and of which we find traces even in Samuel.

The history in Samuel opens with an account of the anointing of David by Samuel as successor to Saul, whom Yahweh had rejected from the throne of Israel (1 Sam. xvi. 1-13). Samuel is instructed that the new king is to be found among the sons of Jesse, who dwells at Bethlehem, 6 m. south of Jerusalem. A sacrifice is celebrated there, to which, beside Jesse and his sons, the elders of the town are invited. David, busy in tending the sheep, is apparently too young to be summoned with his older brothers. But when the oracle rejects each of the seven elder brothers Samuel asks whether there is no other son, and David is summoned. It is made clear that he is the chosen one, and Samuel anoints him. This narrative, which is seemingly rather the conclusion of Samuel's history than the beginning of David's, raises suspicions. It will be noted that in 1 Sam. xvi. 13 *seg.* the brothers of David are three in number (v. 12 is harmonistic), not seven, and in 1 Chron. ii. 13-15, six. It is highly improbable that the ceremony could have been performed without some news of it to the ears of Saul, and the later narratives seem to ignore

Introduction to Saul—1 Sam xvi 14-23 gives an account of David's introduction to the court of Saul. One of the king's attendants, when a man is sought who can play the harp to charm the moods of melancholy which have fallen upon Saul, recommends David, whom he describes not merely as a good harpist, but as 'a mighty man of valour, and a man of war'—a description difficult to reconcile with the preceding narrative unless a considerable number of years be supposed to intervene. David is summoned, and his manly beauty appeals to Saul, who makes him not only court harpist but also his own armour bearer.

The next section of the history in Samuel (xvi 1-xviii 5) records the most famous exploit of David, his victory in single combat over the Philistine giant Goliath, and its consequences. This account, however, raises several serious difficulties. First of all there is the fact that in 2 Sam xxi 19 the slaying of Goliath is attributed to Elihanan, one of David's heroes. An attempt to reconcile these contradictory statements is found in 1 Chron xx 5 where the victim of Elihanan's valour is described as 'Lahmi, the brother of Goliath.' David's exploit is not referred to in 1 Sam xxi 10-15, or in xxix, where some reference to it would have been expected, and on these and other grounds the simpler tradition of 2 Samuel is usually preferred. On the other hand, it may well have been some such valiant deed that first attracted Saul's attention to David (cf xiv 52), and accounted for the popularity of the latter which made him an object of jealousy to Saul. Hence the narrative of 1 Sam xvi, though legendary, may be the expanded version of some historic combat in which David's opponent was not Goliath. Much more serious is the impossibility of reconciling the narrative with what precedes. Although according to xvi Saul has already appointed David to be his musician and armour bearer, now David appears as an untired shepherd lad, sent by his father with provisions for his brothers in the Israelite camp. His brothers treat him with a petulance hardly conceivable if he already stood well at court, and vv 55-58 show that neither Saul nor his captain Abner had ever heard of David before. Some light is thrown upon this difficult problem by a study of the Greek versions, in one group of which, represented by the Vatican text, xvi 12-31, 47, 50, and xvii 55-xviii 5 are missing. This shorter form of the tradition is more than intelligible, and more easy to reconcile with xvi. It will be seen at once that xvi 32 follows xvi 11 much more naturally than does v 12. Whether the Greek or the Hebrew text is original is a much-debated problem, but on the whole it is more likely that the additional verses in the latter are expansions, taken from another biography of David, than that the Greek is an abbreviated form of the Hebrew. In xvii 1-4 we have the first notice of the friendship that grew up between Jonathan, Saul's son, and David. The investment of David in the apparel of Jonathan may be an alternative to the exchange of blood as a symbol of brotherhood, for the clothes of a man were regarded as in a sense part of his personality. Otto Lussfeldt, however, has argued plausibly (*Theologische Blätter*, Oct 1927) that this is part of a parallel tradition according to which David was armour-bearer and favourite, not of Saul, but of Jonathan, a theory which would explain some difficulties in the later narratives.

Conflicts with Saul—But now Saul becomes jealous of David, because he is the popular idol and his exploits are extolled beyond those of the king. The development of this jealousy is described in the shorter Greek version of xvi according to which Saul removes David from personal attendance at the court and makes him captain of a thousand soldiers. In his new position he is very successful and his popularity increases, so that Saul becomes more alarmed than ever. Michal, Saul's daughter, falls in love with David and Saul promises him her hand if he will attempt an almost impossible task of valour, hoping that he may be killed in the attempt. David succeeds brilliantly and slays the king's daughter's suitor, but when he returns home he is welcomed by his father and the king's daughter. Saul's anger now becomes a fierce hatred, and he proposes to Jonathan and the court the assassination of David (xvi 11). The additional matter in the Hebrew, which includes the incident—a double of xix 9 seq.—of Saul's attempt to murder David, and his unfulfilled promise to give his daughter Merab to him, destroys the psychological truth of the narrative. The breach between Saul and David was made up, for a time, by Jonathan

(xix 2-7), but further successes of David in war reawaken the dormant hatred of Saul, who hurls a spear at David, which the latter evades. The story of Saul's attempt to have David assassinated in the house where he dwelt with Michal (xv 11-17), which bears all the marks of truth, is out of place here, when David has already fled (v 10), and may possibly be connected with xvii 27 (see H. P. Smith in the *International Critical Commentary*).

Chapter xv, which records the covenant made by Jonathan with David and prepares the way for the story of David's kindness to Jonathan's son Meribael seems to be independent of the traditions in which it is embedded, and has been expanded by the additional interview between the two friends, vv 40-42. It certainly cannot follow on xix 18-24, the story of David's attempt to find sanctuary with Samuel at Ramah, for it supposes David to be still at court and Jonathan to be unaware that David stands in peril. This flight of David's may possibly be fitted in after xix 9, xxi 1 as an ineffective attempt to remove the difficulty. Next David goes to the sanctuary at Nob, where he had been wont to consult the priestly oracle (xv 15), and, pretending that he is engaged on a secret expedition in Saul's behalf, obtains of Ahimelech the priest bread from the sacred table and the sword of Goliath. This narrative may well follow xxi 10, the incident of David's escape from the spear hurled at him by Saul. The story goes on to relate the flight of David to the court of the Philistine king of Gath, Achish, where he escapes from the revenge which might otherwise have been taken upon him by feigning madness (xv 10-15). This anticipates xvii, and is out of place at this point of the history, surely David would not go to the very city of Goliath flaunting the sword of the giant!

Outlaw Life—For years after his escape David lived the life of an outlaw. He made his headquarters first at the stronghold—the traditional "cave" is a mistake—of Adullam, a Canaanite town said to have been captured by Joshua (Josh xi 15), probably on the western border of Judah, and about 12 miles from Bethlehem. Here he was joined by his clansmen and by others who were in a desperate position, such as those who feared to be sold into slavery for failure to pay their debts, until his band numbered 400 men. A probably secondary tradition xxi 3 seq., relates that he placed his father and mother under the protection of the king of Moab. The following verse, which speaks of the seer Gad as in the company of David, is also probably a later tradition. Saul was discontented at this new development. His hated rival had escaped his clutches, largely through the connivance of his son. An Edomite, Doeg, who had been a concealed witness of the interview at Nob between Ahimelech and David, reported what had happened there, and Saul sent for Ahimelech. In spite of Ahimelech's protest that he had acted in all good faith with Saul, the king commanded that he and all the other priests of the sanctuary should be slaughtered. His bodyguard refusing to carry out this command, he ordered the informer to act as executioner, and Doeg slew 85 priests of Nob—a suspiciously large number. All living creatures in that town were also put to death, save Abiathar, one of Ahimelech's sons, who escaped and took refuge with David.

Presently word was brought to David that the Philistines were raiding Keilah, south of Adullam, and, despite the reluctance of his followers to undertake so desperate an enterprise, the outlaw chief, encouraged by a priestly oracle, defeated the Philistines and delivered Keilah. Probably he manacled his hand by acting at once, as prophesied of the diviner-general, such as the capture of the camp on the part of the Philistines and the recovery of Saul as an opportunity of capturing David which he was away from the protection of his stronghold and prepared to besiege him in Keilah. But David was told by the oracle that the men of Keilah would deliver him up to Saul if he remained within their walls. Desperately he fled, but he had now grown to 600 men. David lived now in the hunted outlaw, wandering from stronghold to stronghold in the border country. Popular tradition tells in xxi, xiv, xvi, of a visit of consolation from Jonathan, the attempt of the men of Ziph to betray David to Saul, and of David's magnanimity in sparing Saul's life when it was in his power to kill him, the two latter incidents appearing in duplicate. The incident of David's marriage to Abigail, the wife of a rich farmer who died a few days after he

had churlishly refused to pay David the levy for protection as for him (xxv), is important as showing how David maintained his band, and how he strengthened his position by matrimonial alliances (cf. xxv 43).

Wearied at last of his precarious life he decided to place himself under the protection of Achish, the Philistine ruler of Gath, from whom he obtained permission to establish himself and his band at Ziklag, which probably lay to the south of Judah. Here for more than a year he maintained his troop by raids upon the Amalekites and other marauding Bedouins. According to the rather improbable story of xxvii 10-12 he represented these to Achish as raids upon Judah, as though to give proof of his permanent alienation from his own people. In any case Achish was convinced of David's loyalty and took him and his band as part of the army which he led in an important campaign against Saul. But on the eve of battle the Philistine captains, more distrustful than their leader, persuaded Achish to order David's return to Ziklag. David reached Ziklag to find that in his absence the Amalekites had raided and burned the town, carrying off with other booty David's wives. Pursuing the marauders he inflicted upon them a signal defeat, recovering all that had been carried off and much spoil in addition. By distributing a part of his spoil among the rulers of the various towns in the south country and of the old haunts of his freebooting days he strengthened his hold upon the affections of that countryside. In the meantime the Philistine campaign against Israel had been successful, and Saul and his sons, including Jonathan, lay dead upon the slopes of Mt. Gilboa. The fertile lowlands of Jezreel and the Jordan fell into the possession of the victors, and Saul's son Ishbaal, who had escaped the fate of his brothers, maintained a shadowy sovereignty in the remote city of Mahanaim, the force behind his throne being Abner, Saul's commander-in-chief. The news of Israel's defeat and Saul's death is brought (2 Sam. i) to Ziklag by an Amalekite, who claims—in contradiction to the account in 1 Sam. xxxi 4—to have slain the wounded king, and offers to David the crown and bracelet which he had taken from the corpse. Instead of receiving the reward which he doubtless looked for the messenger is slain at the command of David, who utters the noble dirge on Saul and Jonathan, 2 Sam. i 19-27. The compiler avowedly takes the poem from the "Book of Jashar," but there appears to be no cogent reason for denying that David is its author.

King at Hebron.—David now takes a further step in his advance towards the throne, for, in response to a Divine oracle, he establishes his household and his band in Hebron, where, at the age of 30 (if 2 Sam. v 4 may be trusted), he is anointed king by the Judean clans. There he reigned, according to the statement of ii 11, seven and a half years. His position as established ruler of an important town, on friendly terms with the neighbouring sheikhs, and allied by marriage with the families of Caleb and Jezreel (in Judah), was well secured. Further such marriages are recorded in iii 3-5. It is quite in keeping with the constant tradition of David's chivalrous treatment of Saul that he should have sent a message of appreciation to the men of Jabesh Gilead for their pious act in burying the bodies of Saul and his sons, ii 46 seq., and with his skilful diplomacy that the messengers should hint that Jabesh Gilead might do well to transfer its allegiance to himself—a hint which was for the time being ignored.

A conflict between the forces of Ishbaal, under Abner, and those of David, under Joab, which developed out of a contest between 12 picked men on either side, ended greatly to the advantage of David's men. In the course of the struggle Abner slew Asahel, Joab's brother, thus creating a blood feud which had serious consequences in the subsequent history. Abner, recognizing that the cause of Ishbaal was hopeless, took to himself one of Saul's concubines, an infringement of Ishbaal's prerogative as Saul's successor, with deliberate intent to raise a quarrel with his lord which might provide him with a pretext for transferring his allegiance to David. When Ishbaal protested Abner sent an embassy to David offering to bring the northern clans over to him. According to one story (iii 12-16), David demanded the return of Michal to him, as an evidence of good faith, but this story is consistent neither with itself nor with its context. In any case Abner, returning

from Hebron after arranging terms with David, was summoned back by Joab and treacherously slain in pursuance of the blood-feud. David was indignant, and showed his indignation by according burial to Abner and proclaiming a fast. Apparently Joab was both too strong and too useful for the king to punish him, so David handed over that task to his God. The position of Ishbaal, deprived of Abner's help, went from bad to worse, and he was eventually assassinated by two of his own followers. They brought his head to David, but received the same reward as the Amalekite who thought to have found favour with David by his claim to have killed Saul. Following this the northern tribes swore allegiance to David at Hebron, and he became king of the united peoples. Here we may place the two successes over the Philistines narrated in v 17-25.

Capture of Jerusalem.—Another important stage in David's career was marked by the capture of Jerusalem, an ancient Jewish stronghold which had never been in Hebrew hands. Regarded as impregnable by its inhabitants, who treated David's threat with derision, it was captured by the ascent of a shaft which had been pierced through the rock to afford the city a water supply. The stronghold was further fortified by David, who built himself a cedarwood palace, the materials and artificers for which were furnished by Hiram, king of Tyre—another indication of David's growing importance. David also enlarged his harem.

The king now turned his attention to the ark of Yahweh, which had remained in obscurity since its return from the Philistines in the early youth of Samuel. It was brought up from Baal of Judah, and, after having been temporarily housed with Obed Edom owing to an untoward incident during its progress, was placed in a specially prepared pavilion in the citadel, amid great rejoicings. That the king should have proposed to build a temple worthy to stand beside his palace is quite natural, and ch. vii, which relates how Nathan the prophet, after first sanctioning the project, forbade it in the name of Yahweh, may, though comparatively late, be based on a historical foundation. There follows in viii a summary of military successes achieved by David and Joab, his commander-in-chief. The concluding verses show that the court had been properly organized and a bodyguard of mercenaries provided for the king. The lame Mephibosheth (Meribai), Jonathan's son, was admitted to the royal table as the king's pensioner, and his family estates were restored to his use.

A friendly embassy from David to the newly crowned king of Ammon was treated with insult, and a war ensued, in which the Ammonites, who succeeded in gaining considerable Aramean support, were completely defeated, and their chief city was captured by David after a siege. It was during this campaign that David began to obtain for himself the beautiful Bathsheba, caused Joab deliberately to abandon her husband, Uriah the Hittite mercenary, to an Ammonite assault. Not only were the Syrian allies of Ammon reduced to submission, but Edom was completely subjugated by Joab.

Internal Troubles.—From this time on David's reign was undisturbed by foreign attack, but, in the absence of necessity for standing together against a common foe, internal troubles developed. In part these proceeded from the king's own household. Absalom, his third son, having contrived the murder of Amnon the eldest, in revenge for an assault upon Absalom's sister Tamar, fled the country and took refuge with his mother's father, Talmai, king of Geshur. After three years Joab satisfied the unexpressed longing of David for his son's return, for which he secured permission by a stratagem. Absalom was excluded from the court for two years, and when David was fully reconciled to receive him began to plot against his father. He succeeded in creating a party for himself, and after some four (so read in xiv 7) years raised the standard of revolt in Hebron. David was compelled to flee in haste to Gilead, abandoning Jerusalem to Absalom. The first battle between the forces resulted in the total defeat of Absalom, who was slain, against the express command of David, by Joab. David was welcomed back by the people, but the northern tribes resented the precedence which was claimed by Judah on the ground of kinship to the king. This discontent manifested itself in a rebellion headed by Sheba, a Benjamite, who eventually threw

self into the walled city of Abel of Beth-Maacah. There he was besieged by David's army under Joab. To avoid the disastrous consequences of a prolonged siege the inhabitants slew Sheba and threw out his head to Joab, who had agreed to draw off his forces on that condition. It should be said that some scholars, e.g., Winckler and S. A. Cook (*Notes on Old Testament History*, pp. 3-17), have argued forcibly that the revolts of Absalom and Sheba should be dated in a much earlier period of David's reign. The remaining chapters of 2 Samuel interrupt the history of David, which is resumed in 1 Kings 1. They contain fragments relative to David which have been inserted here by different editors. The two poetical pieces, 2 Sam xxii 1-xxiii 7, are not Davidic; it will be recognized at once that they interrupt the catalogue of David's heroes and their exploits, which xxiii 8 resumes from xx 22. The story of xxi 1-14, relating how David delivered over to the men of Gibeon seven of Saul's descendants to be impaled, and how, moved by the pathetic fidelity of Rizpah, he gathered the bones of these men and of Saul and Jonathan to be decently interred, is probably historic, though not in its proper chronological order. The story of the census and its disastrous results, xxiv, may possibly come from the same source, though some parts of it may be later insertions.

The closing scenes of David's life, 1 Kings 1-ii 11, show the old warrior enfeebled by age, and the succession to his throne the subject of intrigue. His eldest surviving son, Adonijah, regarded himself as the heir. Like Absalom, he was of great personal charm and a favourite with numbers of the people, his outstanding supporters being Joab and Abiathar. Like Absalom, too, he sought to make his position secure by assuming the state suitable to the heir-apparent. He made a great feast for the men of Judah, inviting the king's sons but deliberately ignoring Solomon, Bathsheba's son, the prophet Nathan, and David's "mighty men," who evidently constituted a party in favour of Solomon's succession. Bathsheba and Nathan contrived to secure from David the ratification of an old promise that Solomon should succeed to the throne, and the aged king roused himself to make arrangements for the formal proclamation of Bathsheba's son. Adonijah's followers were seized with panic, and he himself sought sanctuary by taking hold of the horns of the altar, whence he suffered himself to be removed upon a rather equivocal promise by Solomon that his life should be spared. The remainder of the story records, with some later expansion by a Deuteronomist editor, how David left instructions to Solomon that Joab and Shimei should be put to death, but kindness shown to the family of Barzillai. This ungenerous treatment of Joab, to whom more than to any man he owed the success of his career, and the virtual recantation of his promise to spare Shimei strike an unpleasant note in our ears. Nor does the consideration of the king's failing powers and of his possible fear that Solomon's position might be endangered by adversaries whom he himself had felt free to spare completely mellow its harshness. And so, after a reign of 40 years, David slept with his fathers.

David's Character and Work.—Rightly to estimate the character and work of David we must judge him by the standards of his own day. His military capacity is proved by the uniform success he achieved as commander. Even though the story of his conflict with Goliath may be legendary it undoubtedly gives us the measure of his reputation for personal bravery. To these qualities he added astute diplomacy and far-seeing statesmanship. That at times he resorted to deceit—as, for example, in the employment of Hushai to spy upon the movements of Absalom—is true, but this would be commended by his own age and is reputable even to-day. He knew well how to wait his opportunity, and instead of snatching at the kingship in haste allowed the fruit to ripen until it fell into his hands, all the while strengthening his hold upon his fellow countrymen. His choice of Jerusalem as capital is an excellent example of his wisdom. In seeing it he furnished himself not only with a secure citadel, whose natural strength was shown later by its desperate resistance to Babylonians and Romans, but also with a centre of government not so closely associated with his own tribe of Judah as was Hebron, and one therefore less likely to cause jealousy on the part of northern Israel. His real monument was the united kingdom which he established, its influence stretching

right up into Syria, it was the most powerful empire that ever Palestine produced. True, his opportunity was exceptional, he caused neither Egypt, Assyria, nor Babylon was at the time in a position to challenge his progress, but to have achieved it at all was wonderful. We can readily understand that the Jews of later days looked back to David as the ideal king and pictured the ruler of the happy day for which they hoped as a second David.

David may be charged with harshness in the treatment of conquered peoples—though the true meaning of 2 Sam xii 31 is that he set the people of Rabbah to menial labour, not that he tortured them, but in this respect he compares favourably with his contemporaries. His delivery of Saul's descendants to be impaled was but obedience to the will of Yahweh as he understood it. And on the other hand his record is marked by chivalrous treatment of his foes on several occasions. Even his outstanding faults, the murder of Uriah that he might obtain Bathsheba, and his weakness in dealing with his sons, though we need not palliate them, were less heinous a thousand years before Christ than they would be to-day. He was a sincerely religious man, a devout worshipper of Yahweh, as may be seen from his care for the Ark. Though his relationships with the prophets Gad and Nathan may have been idealized by later editors he certainly was more amenable to prophetic guidance than was Saul. He was assuredly not the soldier-saint of Chronicles, or the Psalmist of profound religious experience. But while it is improbable that he was the author of any of the Hebrew hymns he was undoubtedly a musician and a poet. The dancer of 2 Sam vi would naturally be the singer, too, and there is good reason for believing the elegy on Saul and Jonathan and the little dirge on Abner, 2 Sam in seq 33, are of David's composition. Moreover, the attribution of Psalms to David, though mistaken, is most easily understood if he was really a minstrel (cf. also Amos vi 5).

Greatly loved in his day, deeply revered by those who came after him, David was perhaps the most winsome character in Hebrew story, lovable, because so human, even in his faults. A great warrior and a great statesman, his importance as the real constructor of the Hebrew kingdom can hardly be overestimated.

Cook, *Critical Notes on Old Testament History*, R. Kittel, *Geschichte des Volkes Israels*, ii pp. 108-187, *Gestalten und Gedanken in Israel*, pp. 120-157. (W. R. S., W. L. W.)

DAVID I. (1084-1153), king of Scotland, the youngest son of Malcolm Canmore and (Saint) Margaret, sister of Edgar Aetheling, married in 1113 Matilda, daughter and heiress of Walthof, earl of Northumbria, and thus became possessed of the earldom of Huntingdon. On the death of Edgar, king of Scotland, in 1107, the territories of the Scottish crown were divided in accordance with the terms of his will between his two brothers, Alexander and David. Alexander, together with the crown, received Scotland north of the Forth of Clyde, David the southern district with the title of earl of Cumbria. The death of Alexander I in 1124 gave David possession of the whole. In 1127, in the character of an English baron, he swore fealty to Matilda as heiress to her father Henry I, and when the usurper Stephen ousted her in 1135 David vindicated her cause in arms and invaded England. But Stephen marched north with a great army, whereupon David made peace. The peace, however, was not kept. After threatening an invasion in 1137, David marched into England in 1138, but sustained a crushing defeat on Cutton Moor in the engagement known as the battle of the Standard. He returned to Carlisle, and soon afterwards concluded peace. In 1141 he joined Matilda in London and accompanied her to Winchester, but after a narrow escape from capture he returned to Scotland. Henceforth he remained in his own kingdom and devoted himself to its political and ecclesiastical reorganization. A devoted son of the church, he founded five bishoprics and many monasteries. In secular politics he energetically forwarded the process of feudalization which had been initiated by his immediate predecessors. He died at Carlisle on May 24, 1153.

DAVID II. (1324-1371), king of Scotland, son of King Robert the Bruce by his second wife, Elizabeth de Burgh (d. 1327), was born at Dunfermline on March 5, 1324. In accordance with

the terms of the treaty of Northampton he was married in July 1328 to Joanna (d 1362), daughter of the English king, Edward II, and became king of Scotland on his father's death in June 1329, being crowned at Scone in November 1331. Owing to the victory of Edward III of England and his protégé, Edward Balliol, at Halidon Hill in July 1333, David and his queen were sent for safety into France, reaching Boulogne in May 1334, and being received very graciously by the French king, Philip VI. Little is known about the life of the Scottish king in France, except that Chateau Gaillard was given to him for a residence, and that he was present at the bloodless meeting of the English and French armies at Vronfosse in October 1339. Meanwhile his representatives had obtained the upper hand in Scotland, and David was thus enabled to return to his kingdom in June 1341, when he took the reins of government into his own hands. In 1346 he invaded England in the interests of France, but was defeated and taken prisoner at the battle of Neville's Cross in October of this year, and remained in England for eleven years, living principally in London and at Odham in Hampshire. His imprisonment was not a rigorous one, and negotiations for his release were soon begun. Eventually, in October 1357, after several interruptions, a treaty was signed at Berwick by which the Scottish estates undertook to pay 100,000 marks as a ransom for their king. David, who had probably recognized Edward III as his feudal superior, returned at once to Scotland, but owing to the poverty of the kingdom it was found impossible to raise the ransom. A few instalments were paid, but the king sought to get rid of the liability by offering to make Edward III, or one of his sons, his successor in Scotland. In 1364 the Scottish parliament indignantly rejected a proposal to make Lionel, duke of Clarence, the next king, but David treated secretly with Edward III over this matter, after he had suppressed a rising of some of his unruly nobles. The king died in Edinburgh Castle on Feb. 22, 1371. His second wife was Margaret, widow of Sir John Logie, whom he divorced in 1369, but he left no children, and was succeeded by his nephew, Robert II. David was a weak and incapable ruler, without his father's patriotic spirit. (See SCOTLAND, History)

DAVID, the name of three Welsh princes

DAVID I (d 1203), a son of Prince Owen Gwynedd (d 1169), came into prominence as a leader of the Welsh during the expedition of Henry II in 1157. In 1170 he became lord of Gwynedd (i.e. the district around Snowdon), but some regarded him as a bastard, and Gwynedd was also claimed by other members of his family. After fighting with varying fortunes he sought an ally in the English king, whom he supported during the baronial rising in 1173, after this event he married Henry's half sister Emma. But his enemies increased in power, and about 1194 he was driven from Wales by the partisans of his half-brother Llewelyn ap Iorwerth. The chronicler Benedictus Abbas calls David *rex*, and Rhuddlan castle was probably the centre of his vague authority.

DAVID II (c 1208–1246) was a son of the great Welsh prince, Llewelyn ap Iorwerth, and through his mother Joanna was a grandson of King John. He married an English lady, Isabella de Braose, and, having been recognized as his father's heir both by Henry III and by the Welsh lords, he had to face the hostility of his half-brother Gruffydd, whom he seized and imprisoned in 1239. When Llewelyn died in April 1240, David, who had already taken some part in the duties of government, was acknowledged as a prince of North Wales, doing homage to Henry III at Gloucester. He was soon at variance with the English king, who appears to have espoused the cause of the captive Gruffydd. Henry's Welsh campaign in 1241 was bloodless but decisive. Gruffydd was surrendered to him, David went to London and made a full submission, but two or three years later he was warring against some English barons on the borders. To check the English king he opened negotiations with Innocent IV, doubtless hoping that the pope would recognize Wales as an independent state, but here, as on the field of battle, Henry III was too strong for him. Just after Henry's second campaign in Wales the prince died in March 1246.

DAVID III (d 1283) was a son of Gruffydd and thus a nephew of David II. His life was mainly spent in fighting against his

brother, the reigning prince, Llewelyn ap Gruffydd. His first revolt took place in 1254 or 1255, and after a second about eight years later he took refuge in England, returning to Wales when Henry III made peace with Llewelyn in 1267. Then about 1274 the same process was repeated. David attended Edward I during the Welsh expedition of 1277, receiving from the English king lands in North Wales, but in 1283 he made peace with Llewelyn and suddenly attacked the English garrisons, a proceeding which led to Edward's final conquest of Wales. After Llewelyn's death in December 1282 David maintained the last struggle of the Welsh for independence. All his efforts, however, were vain, in June 1283 he was betrayed to Edward, was tried by a special court and sentenced to death, and was executed with great barbarity at Shrewsbury in October 1283. As the last native prince of Wales, David's praises have been sung by the Welsh bards, but his character was not attractive, and a Welsh historian says "his life was the bane of Wales." (See WALES, History)

DAVID, FÉLICIEN (1810–1876), French composer, was born on April 13, 1810, at Cadénet (Vaucluse). He was a precocious child, and composed a string quartet at the age of 12. He was educated at the Jesuit college at Aix, and became choirmaster at St. Sauveur at Aix for a year. He then studied for a while at the Paris Conservatoire. In 1831 he joined the sect of Saint Simonians, and in 1833 travelled in the Near East in order to preach the new doctrine. After three years' absence he returned to France and published a collection of *Oriental Melodies* for the pianoforte. For several years he worked in retirement, and wrote two symphonies, some chamber music and songs. On Dec. 8, 1844, he suddenly leapt into fame with his symphonic ode *Le Désert*, produced at the Conservatoire. In this work David attained in simple strains to evoke the majestic stillness of the desert. Notwithstanding its title of "symphonic ode," *Le Désert*, has little in common with the symphonic style. What distinguishes it is a certain naïveté of expression and an effective oriental colouring. His succeeding works, *Mossé au Sinai* (1849), *Christophe Colomb* (1847), *L'Eden* (1848), scarcely bore out the promise shown in *Le Désert*. David produced several operas: *La Perle du Brésil* (1851), *Herculanum* (1859), *Lalla-Roukh* (1862), *Le Saphir* (1865). He died at Saint-Germain-en-Laye on Aug. 29, 1876. At a time when the works of Berlioz were still unappreciated by the majority of people, David succeeded in making the public take interest in music of a picturesque and descriptive kind. Thus he may be considered as one of the pioneers of modern French musical art.

See R. Brancour, *Félicien David* (1911), with full bibliography.

DAVID, GERARD [GHEERARDT DAVY] (?–1523), Netherlands painter, born at Oudewater, in Holland, was the last great master of the Bruges school. He was only rescued from complete oblivion in 1860–63 by W. J. H. Weale, whose researches in the archives of Bruges brought to light the main facts of the master's life. David came to Bruges in 1483, presumably from Haarlem, where he had formed his early style under the tuition of Ouwater, he joined the guild of St. Luke at Bruges in 1484, and became dean of the guild in 1501, he married, in 1496, Cornelia Cnoop, daughter of the dean of the Goldsmiths' guild, became one of the leading citizens of the town, died on Aug. 13, 1523, and was buried in the Church of Our Lady at Bruges.

In his early work he had followed the Haarlem tradition as represented by Dirck Bouts, Ouwater and Geertgen of Haarlem, but already gave evidence of his superior power as colourist. To this early period belong the "St. John" of the Kaufmann collection in Berlin, and "St. Jerome" in the Salting collection (National Gallery, London). In Bruges he studied and copied masterpieces by the Van Eycks, Van der Weyden, and Van der Goes, and came under the direct influence of Hans Memling. From him he acquired the intensity of expression, the increased realism in the rendering of the human form and the orderly architectonic arrangement of the figures. In 1515 he visited Antwerp, and became impressed with the life and movement in the work of Quentin Matsys, who had introduced a more intimate and more human conception of sacred themes. David's "Piety" in the National Gallery, and the "Descent from the Cross," in the

Cavallo collection, Paris, were painted under this influence and are remarkable for their dramatic movement. But the works on which David's fame rests most securely are the great altar pieces executed by him before his visit to Antwerp—the "Marriage of St. Catherine," at the National Gallery, the triptych of the "Madonna Enthroned, and Saints" of the Brignole-Sale collection in Genoa, the "Annunciation" of the Sigmaringen collection, and, above all, the "Madonna with Angels and Saints" at Rouen. Of David's pupils in Bruges, only Isenbrandt, A. Cornelis and Ambrosius Benson achieved importance. Among other Flemish painters, Joachim Patinir and Mabuse were to some degree influenced by him.

Eberhard Freiherr von Bodenhausen published in 1905 a very comprehensive monograph on *Gerard David and his School* (Munich, F. Bruckmann), together with a *catalogue raisonné* of his works, which, after careful sifting, are reduced to 43.

DAVID, JACQUES LOUIS (1748-1825), French painter, was born in Paris on April 30, 1748. His father was killed in a duel, when the boy was but nine years old. His education was begun at the Collège des Quatre Nations, but he was soon placed by his guardian in the studio of François Boucher. Boucher recommended him to J. M. Vien, the pioneer of the classical reaction in painting. Under him David studied for some years, and, after several attempts to win the *prix de Rome*, at last succeeded in 1775, with his "Loves of Antiochus and Stratonice." He then accompanied Vien, who had just been appointed director of the French academy at Rome. The classical reaction was now in full tide, Winkelmann was writing, Raphael Mengs painting, and the treasures of the Vatican galleries helped to confirm David in a taste already moulded by so many kindred influences. This severely classical spirit inspired his first important painting, "*Data obolus Bestiarum*," exhibited at Paris in 1780. The picture exactly suited the temper of the times, and was an immense success. It was followed by "The Grief of Andromache" (1783), "The Oath of the Horatii" (Salon, 1785), "The Death of Socrates," "Love of Paris and Helen" (1788), "Brutus" (1789). In the first years of the revolutionary movement the fashion of imitating the ancients even in dress and manners went to the most extravagant length and it was at this time that David returned to Paris.

The success of his sketch for the picture of the "Oath of the Tennis Court," and his pronounced republicanism, secured David's election to the Convention in Sept. 1792, by the *Section du Museum*, and in the January following his election into the Convention his vote was given for the king's death. David's revolutionary ideas, which led to his election to the presidency of the Convention and to the committee of general security, inspired his pictures "Last Moments of Lepelletier de Saint-Fargeau" and "Marat Assassinated." He also arranged the programme of the principal republican festivals. When Napoleon rose to power David became his enthusiastic admirer. His picture of Napoleon on horseback pointing the way to Italy is now in Berlin. During this period he also painted the "Rape of the Sabines," and "Leonidas at Thermopylae." Appointed painter to the emperor, David produced the two notable pictures "The Coronation" (of Josephine), and the "Distribution of the Eagles."

On the return of the Bourbons the painter was exiled with other regicides, and retired to Brussels, where he again returned to classical subjects "Amor quæting Psyche," "Mars disarmed by Venus," etc. He rejected the offer, made through Baron Humboldt, of the office of minister of fine arts at Berlin, and remained at Brussels till his death on Dec. 29, 1825.

It is difficult for a generation which has witnessed another complete revolution of the standards of artistic taste to realize the secret of David's immense popularity in his own day. Yet he exercised a powerful influence on a great influence. His pictures are important in their composition and draughtsmanship, and his knowledge of the eighteenth-century character is evident, especially in his portraits of the family of Madame Recamier, of the Convention, and of the family of Angoulême.

See *Exposition des oeuvres de David son école et son temps* (1871) and *Le Peintre David et ses oeuvres et documents inédits*, by J. L. Jules David, the painter's grandson (1880), I. Rosenthal, *David* (1904).

DAVID, PIERRE JEAN (1789-1856), usually called David d'Angers, French sculptor, was born at Angers on March 12, 1789, and died in Paris on Jan. 4, 1856. The son of a carver, he went to Paris at 17 with 11 francs in his pocket to study under Roland. After a year and a half's struggle he received a small annuity from the municipality of Angers and in 1811 won the *prix de Rome*, and was sent to Italy, where he worked for some time in Canova's studio. Returning to Paris in 1816, after a short visit to London, he received many important commissions. He was in revolt against the prevailing classical style, and one of his first works in Paris, the "Conde" at Versailles, shows the new tendency towards a more realistic method. In 1827 he visited England, and in 1828 and 1834, Germany. Always a Radical in politics, he had to leave France for a short period after the *Coup d'état* of Dec. 1831. Many of the most famous men and women of his time sat to David for busts or medallions. A nearly complete collection, originals or copies, is to be seen in the Musée David at Angers. Among David's most important works are the sculptures on the pediment of the Pantheon, showing the principal personages in France since the Revolution grouped round a figure of "La Patrie"; the Gutenberg monument at Strasbourg, the monument to General Gobert in Père Lachaise, the "Philopomen" in the Louvre, and the bust of Goethe, presented by him to the poet in 1831, in the public library at Weimar.

See H. Jouin, *David d'Angers et ses relations littéraires* (1890), *Lettres de P. J. David d'Angers à Louis Dupré* (1891), *Collection de portraits des contemporains d'après les médaillons de P. J. David* (1838).

DAVIDISTS, a fancy name rather than a recognized designation for three religious sects. It has been applied (1) to the followers (if he had any) of David of Dinant, in Belgium, the teacher or pupil of Amalric (Amaury) of Bena, both of whom taught apparently a species of pantheism. David's *Quaterni*, or *Quaterni*, condemned and burnt at Paris (1509), is a lost book, known only by references in Albertus Magnus and Thomas Aquinas, its author would have been burnt had he not fled. (2) To the followers of David George or Joris (q.v.). (3) To the followers of Francis David (1510-79), the apostle of Transylvanian unitarianism (see SOCIUS, UNITARIANISM).

DAVIDOVIC, LJUBOMIR (1863-1940), Yugoslav politician, was born at Vlasica in Serbia. In 1901 he entered parliament and, the next year, with Ljubomir Stojanović, founded the Independent Radical party. In 1904 he became Minister of Education, in 1905 President of the Skupština and in 1909 mayor of Belgrade. In that year he was one of the Serbian witnesses at the Friedjung trial in Vienna, and soon afterwards Prof. Masaryk laid before the Austrian delegation the papers on which the forgers had practised Davidovic's signature. In the Serbian Coalition cabinet, formed during the Austrian invasion in Nov. 1914, Davidovic again became Minister of Education, but in 1917 he resigned office and remained in active opposition to Pašić throughout the remainder of the World War. In 1919 he was elected chief of the newly formed Democratic party and was Yugoslav premier from August of that year until Feb. 1920. In July 1924 he again became Prime Minister at the head of a coalition of Democrats, Slovene Clericals and Bosnian Moslems, supported by the Croat peasants. He was, however, replaced, in 1924, by a purely Radical Government under Pašić. Not active in the succeeding governments, Davidovic, however, led the democratic party against the Government party in the elections of 1935 and 1938.

DAVIDSON, ANDREW BRUCE (1831-1902), Scottish divine, was born in 1831 at Kirkhill, Aberdeenshire, where his father, Andrew Davidson, had a farm. During his four years at Aberdeen university his mother supplied him fortnightly with provisions from the farm and sometimes walked the whole 20 miles from Kirkhill, handing the coach fee to her son. He graduated in 1849. In 1852, after three years as a schoolmaster, he entered New College, Edinburgh, and was licensed to preach in 1856. For two years he preached occasionally and took vacancies. In 1858 he became assistant professor of Hebrew at New College. He taught during the winter, and in the long vacation continued his

preparation for his life work. One year he worked in Germany under Ewald, another year he went to Syria to study Arabic. In 1862 he published the first part of a commentary on Job. It was never finished and deals only with one third of the book but it is recognized as the first really scientific commentary on the Old Testament in the English language. In 1863 he was appointed by the general assembly professor of oriental languages at New college. He was junior colleague of John Duncan (Rabbi Duncan) till 1870 and then for 30 years sole professor. He was a member of the Old Testament revision committee. He died on Jan 26, 1902.

Besides the commentary on Job he published a book on the *Hebrew Accents*, the only Scottish performance of the kind since the days of Thomas Boston. His *Introductory Hebrew Grammar* has been widely adopted as a textbook in theological colleges. His *Hebrew Syntax* has the same admirable clearness, precision and teaching quality. *His Commentary on the Epistle to the Hebrews* is one of a series of handbooks to Bible classes. These were followed by commentaries on Job, Ezekiel, Nahum, Habakkuk, and Zephaniah in the Cambridge series, and a Bible class primer on *The Exile and Restoration*. His lectures on *Old Testament Prophecy* were published after his death by J. A. Paterson. *The Theology of the Old Testament* in the "International Theological Library" is a posthumous volume edited by Salmond. "Isaiah" in the *Temple Bible* was finished, but not revised, when he died, and he also had in hand the volume on Isaiah for the *International Critical Commentary*, to which must be added a mass of articles contributed to the *Imperial Bible Dictionary*, the *Encyclopaedia Britannica* and the chief religious reviews. Various articles in *Hastings' Bible Dictionary* were by Davidson, including the article "God". Two volumes of sermons, *The Call of God* (with biographical introduction) and *Waiting upon God*, were published after his death.

DAVIDSON, JOHN (1857-1909), British poet, playwright and novelist son of the Rev Alexander Davidson a minister of the Evangelical Union, was born at Barnhead Renfrewshire, Scot., on April 11, 1857. In 1876 he studied for a session at Edinburgh university, and then went as a master to various Scottish schools till 1890, varying his experiences in 1884 by being a clerk in a Glasgow thread firm. He had married in 1885 and meanwhile he had published his poetical and fantastic plays, *Bruce* (1886), *Smith, a Tragic Farce* (1888) and *Scaramouch in Nazos* (1889). Determining at all costs to follow his literary vocation, he went to London in 1890. *Fleet Street Eclogues* (1893) at once established Davidson's position among the younger generation of British poets. He produced other books in prose but his most important work is found in his *Ballads and Songs* (1894), *Second Series of Fleet Street Eclogues* (1895), *New Ballads* (1897), *The Last Ballad, etc.* (1898) all full of remarkably fresh and unconventional beauty. Meanwhile, in 1896, he produced an English verse adaptation in *For the Crown* (acted by Forbes Robertson and Mrs Patrick Campbell) of François Coppée's drama *Pour la couronne*, and he wrote several other literary plays. In later years he lived at Penzance, provided with a small civil list pension, but otherwise badly off, for his writings brought in very little money. On March 23, 1909, he disappeared, in circumstances pointing to suicide, and six months later his body was found in the sea.

DAVIDSON OF LAMBETH, RANDALL THOMAS DAVIDSON, 1ST BARON (1848-1930), English divine, archbishop of Canterbury, 1903-28, was with King Edward VII at his death in 1910 and crowned King George V in 1911. He was one of the four counsellors of state who acted as his majesty's commission when the king went to India in 1911, and again in 1925 when the king went to the Mediterranean after illness. During the whole of this period he took a leading part as spokesman of the national church in the house of lords. Lord Morley bore public witness to the effectiveness of his intervention in the critical debate on the Parliament act in 1914. He made important contributions in debates on temperance, divorce and various social and moral questions. His influence was also constantly and successfully exerted in matters affecting the welfare of native races, e.g., in Kenya, and he made notable appeals on behalf of Christian minorities in the east. In his educational policy he has steadily supported definite religious instruction in all schools, by teachers willing to give it.

Trusted by Englishmen of all classes for his wisdom and good-

ness, the archbishop commanded the confidence of Free Church men to a greater degree than any of his predecessors. He had a peculiarly anxious task during World War I. On more than one occasion he lifted up his voice against reprisals which had "as a deliberate object the killing and wounding of noncombatants." Twice he visited the troops in France. In 1916 he placed himself at the head of a national mission which aimed at the deepening of religious life at home. At an early date he gave public support to the proposals for a League of Nations, and it was recognized as specially fitting that he should preach the sermon at the opening of the third assembly in Geneva, 1922. In 1922 Davidson took the lead in issuing a vigorous protest, signed by the leaders of the Anglican, Roman Free Church and Jewish communions, against religious persecution in Russia. In 1923 he made a successful public appeal for the retention of the ecumenical patriarchate at Constantinople.

The archbishop also took a deep interest in the work of the church overseas. He presided over the sixth Lambeth conference in 1920 attended by 252 out of the 368 bishops of the Anglican communion, and throughout the deliberations adopted a strong forward looking attitude. After the issue of the appeal to all Christian people by that conference he took a prominent part in securing widespread consideration of the proposals for the reunion of Christendom which it contained. He actively forwarded conferences with the Free Church representatives in England, a series of important meetings being held at Lambeth palace. He further expounded the appeal to the general assemblies of the Church of Scotland, and the United Free Church of Scotland in 1921. In addition, the archbishop markedly developed friendly relations between the Anglican and Orthodox churches, and it was to him that the patriarch (Meletios IV) of Constantinople communicated his synod's acceptance of the validity of Anglican ordinations in 1922. He also took "cognizance" of the conversations between Anglican and Roman Catholic theologians held at Malines (1921-25) under the presidency of Cardinal Mercier, Pope Pius XI taking a similar "cognizance."

He was instrumental in securing the passage of the Church Assembly (Powers) act 1919, and from 1920 to 1928 presided over the church assembly with wisdom and courage. During this period a large number of measures were passed. The principal measure, dealing with Prayer Book revision, was rejected by the house of commons on Dec 15, 1927. This situation, however, afforded an opportunity for an extraordinary outburst of admiration for the archbishop personally in all sections of the community. In Feb 1928 he completed the 50th year of his primacy—a primacy longer than any since Archbishop Warham. He displayed a remarkable combination of sincere piety, common sense, loyalty to truth and sympathy with modern movements. He resigned Nov 1928, was succeeded by Cosmo Lang, and was created a baron. He died May 25, 1930. (G & A B)

DAVIDSON, SAMUEL (1807-1898), Irish biblical scholar, was born near Ballymena. He became in 1842 professor of biblical criticism, literature and oriental languages at the Lancashire independent college, Manchester, but was obliged to resign in 1857 on account of *The Text of the Old Testament*, and the *Interpretation of the Bible*, written for a new edition of Horne's *Introduction to the Sacred Scripture*. In 1862 he removed to London to become scripture examiner in London university, and he spent the rest of his life in literary work. He died on April 1, 1898. Davidson was a member of the Old Testament revision committee.

Among Davidson's principal works are *The Hebrew Text of the Old Testament Revised* (1855), *Introduction to the Old Testament* (1862), *On a Fresh Revision of the Old Testament* (1873), *The Doctrine of Last Things in the New Testament* (1883), besides translations of the New Testament from Tischendorf's text, Geseler's *Ecclesiastical History* (1846) and Furst's *Hebrew and Chaldean Lexicon*.

DAVIDSON, THOMAS (1817-1885), British palaeontologist, born in Edinburgh on May 17, 1817, was educated partly in the Edinburgh university and partly in France, Italy and Switzerland. His *Monograph of British Fossil Brachiopoda* was published by the Palaeontographical society (6 vol. with 200 plates, 1850-86). He also prepared an exhaustive memoir on "Recent

Brachiopoda," published by the Linnean Society. He was elected F.R.S. in 1857. He died at Brighton on Oct. 14, 1885.

See biography with portrait and list of papers in *Geol. Mag.* for 1871, p. 245.

DAVIES, ARTHUR B. (1862-1928), American painter, was born at Utica, N.Y., on Sept. 26, 1862. He was a pupil of Dwight Williams at Utica, afterwards studying in New York and Chicago. He became an adherent of the Romantic school of painting and made notable contributions in the fields of etching and colour lithography. Among his more important works are "Dream" and "The Girdle of Ares," in the Metropolitan Museum, New York City; "Maya, Mirror of Illusions," in the Art Institute, Chicago; "Spring in a Valley" and "Night Overture," in the Minneapolis Institute of Art; and "The Place of the Mother" and "Children of Yesterday," in the Brooklyn Museum. In 1923 his picture, "After-Thoughts of Earth," procured for him from the Carnegie Trust a medal of the first class and \$1,500. He died in Italy on Oct. 24, 1928.

DAVIES, SIR HENRY WALFORD (1869-1941), knighted 1923, English organist and composer, was born at Oswestry, Salop, on Sept. 6, 1869, and educated privately. In 1882 he became a chorister at St. George's chapel, Windsor, and in 1885 assistant organist to Sir Walter Parratt there. From 1890-94 he was pupil and scholar at the Royal College of Music, where, in 1895, he became a teacher of counterpoint. In 1898 he was appointed organist to the Temple church, a post which he held until 1923. From 1903-07 he was conductor of the London Bach choir in succession to Stanford, and from 1919-26 professor of music in the University College of Wales, at Aberystwyth. During the World War, with the rank of major, he worked for the organization of music among the troops, and in 1918 was made director of music to the R.A.F. In 1919 he was appointed director of music and chairman of the National Council of Music, University of Wales, in 1924, Gresham professor of music. He was organist of St. George's chapel, Windsor, 1927-32.

His compositions include two symphonies, and in the way of choral works, *Everyman*, a felicitous setting for chorus and orchestra of the old morality play, which enjoyed wide favour, "Ode on Time" (1908), *The Sayings of Jesus* (1911), "Dante Fantasy" (1914), and *Heaven's Gate*, in addition to a quantity of church music, chamber music, part songs, etc. Over and above his creative work, Walford Davies was for many years one of the most potent and stimulating forces (not least by means of his immensely popular radio talks) in musical education in England. He wrote *Music and Worship* (1935), with Harvey Grace, and *The Pursuit of Music* (1936), and edited several song books. In 1937 he was created K.C.V.O.

DAVIES, HUBERT HENRY (1869-1917), English playwright, was born in Cheshire on March 17, 1869. After some years of journalism in San Francisco, where he also produced a few vaudeville, he returned to England and made a success in London with *Cosm. Kate* and *Mrs. Gorrings's Necklace*. Among his other comedies were *The Mollusc* (1907) and *Doormats* (1912). He produced *The Outcast* (1914). His health broke down as the result of overwork in France as a hospital orderly during the World War, and he was found dead at Robin Hood's bay, Yorks, on Aug. 17, 1917.

DAVIES, SIR JOHN (1569-1626), English poet, was baptized on April 16, 1569, at Tisbury, Wiltshire. He was educated at Winchester College, and became a commoner of Queen's College, Oxford, in 1585. In 1588 he entered the Middle Temple, and was called to the bar in 1595. In his general onslaught on literature in 1599 the archbishop of Canterbury ordered to be burnt his volume, *All Owen's Elegies, 3 Books*, by C. M. P. Ingram, by J. D. (Middleburgh, 1598), which contained numerous works by Marlowe. The epigrams were probably earlier in date of composition than the charming fragment entitled *Orchestra* (1596), written in praise of dancing, and dedicated to the author's "very friend, Master Richard Martin," but in the next year the French quarrel, and Davies was expelled from the society for having struck Martin with a cudgel in the hall of the Middle Temple. He spent the year after his expulsion at Oxford in the composition

of his philosophical poem on the nature of the soul and its immortality—*Nosce teipsum* (1599). Its force, eloquence and ingenuity, the orderly and lucid arrangement of its matter, place it among the finest of English philosophical poems. In 1599 Davies published a volume of 20 acrostics on the words *Elizabetha Regina*, entitled *Hymns to Astraea*. He produced no more poetry except two dialogues contributed to Francis Davison's *Poetical Rhapsody* (1608). In 1601 Davies was restored to his position at the bar, after making his apologies to Martin, and in the same year he sat for Corfe Castle in parliament. James I. received the author of *Nosce teipsum* with great favour, and sent him (1603) to Ireland as solicitor general, he was knighted in the same year. In 1606 he was promoted to be attorney-general for Ireland, and created sergeant-at-arms. One of his chief aims was to establish the Protestant religion firmly in Ireland, and he took an active part in the "plantation" of Ulster. In 1612 he published his prose *Discoverie of the true causes why Ireland was never entirely subdued until the beginning of his Majesty's happy reign* (ed. H. Morley in his *Ireland under Elizabeth and James I.* [1890]). In the same year he entered the Irish parliament as member for Fermanagh, and was elected speaker after a scene of disorder in which the Catholic nominee, Sir John Everard, who had been installed, was forcibly ejected. In the capacity of speaker he delivered an excellent address reviewing previous Irish parliaments. He resigned his Irish offices in 1619, and sat in the English parliament of 1621 for Newcastle-under-Lyme. With Sir Robert Cotton he was one of the founders of the Society of Antiquaries. He was appointed lord chief justice in 1626, but died suddenly before he could enter on the office. He had married (1609) Eleanor Touchet, daughter of George, Baron Audley. She developed eccentricity verging on madness, and wrote several fanatical books on prophecy.

BIBLIOGRAPHY.—In 1615 Davies published at Dublin *Le Premier Discours des Cases et Matiers in Ley resolues et adjupees en les Courts del Roy en cest Realm* (reprinted 1628). He issued an edition of his poems in 1622. His prose publications were mainly posthumous. *The Questions concerning Impositions, Tonnage, Poundage* was printed in 1626, and four of the tracts relating to Ireland, with an account of Davies and his services to that country, were edited by G. Chalmers in 1786. His works were edited by Dr. A. B. Grosart (1869-76), with a full biography, for the Fuller Worthes Library, also by H. Morley for the "Carisbrooke Library" (vol. x 1889). *Nosce teipsum* is printed in *Arthur's English Garner* (vol. v 1882).

DAVIES, JOHN, of Hereford (1565?-1618), English poet, was born at Hereford, and settled in Oxford as a writing master. His principal work is the *Microcosmus* (1603), modelled largely on Joshua Sylvester's translation of the *Semanes* of Du Bartas.

Among other works are—*Morum in modum* (1602), *The Holy Rood* (1609), *Whites Pilgrimage* (c. 1610), *The Scourge of Folly* (c. 1612), *The Muses Sacrifice* (1612), and *Whites Bedlam* (1607). His *Scourge of Folly* contains verses addressed to many of his contemporaries, to Shakespeare among others. He also wrote *A Select Second Husband* for Sir Thomas Overbury's wife (1616), and *The Writing Schoolmaster* (earliest known edition, 1631). His works were collected by Dr. A. B. Grosart (1873) for the Chertsey Worthes Library.

DAVIES (DAVISUS), JOHN (1679-1732), English classical scholar and critic, was born in London. He was president of Queen's College, Cambridge, and was considered one of the best commentators on Cicero. He edited the *Tusculanae disputationes* (1709), *De natura deorum* (1718), *De divinatione* and *De fato* (1725), *Academica* (1725), *De legibus* (1727), *De finibus* (1728) and other works. Davies's editions, which were intended to supplement those of Graevius, show a great knowledge of history and philosophy, but are too free in emendation.

DAVIES, JOHN LEWELLYN (1826-1916), English divine and educationalist, was born at Chichester on Feb. 26, 1826. He was educated at Repton and Trinity College, Cambridge, where he was made a fellow in 1851. He was ordained in the same year, and held successively several London livings. He was given the crown living of Christ church, Marylebone in 1856, and in 1889 became vicar of Kirkby Lonsdale, Westmorland, where he remained until 1908. Davies was closely associated with John Frederick Denison Maurice in the foundation of the Working Men's College (1854), where he taught for many years. He was elected to the first London school board in succession to Huxley,

and from 1873-74 and 1878-86 was principal of Queen's College, Harley street, founded by Maurice in 1848 for the advancement of women's education. Davies was an advocate of the higher education of women, a cause in which his sister, Sarah Emily Davies (q.v.), was also prominent, and favoured the granting to women of university degrees and the Parliamentary franchise. He died at Hampstead on May 17, 1916. With Vaughan he produced the well known translation of Plato's *Republic*.

DAVIES, SIR LOUIS HENRY (1845-1924), Canadian politician and jurist, was born in Prince Edward Island in 1845, of Huguenot descent. In 1882 he entered the Canadian parliament as a Liberal, and from 1896 to 1901 was minister of marine and fisheries. In the latter year he became one of the judges of the supreme court of Canada. In 1877 he was counsel for Great Britain before the Anglo-American fisheries arbitration at Halifax, in 1897 he was a joint delegate to Washington with Sir Wilfred Laurier on the Bering sea seal question, and in 1898-99 a member of the Anglo-American joint high commission at Quebec. In 1918 he became chief justice and a member of the privy council. He died at Ottawa on May 1, 1924.

DAVIES, RICHARD (c. 1501-1581), Welsh bishop and scholar, was born in north Wales and educated at New Inn Hall, Oxford, becoming vicar of Burnham, Bucks, in 1550. He took refuge at Geneva during the reign of Mary. In Jan. 1560 he was consecrated bishop of St. Asaph, whence he was translated, early in 1561, to the bishopric of St. Davids. Davies was a member of the council of Wales, was very friendly with Matthew Parker, archbishop of Canterbury, and was consulted both by him and by Burghley, on Welsh concerns. He took part in translating the New Testament into Welsh, and assisted with the Welsh translation of the Book of Common Prayer. He helped to revise the "Bishops' Bible" of 1568, being responsible for Deuteronomy and 2 Samuel. He died on Nov. 7, 1581.

DAVIES, SARAH EMILY (1830-1921), British educationalist, sister of John Llewellyn Davies (q.v.), was born at Southampton on April 22, 1830. She was educated at home, and later identified herself with the movement for the higher education of women, being also one of a group of women who, about 1858, were discussing the question of women's suffrage at the Kensington Society. In 1861 she became secretary to the committee which was formed to procure the admission of women to university examinations. In 1867, Miss Davies, with the help of Mme. Bodichon (Barbara Leigh Smith) and others, organized a women's college at Hitchin, which was subsequently transferred to Cambridge as Girton college in 1873. From 1870 to 1873 she was a member of the London School Board, and withdrew to become mistress of Girton college, Cambridge, a post which she held for two years. In 1873 she was elected a life governor of University college, London, and in 1882 became honorary secretary of Girton college, retiring in 1904. She died in London on July 13, 1921. She published *The Higher Education of Women* (1886), and *Thoughts on Some Questions Relating to Women* (1860-1908) (1910).

See B. Stephen, *Emily Davies and Girton College* (1927).

DAVIES, WILLIAM HENRY (1871-1940), British poet, born at Newport, Monmouth, April 20, 1871. After serving as apprentice to a picture-frame maker he tramped through America, crossed the Atlantic many times on cattle boats, became a pedlar and street singer in England, and after eight years of this life published his first volume of poems, *The Soul's Destroyer*, from the Marshalsea prison. Next year appeared in prose *The Auto Biography of a Super Tramp* (1908) with a preface by G. Bernard Shaw, and also *Nature Poems and Others*. Collected editions of his poems appeared in 1916, 1924, 1928. His poetry includes *Forty New Poems* (1918), *The Hour of Magic*, and *Other Poems* (1922), *A Poet's Alphabet* (1925), *The Song of Love* (1926), *Poems* (1930-31, 1932), *The Loneliest Mountain* (1939). He published a novel, *A Weak Woman* (1911), and volumes of nature studies, including *A Poet's Pilgrimage* (1918), *Later Days* (1925), *The Adventures of Johnny Walker Tramp* (1926).

DAVILA, ENRICO CATERINO (1576-1631), Italian historian, was descended from a Spanish noble family. His im-

mediate ancestors had been constables of the kingdom of Cyprus for the Venetian republic since 1464. But in 1570 the island was taken by the Turks, and Antonio Davila, the father of the historian, had to leave it, despoiled of all he possessed. He travelled into Spain and France, and finally returned to Padua, and at Sacco on Oct. 30, 1576, his youngest son, Enrico Caterino was born. About 1583 Antonio took this son to France, where he became a page in the service of Catharine de' Medici, wife of King Henry II. In due time he entered the military service, and fought through the civil wars until the peace in 1598. He then returned to Padua, where, and subsequently at Parma, he led a studious life until, when war broke out, he entered the service of the republic of Venice. During the whole of this active life he never lost sight of his early design of writing the history of those civil wars in France in which he had borne a part. The success of the *Istoria della guerra civile di Francia* was immediate and enormous. Over 200 editions followed, of which perhaps the best is the one published in Paris in 1644. Davila was murdered, while on his way to take over Cremona for Venice in July 1631.

The *Istoria* was translated into French by G. Baudouin (1642), into Spanish by Varen de Soto (Madrid, 1651, and Antwerp, 1686), into English by W. Aylesbury (1647), and by Charles Cotterel (1666), and into Latin by Pietro Francesco Cornazzano (1745). The best account of the life of Davila is that by Apostolo Zeno, prefixed to an edition of the history printed at Venice in 2 vols. in 1723.

DAVIS, CHARLES HAROLD (1857-1933), American landscape painter, was born at East Cambridge (Mass.), Feb. 2, 1857. A pupil of the schools of the Boston Museum of Fine Arts, he was sent to Paris in 1880. Having studied at the Academy Julian under Lefebvre and Boulenger, he went to Barbizon and painted much in the forest of Fontainebleau under the traditions of the "men of thirty." He became a full member of the National Academy of Design in 1906 and received many awards, including a silver medal at the Paris Exhibition of 1889. He is represented by important works in the Metropolitan Museum of Art, New York, the Corcoran Art Gallery, Washington, the Pennsylvania Academy, Philadelphia, and the Boston Museum of Fine Arts. The Union League club in New York had an exhibition of his works in Feb. 1927.

DAVIS, CUSHMAN KELLOGG (1838-1900), American political leader and lawyer, was born in Henderson, N.Y., on June 16, 1838. He was taken by his parents to Wisconsin Territory in the year of his birth, and was educated at Carroll college, Waukesha, Wis., and at the University of Michigan, where he graduated in 1857. After studying law he was admitted to the bar in 1860. During the Civil War he served as a first lieutenant in 1862-63 and in 1864 was an aide to Gen. Willis A. Gorman (1814-76). Resigning his commission in 1864, he settled in St. Paul, Minn., where he soon became prominent both at the bar and as a Republican, in politics. He served in the State house of representatives in 1867, and was U.S. district attorney for Minnesota (1868-73). In 1874-76 he was governor of the State, and from 1887 until his death at St. Paul, Nov. 27, 1900, was a member of the U.S. Senate, where he was one of the acknowledged leaders of his party, an able and frequent speaker, and a committee worker of great industry. He was one of the peace commissioners who negotiated and signed the treaty of Paris by which the Spanish American War was terminated. In addition to various speeches and public addresses, he published an essay entitled *The Law of Shakespeare* (1899).

See sketch by W. B. Chamberlain in *Michigan Alumnus*, vol. vii, pp. 133-139 (1901).

DAVIS, HENRY WILLIAM CARLESS, C.B.E. (1874-1928), British historian, a son of H. F. A. Davis of Stroud, Gloucestershire, was born on Jan. 13, 1874, and educated at Weymouth college and Balliol college, Oxford. He was a fellow of All Souls (1895-1902), and of Balliol (1902-21). During the World War he served in the War Trade Intelligence Department, and after attending the Peace Conference, directed the Overseas Trade Department. In 1921 Davis was appointed professor of modern history at Manchester and in 1925 he returned to Oxford as regius professor of modern history. He became, in addition, curator of the Bodleian Library in 1926. He was made

director of the *Dictionary of National Biography*, when in 1902, the copyright of that work passed to the Clarendon Press. Davis's historical work was chiefly done in the medieval field and found expression in his *England under the Normans and Angevins* (1905), *Medieval Europe* (1911), a revised edition of the *Select Charters of William Stubbs* (1913) and *Medieval England* (1924). The calendar of Anglo-Norman Royal Charters 1066-1554 was not completed, owing to the difficulty of obtaining literary assistance during the World War. Davis was able to finish only the first volume (1913).

The considered judgment, exact scholarship and constructive imagination shown in his *England under the Normans and Angevins* brought him into prominence as an authority on medieval history. This work was remarkable for its appreciation of the true position held by England in the period dealt with, and marks a definite advance in historical scholarship. His *Medieval Europe*, though showing a masterly knowledge of the period, was written rather for the general public than for the serious student. After the outbreak of war, Davis's writings on subjects connected with modern political thought (*The Political Thought of Treitschke* [1914], and various articles) demonstrated his skill in the delineation of character and the exposition of policy, and he brought to this work in a very different field the same characteristic ability and thoroughness which had made his medieval studies famous. He was exceptionally gifted as a tutor, particularly for those who, themselves, intended to become teachers. Davis died of pneumonia on June 28, 1928, in Edinburgh, where he had gone to conduct an examination.

He contributed several articles to this *Encyclopedia*.
DAVIS, HENRY WINTER (1817-1865), American politician, was born at Annapolis (Md.), U.S.A., on Aug. 16, 1817. He graduated from the law department of the University of Virginia in 1841, and began to practice law in Alexandria (Va.), but in 1850 removed to Baltimore (Md.). Early imbued with strong anti-slavery views, he began political life as a Whig, but when the Whig party disintegrated, became an "American" or "Know Nothing," and as such served in the national House of Representatives from 1835 to 1861. In 1860, not ready to ally himself wholly with the Republican party, he declined to be a candidate for the Republican nomination for the vice presidency. After Lincoln's election, he became a Republican, and was re-elected in 1862 to the National House of Representatives, in which his radical views commanded especial attention owing to his being one of the few representatives from a slave state. From Dec. 1862, to March 1865 he was chairman of the committee on foreign affairs. With other radical Republicans Davis was a bitter opponent of Lincoln's reconstruction plan of the Southern States. On Feb. 15, 1864, he reported a bill placing reconstruction under the control of Congress. The bill finally passed both houses but failed to receive the approval of the president, who on July 8 issued a proclamation defining his position. On Aug. 5, 1864, Davis joined Benjamin F. Wade of Ohio, in issuing the so-called "Wade Davis Manifesto," which violently denounced President Lincoln for encroaching on the domain of Congress. He was one of the radical leaders who preferred Fremont to Lincoln in 1864, but subsequently supported the President. In July 1865, he publicly advocated the extension of the suffrage to negroes. He died in Baltimore (Md.), on Dec. 30, 1865.

See *The Speeches of Henry Winter Davis* (1867), to which is prefixed an oration on his life and character delivered in the House of Representatives by Senator J. A. J. Creswell of Maryland.

DAVIS, JEFFERSON (1808-1889), American statesman, president of the Confederate States of America, was born on June 3, 1808 on a farm on the present site of Fairview Todd county, Ky. He was the tenth and youngest child of Samuel Davis (1755-1824), a descendant of a Welsh family that had settled originally in New Jersey, and he probably was a cousin of Samuel Davis (1724-1761), president of Princeton. Samuel Davis was born in Georgia, was a captain of infantry in the American revolution and subsequently was a planter. He married Jane Cook (1759-1844) of Scotch Irish stock. They moved to southwestern Kentucky in 1796, thence to Louisiana about 1810

and still again to Wilkinson county, Miss.

Schooled in Kentucky and in Mississippi, Davis attended Transylvania college Ky., in 1821-24, entered the U.S. Military Academy in Sept. 1824 and graduated no. 23 in a class of 33, in July 1828. Albert Sidney Johnston was in a higher class during Davis' cadetship, and Robert C. Lee and Joseph E. Johnston belonged to the next junior class. Davis remained in the army seven years, and served chiefly in Wisconsin, where a severe attack of pneumonia left him with a facial neuralgia that often incapacitated and sometimes blinded him. After 1831 he was never a man of robust health or of a normal nervous system.

Finding in 1835 that army life had become a routine, Davis resigned his commission as lieutenant and after marrying Sarah Knox Taylor, daughter of Col. Zachary Taylor, started as a cotton planter in Mississippi. His young bride died within three months of their marriage, and he spent the next ten years of his life on his plantation with his leisure devoted to hard reading. He soon developed a system that was almost a model in the relations of master and slaves. He gave the servant community a large measure of self-government and left in its hands, through an interesting jury system, the trial of all petty offenders. His own experience shaped his views, knowing that his negroes were well fed, happy and advancing, he could not believe the evil alleged against slavery.

An unsuccessful candidate of the legislature in 1843 and a Democratic presidential elector in 1844, Davis was elected to the U.S. House of Representatives in 1845. He was married that same year to Virginia Howell (1828-1907), granddaughter of Gov. Richard Howell of New Jersey. His service in Washington had hardly begun when the war with Mexico broke out and he was named colonel of the First Mississippi Infantry. He resigned from Congress in June 1846, and speedily had his troops well drilled and ready to join in the advance of the army under Gen. Zachary Taylor. Davis and his regiment acquitted themselves well in the battle of Monterey Sept. 21-23, 1846, and when Taylor's reduced force was attacked at Buena Vista on Feb. 22, 1847, a stand by the Mississippians saved the day for the American forces and made Davis something of a national figure. He was wounded in this battle and was forced to return to Mississippi, in the company of his troops, whose term of enlistment had expired. He declined President Polk's complimentary commission as brigadier-general of volunteers, on the ground that officers of volunteers should be named by the States, but in Aug. 1847 he accepted appointment to the United States Senate and soon was named chairman of its committee on military affairs. In 1851 the Democrats of Mississippi prevailed upon him, in the party's interest, to become a candidate for governor. He was defeated by a narrow vote, and was again in retirement for 18 months, but upon the inauguration of Franklin Pierce in 1853, he became secretary of war and served for four years. During this time he strengthened the coast defences, enlarged the army, directed valuable surveys for a railroad to the Pacific, introduced various betterments at West Point, and experimented with the use of camels as draft animals in the West. Expansionist plots in Cuba and in Nicaragua were supposed to have his support. President Pierce's endorsement of the repeal of the Missouri compromise was probably the result of Davis' influence with him.

Davis re-entered the United States Senate on March 4, 1857, but an affection of the eyes limited his activities for nearly two years. In 1859-60 he was one of the foremost leaders of Southern Democrats in opposition to Stephen A. Douglas. During his first term in the senate (1847-51) he had argued that all the territories should be opened to slavery, but he had been willing to accept an extension of the line of the Missouri compromise to the Pacific. After the verdict of the Supreme Court in the Dred Scott case he became more aggressive in his views of Southern rights and repudiated Stephen A. Douglas' doctrine of squatter sovereignty. He asserted that Congress had no right to deny admission to the Union to any territory because of the existence or non-existence of slavery, which he now frankly defended. His opinions were fully set forth in a series of resolutions offered on Feb. 2, 1860, and subsequently adopted. He did his utmost to

prevent the nomination of Douglas for the presidency, and after the split in the Democratic convention at Charleston, he supported Breckinridge and Lane, though he did not canvass for them.

Always a believer in the right of secession, Davis had favoured a convention of the Southern States in 1851, to consider what action they should take on the compromise of 1850, but until after the election of Lincoln in Nov. 1860 he never felt that circumstances justified a withdrawal from the Union. The victory of the party opposed to slavery, the uncompromising attitude of the Republican senators, and the unwillingness of President Buchanan to concede the right of a State peaceably to leave the Union, combined in the early winter of 1860-61 to convince Davis that the South in self protection should exercise its right of secession and should form a separate confederation. He united with six other senators from the cotton States in an historic declaration to this effect. At the instance of his colleagues he consented to serve on the "committee of thirteen" that sought a last minute settlement of slavery, but when he found that the Republican members would accept no compromise, he voted against the committee's report. Although he believed further efforts at accommodation were futile, he intervened in South Carolina's behalf in an attempt to have the Federal garrison withdrawn from Charleston harbour. Then, following the secession of his own State, he bade farewell to the senate on Jan. 21, 1861, in a moving address.

CIVIL WAR CAREER

Designated commander of his own State's troops, Davis hoped for a military career in case of war. Instead to his surprise and regret, he was unanimously chosen by Congress provisional president of the Confederate States Feb. 9, 1861. He was inaugurated at Montgomery, Ala., on Feb. 18, 1861, was formally elected by the people on Oct. 16, 1861, was again inaugurated, this time at Richmond, Va., under the "permanent constitution" on Feb. 22, 1862, and was holding the office of president when the Confederacy collapsed.

Selecting a cabinet of moderate views and of no more than moderate ability, Davis sought to negotiate for a withdrawal of the Union troops from military posts in the South, and he did not order military operations to be opened at Charleston, S.C., in April 1861, until he was convinced that the Lincoln administration had sent an armed expedition to retake and reinforce the garrison of Ft. Sumter.

The easy victory of the Confederates at Bull Run, on July 21, 1861, misled the South into believing that its independence would be won without great effort. Even Davis himself, who had warned the Confederacy of the magnitude of its task, seems to have been so deluded in the summer of 1861 by the hope of speedy foreign intervention that he did not capitalize the war ardour of the first months of the struggle. Events of the winter of 1861-62, however, spurred him to a vigorous policy. He procured the passage of a conscription law, and although the South had only one rolling-mill of any consequence, he contrived to manufacture cannon in sufficient numbers. Side arms, powder, uniforms and quartermasters stores were obtained in a country that had few facilities for making them. A navy was constructed in improvised yards and by secret, adroit purchase abroad. The war was financed on fiat money. The feeble, disjointed transport system of the South was welded together and was made to serve.

The results of hard effort, coupled with the fortunate choice of good commanders, showed during 1862 in a series of brilliant victories in Virginia. It was otherwise on the Mississippi. Friction among rival generals and a lack of co-ordination led from disappointment to disaster. A visit of Davis to the threatened front in Dec. 1862 failed to change the situation. The next year he decided on an offensive in the East in preference to reinforcement of the army on the Mississippi. It was his most momentous decision and perhaps his greatest blunder, because the Eastern offensive failed at Gettysburg and the very next day, by the fall of Vicksburg, the Confederacy was cut in half.

In 1864, Lee maintained a successful defensive in Virginia,

but in Tennessee and Georgia conditions went from bad to worse. Davis had delayed too long in removing the unsuccessful Braxton Bragg and after he at last relieved Bragg of command of the Army of Tennessee, he offended public opinion by making him his chief military adviser. On July 17, 1864, when Sherman was close to Atlanta, Davis supplanted Joseph E. Johnston by John B. Hood. This most ruinous change led to the speedy break-up of the only army that stood in the way of Sherman's march to join Grant, who by this time had pinned Lee to the Richmond defences. The reaction against Davis, who was blamed for all this, was immediate and severe. Congress no longer sustained him, the governors of North Carolina and of Georgia were openly antagonistic, the press denounced him, and Robert E. Lee would probably have been named dictator in Davis' place if Lee had been willing to countenance a revolution within the Confederacy. The failure of the Hampton Roads conference, on Feb. 3, 1865, to find any basis of peace, filled out the measure of Davis' unpopularity.

Davis was perhaps too harshly judged by his contemporaries. He never had a general military policy. He was too prone to take the course of immediate safety. After the removal of the Confederate capital to Richmond, in May 1861, he laid too much emphasis on the defence of Virginia to the neglect of other parts of the Confederacy. He acted on occasion as his own chief of staff, and then, with no apparent reason for change, he left his field commanders entirely to their own discretion. He became so absorbed in operations that he neglected the commissary and transport. Above all, he was not a good judge of men when his affection, his pride or his prejudice were involved, though it must be remembered to his credit that he kept his faith in Robert E. Lee at a time when the press and the country decreed Lee a failure because of his unsuccessful campaign in Western Virginia. Criticism sometimes aroused in Davis a dangerous obstinacy. He could not brook open opposition and he was singularly sensitive. This last named bad quality, his coldness and his personal dignity kept him from making an effective appeal to the emotions of his people. He was unhappy in his dealings with a short-sighted, contentious congress, and he was maladroit in his foreign relations, particularly with France. His loyalty to his friends was so extreme as to be a positive vice. But against all his failings it is to be set the fact that the agricultural South, with resources vastly inferior to those of the North, kept up the struggle for four years. Perhaps the strongest single force in that defence, when all is said, was Jefferson Davis.

On the evacuation of Richmond, April 2-3, 1865, Davis removed the executive offices to Danville, Va., and thence to Greensboro, N.C. Journeying southward in the hope of reaching the Trans-Mississippi department, he was captured near Irwinville, Ga., on May 10, 1865, and was transported to Ft. Monroe, Va. He was confined there, under threat of a trial for treason, until May 4, 1867, when he was admitted to bail and was allowed to go to Canada. During the early part of his imprisonment he was manacled and subjected to severities that impaired his health. This maltreatment, and the effort of the North to make him a scapegoat, won for him the sympathy of the South and restored him to his former place in its affection. Although he was twice indicted for treason, the proceedings were dropped after the general amnesty proclamation of Dec. 25, 1868. He subsequently visited Europe, served for a time as president of an insurance company and then retired to Beauvoir, the home of an admiring friend in Mississippi, where he wrote his *Rise and Fall of the Confederate Government* in two volumes (1881). This is an excellent review of the constitutional questions underlying secession but is in many respects a singularly reticent account of his administration. He later composed *A Short History of the Confederate States of America*, issued posthumously in 1890. He declined to take any part in politics on his return to the United States, and he was cheerfully engaged in his correspondence and in interviews with frequent visitors when a brief illness from a bronchial complaint terminated fatally on Dec. 6, 1889, in New Orleans, La. He was buried there, but in 1893 his body was taken to Richmond and on May 31 was reinterred in Hollywood cemetery.

In person, Jefferson Davis was imposing, over 6 ft. in height, erect, thin and graceful in his movements. His jaw was strong, his eyes were grey blue, his nose was slightly aquiline and his features were sharply cut. He had much dignity of manner and a fine voice, combined with unflinching personal courtesy.

All four of Davis' sons predeceased him. Besides his widow by his second marriage, he left two daughters, Margaret Davis (1857-1909), who married J. Addison Hayes, and Virginia ("Winne") Davis (1864-1898), known as the "daughter of the Confederacy," born in the confederate executive mansion. She wrote several books that enjoyed some popularity. Mrs. Jefferson Davis lived until 1907, chiefly in New York. Her biography of her husband in two volumes, *Jefferson Davis: A Memoir* (1890) is a detailed and persuasive picture of Davis.

BIBLIOGRAPHY.—F. H. Alfriend and E. A. Pollard soon after the war wrote partisan lives that are now supplanted by Mrs. Davis' *Memoir* (see above), by W. E. Dodd's *Jefferson Davis* (1907) by A. C. Gordon's biography of the same title (1918) and by H. J. Eckenrode's *Jefferson Davis, President of the South* (1923), an exacting critique of Davis' military policy. Dunbar Rowland in 1923 issued in ten volumes *Jefferson Davis, Constitutionally, His Letters, Papers and Speeches*. Mrs. Dunbar Rowland (Eron Rowland) published (1928) a biography *Varina Howell, Wife of Jefferson Davis*. W. H. Whitsett published a tentative *Genealogy* in 1910. See also Allen Tate, *Jefferson Davis: His Rise and Fall* (1929). (D S F)

DAVIS or DAVYS, JOHN (1550?-1605), one of the chief English navigators and explorers under Elizabeth, was born at Sandridge near Dartmouth about 1550. He early made several voyages with Adrian Gilbert. In Jan. 1583 he appears to have broached his design of a north west passage to Walsingham and John Dee, and in 1585 he started on his first north western expedition. He began by striking the ice bound east shore of Greenland, which he followed south to Cape Farewell, thence he turned north, and coasted the west Greenland littoral, and shaped a "course for China" by the north west. In 66° N., however, he fell in with Baffin Land, and though he pushed some way up Cumberland sound, he turned back (end of August). He tried again in 1586 and 1587, in the last voyage he pushed through the straits still named after him into Baffin's bay, coasting west Greenland to 73° N., almost to Upernivik. Many points in Arctic latitudes (Cumberland sound, Cape Walsingham, Evertson sound, etc.) retain names given them by Davis, who ranks with Baffin and Hudson as the greatest of early Arctic explorers and, like Frobenius, narrowly missed the discovery of Hudson's bay via Hudson's straits.

In 1588 he seems to have commanded the "Black Dog" against the Spanish Armada, and in 1591 he accompanied Thomas Cavendish on his last voyage, with the object of searching "that north-west discovery upon the back parts of America." After the rest of Cavendish's expedition returned unsuccessful, he continued to attempt on his own account the passage of the Strait of Mazellan and discovered the Falkland Islands. After his return in 1593 he published a valuable treatise on practical navigation in *The Seaman's Secrets* (1594) and a more theoretical work in *The World's Hydrographical Description* (1595). His invention of brack-water and double quadrant (called "Davis's Quadrant") held the field long after Hadley's reflecting quadrant had been introduced. In 1596-97 Davis sailed with Sir Raleigh (as master) at Sir W. Raleigh's request to Cadiz and the Azores, and in 1598-1600 he accompanied a Dutch expedition to the East Indies as pilot. In 1600-03 he accompanied Sir James Lancaster as first pilot on his voyage in the service of the East India Company, and in Dec. 1603 he sailed again for the same destination as pilot to Sir Edw. Mitchellborne (or Michelson). On this journey he was killed by Japanese pirates off Bantang near Sumatra.

A *Traverse Book made by John Davis* in 1587, an *Account of his Second Voyage in 1586 and a Report of Master John Davis of his three voyages made for the Discovery of the North West Passage* were printed in Hakluyt's collection. Davis himself published *The Seaman's Secrets*, divided into *Two Parts* (1591), *The World's Hydrographical Description* (1595) whereby appear there a short and speedy Passage into the South Sea, to China, Malacca, the Philippines, and India, by Northern Navigation (1595). Numerous references to Davis are in the *Calendar of State Papers Domestic* (1591-91), and *Le Indes* (1573-1616). See also *Travels and Works of John Davis*, ed. A. H. Markham (Hakluyt Society, 1880), and the article "John Davis" by Sir J. Laughton in the *Diet. Nat. Biog.* (C R B)

DAVIS, JOHN WILLIAM (1873-), American lawyer, was born at Clarksburg (W. Va.), April 13, 1873, where he received his early education. He graduated at Washington and Lee University in 1892, and from the law school there in 1895, being admitted to the bar in the same year. After a year as assistant professor of law at his alma mater, he returned in 1897 to Clarksburg, where he entered into an informal partnership with his father, also a lawyer, which continued until 1913. In 1890 he was elected a member of the West Virginia house of delegates, and in 1904 was a delegate to the Democratic national convention at St. Louis. He was elected to the 62nd (1911) and 63rd (1913) congresses for the first West Virginia district. During his period of service he was one of the managers on the part of the House in the successful impeachment of Judge Archbald.

In Aug. 1913, he was appointed solicitor general of the United States, an office which he held until 1918. In this position he conducted many important cases, among them the Midwest Oil case, involving the right of the President to withdraw from entry public lands thought to contain mineral deposits. From 1913 to 1918 he was counsel for the American Red Cross. In 1918 he was appointed American delegate to a conference with Germany at Bern on the treatment and exchange of prisoners of war, and in the same year succeeded Walter Hines Page as American ambassador to Great Britain, retaining this post until 1921. Among the honours conferred upon him was that of election as a bencher of the Middle Temple.

During the Peace Conference John W. Davis was one of President Wilson's advisers, and was the American representative on the joint committee which drafted the form of Allied control and government in the occupied Rhineland territory. In 1921 he returned from England and accepted a partnership in the New York law firm of Stetson, Jennings and Russell, which had many distinguished clients, among them J. P. Morgan and Co., and the Guaranty Trust Company. Davis was nominated on the 103rd ballot as Democratic candidate for the presidency at the Democratic national convention held in New York city, July 1924. The ensuing election resulted in an overwhelming victory for Calvin Coolidge, the Republican candidate, the electoral vote being 382 for the latter, 136 for Davis and 13 for La Follette, the Progressive candidate, while the popular vote was 15,748,356 for Coolidge, 8,617,454 for Davis and 4,686,681 for La Follette.

DAVIS, RICHARD HARDING (1864-1916), American writer, was born in Philadelphia, April 18, 1864. He studied at Lehigh and Johns Hopkins universities, and in 1886 became a reporter on the Philadelphia *Record*. After working on several newspapers, at the same time writing short stories, he was managing editor of *Harper's Weekly*. In Dec. 1890 he arranged to travel and write for *Harper's Monthly*, the first book thus resulting being *The West from a Car Window* (1892). He became widely known as a war correspondent, reporting every war from the Greco-Turkish War (1897) to the World War. Of his numerous works of fiction, the earliest are the best, especially *Gallegher and Other Stories* (1891), and *Van Bibber and Others* (1892). His other books include *Soldiers of Fortune* (1897), *A Year from a Reporter's Note-Book* (1898), *Real Soldiers of Fortune* (1906), *Forces* (1906), *The White Mice* (1909), *Notes of a War Correspondent* (1910), and *Somewhere in France* (1915). He died near Mt. Kisco, N.Y., April 11, 1916.

There have been several collective editions, the principal one being *The Novels and Stories of Richard Harding Davis* (1916). A collection of the best of his short stories, from *Gallegher to the Desert*, was edited by Roger Burroughs in 1907. See also *Adventures and Letters of Richard Harding Davis* (1917), edited by his brother Charles B. Davis, and *Richard Harding Davis, a Bibliography* (1924), by H. C. Quincy.

DAVIS, THOMAS OSBORNE (1814-1845), Irish poet and politician, was born at Mallow, co. Cork. He graduated at Trinity College, Dublin in 1836 and was called to the bar in 1838. Adopting nationalist views he joined John Blake Dillon in editing the *Dublin Morning Register* (1841), and worked, as a follower of Daniel O'Connell, on the committee of the repeal association. He helped Dillon and Charles Gavan Duffy to found the weekly newspaper, *The Nation*, in 1842 to which he contributed a series

of lyrics, "The Lament of Owen Roe O'Neill," "The Battle of Pontenoy," "The Geraldines," "Maure Bhan a Stoir," and many others. Differences arose between O'Connell and the young writers of *The Nation*, and Davis was one of the leaders of the extremist party, "Young Ireland," till his premature death.

See his *Poems and his Literary and Historical Essays* collected in 1846 (new ed. 1915). There is an edition of his prose writings (1880) in the *Camelot Classics*. See the monograph on *Thomas Davis* by Sir Charles Gavan Duffy (1890, abridged ed. 1896) and the same writer's *Young Ireland* (revised ed. 1896).

DAVIS, WILLIAM MORRIS (1850-1934), American geographer and geologist, was born in Philadelphia, Pa., on Feb. 12, 1850. After graduating from the Lawrence scientific school, Harvard university in 1870, he was assistant astronomer at the Argentine National observatory, Cordoba, Argentina, in 1870-71. In 1877 he made a tour of the world. He was instructor and professor of physical geography and geology at Harvard from 1877 until 1912 when he was made professor emeritus. In 1903 he went to Turkistan as a physiographer of Pumpelly's Carnegie institution expedition. He visited South Africa in 1905 and Australia in 1914 as guest of the British Association for the Advancement of Science. He was visiting professor at the University of Berlin in 1908-09, and at the University of Paris in 1911-12. In 1914 he crossed the Pacific on a Shaler memorial study of coral reefs. He was founder and for three terms president of the Association of American Geographers, founder and president (1902-11) of the Harvard Travellers' club, and president (1911) of the Geological Society of America. By his lectures and writings on the development of the physical features of the earth he won high rank among modern physiographers.

Among his published works are *Elementary Meteorology* (1894), *The Triassic Formation of Connecticut* (U.S. Geological Survey, 1896), *Physical Geography* (1898), *Practical Exercises in Physical Geography* (1908), *Geographical Essays* (1909), *Physiogeographie* (with G. Braun, 1911), *Erkl. Beschreibung der Landformen* (lectures in Berlin, 1912), *The Coral Reef Problem* (1928), and numerous scientific essays. In 1895 he was made a member of the editorial committee of *Science* and in 1909 he became associate editor of the *American Journal of Science*.

DAVISON, WILLIAM (c. 1541-1608), secretary to Queen Elizabeth, was of Scottish descent. In 1566 he acted as secretary to Henry Killigrew (d. 1603), when he was sent into Scotland by Elizabeth on a mission to Mary, queen of Scots. Remaining in that country for about 10 years, Davison then went twice to the Netherlands on diplomatic business, returning to England in 1586 to defend the hasty conduct of his friend, Robert Dudley, earl of Leicester, who had assumed the office of Governor of the Low Countries without Elizabeth's instructions. In the same year he became member of parliament for Knaresborough, a privy councillor, and assistant to Elizabeth's secretary, Thomas Walsingham, but he soon appears to have acted rather as the colleague than the subordinate of Walsingham. He was a member of the commission appointed to try Mary, queen of Scots, although he took no part in its proceedings, was never at Fotheringhay, and was not present at Westminster when the sentence of death was passed. The warrant for Mary's execution was entrusted to Davison. On this occasion, and also in subsequent interviews with her secretary, Elizabeth suggested that she would be glad to avoid the responsibility of the execution, but Mary's gaolers, Paulet and Drury, refused to take the hints thrown out to them. Meanwhile, the privy council having been summoned by Lord Burghley, it was decided to carry out the sentence at once, and Mary was beheaded on Feb. 8, 1587. When the news of the execution reached Elizabeth she was extremely indignant, and her wrath was chiefly directed against Davison, who, she asserted, had disobeyed her instructions not to part with the warrant. The secretary was arrested and thrown into prison, but, although he defended himself when interrogated in the Tower, he did not say anything about the queen's wish to get rid of Mary by assassination. Charged before the Star Chamber (March 28, 1587) with misprision and contempt, he was acquitted by many of the commissioners of evil intention, but was sentenced to pay a fine of 10,000 marks, and to imprisonment during the

queen's pleasure, but he was released in 1589. He retired to Stepney, where he died. He was buried on Dec. 4, 1608. Davison was undoubtedly made the scapegoat for the queen's pusillanimous conduct.

His eldest son FRANCIS DAVISON (c. 1575-c. 1619), and his fourth son WALTER (1581-1608?) both contributed poems to the *Poetical Rhapsody* (1602), notices of them are given in Sir N. H. Nicolas's edition (1826) of that miscellany. Francis Davison also wrote a metrical translation of the Psalms, which remained in ms. until they were edited by Sir E. Brydges and by Nicolas in the 19th century.

Many state papers written by him, and many of his letters, are extant in various collections of manuscripts. See Sir N. H. Nicolas, *Life of W. Davison* (1823), J. A. Froude, *History of England* (1881 fol.), *Calendar of State Papers 1580-1609*, and *Correspondence of Leicester during his Government of the Low Countries*, edited by J. Bruce (1814).

DAVIS STRAIT, the broad strait which separates Greenland from North America, and connects Baffin bay with the open Atlantic. At its narrowest point, which occurs just where the Arctic Circle crosses it, it is nearly 200 m. wide. This part is also the shallowest, a sounding of 122 fathoms being found in the centre, whereas the depth increases rapidly both to the north and to south. Along the western shore (Baffin Land) a cold current passes southward, but along the east there is a warm northward stream. There are a few Danish settlements on the Greenland coast. The strait takes its name from the explorer John Davis.

DAVITT, MICHAEL (1846-1906), Irish Nationalist politician, son of a peasant farmer, was born at Straide, Co. Mayo, on March 25, 1846. His father was evicted for non payment of rent in 1852, and migrated to Lancashire, where at the age of ten the boy began work in a cotton mill at Haslingden. In 1857 he lost his right arm by a machinery accident, he was sent to school, and at 15 became a newsboy and printer's "devil." He drifted into the ranks of the Fenian brotherhood in 1865, and on May 14, 1870, he was arrested at Paddington for treason felony in arranging to send firearms into Ireland, and was sentenced to 15 years penal servitude. After seven years, spent chiefly at Dartmoor, he was released on ticket-of-leave. He at once rejoined the "Irish Republican Brotherhood," and went to the United States, where his mother, herself of American birth, had settled with the rest of the family, with the idea of grafting constitutional methods on the revolutionary movement on lines which he had thought out in prison. He proposed to link up the campaign for independence with the agrarian question. Returning to Ireland he seems to have persuaded Parnell of the importance of the agrarian element, and helped him to start the Land League in 1879, and his violent speeches resulted in his re-arrest and consignment to Portland by Sir William Harcourt, then home secretary. He was released in 1882, but was again prosecuted for seditious speeches, and imprisoned for three months in 1883. Before this his support of Parnell had led to his expulsion from the supreme council of the I.R.B., though he remained a member of the organization until 1882. Between 1882 and 1885 he conducted a campaign on land nationalization, which Parnell repudiated. He had been elected to parliament for Meath as a Nationalist in 1882, but, being a convict, was disqualified to sit. He was included as one of the respondents before the Parnell Commission (1888-1889), and spoke for five days in his own defence. That he had brought the Irish Party into contact with the Fenians in America was undoubted. (See PARNELL.) He took the anti-Parnellite side in 1890, and in 1892 was elected to parliament for North Meath, but was unseated on petition. He was then returned for North East Cork, but had to vacate his seat through bankruptcy, caused by the costs in the North Meath petition. In 1895 he was elected for West Mayo. In 1898 he helped William O'Brien to found the United Irish League to reconcile the Parnellite and anti-Parnellite factions. He retired from the House of Commons to express his disapproval of the Boer War. He fiercely opposed the Wyndham Land Purchase Act and William O'Brien's conciliatory policy. He died on May 31, 1906, in Dublin. A sincere but embittered Nationalist, anti-English, anti-clerical and sceptical as to the value of the purely parliamentary agitation

for Home Rule, Davitt was often in conflict with his fellow Home Rulers. In later years his socialist radicalism connected him closely with the Labour Party. His force of character earned him the respect of many, even of those who thought his doctrine pernicious. The chief original authority is to be found in his own works, notably in his speech before the Parnell Commission, separately published as *The Defence of the Land League* (1891).

See also F. Sheehy Skeffington, *Michael Davitt*, etc. (1908).

DAVOS, a mountain valley in the Swiss canton of the Grisons (Romansch *Tavan*), lying east of Coire (40 m distant by rail), and north-west of the Lower Engadine (18 m by road from Sus). It contains two main villages, 2 m from each other, Dorfl and Platz (the chief hamlet), which are 5,015 ft above sea level, and had a population in 1950 of 10,433, a figure exceeded in the Grisons only by Coire. Of the population in 1920 5,885 were Protestants, 3,309 Romanists and 163 Jews, while 7,776 were German-speaking and 430 Romansch speaking. Tavaus or Tavauns is mentioned in 1160 and 1213, as a mountain pasture or "alp." It was then in the hands of a Romansch speaking population, as is shown by many surviving field names. But between 1260 and 1282, German-speaking colonists from the Upper Valais were planted there, so that it has long been a Teutonic island in the midst of a Romansch-speaking population. Historically it is associated with the Prattigau or Landquart valley to the north, and in 1436 became the capital of the League of the Ten Jurisdictions (See Grisons). It formerly contained many iron mines, and belonged from 1477 to 1649 to the Austrian Habsburgs.

In 1860 the population was only 1,705, the increase being due to the fact that the region is much frequented as a winter resort and has many sanatoria, etc. At the north end of the valley is lake Davos, while from Platz the *Landwasserstrasse* leads (20 m) down to the Alvanseubad station.

DAVOUT, LOUIS NICOLAS, duke of Auerstadt and prince of Eckmühl (1770-1833), marshal of France, was born at Annoux (Yonne) on May 10, 1770. His name is also, less correctly, spelt Davout and Davoust. He entered the French army as a sub-lieutenant in 1788, and was *chef de bataillon* in a volunteer corps in the campaign of 1792, and distinguished himself at Neerwinden in the following spring. He had just been promoted general of brigade when he was removed from the active list as being of noble birth. He served, however, in the campaigns of 1794-97 on the Rhine, and accompanied Desaix in the Egyptian expedition of Bonaparte. On his return he fought in the campaign of Marengo under Napoleon, who made him a general of division, and in 1801 gave him a command in the consular guard. Davout was created a marshal of France when Napoleon became emperor. As commander of the III corps of the *Grande Armée* Davout rendered the greatest services. At Austerlitz, after a forced march of 48 hours, the III corps bore the brunt of the allies' attack. In the Jena campaign Davout with a single corps fought and won the brilliant victory of Auerstadt against the main Prussian army (See *НОВОРУССКО-ПРУССКАЯ*). He took part in the campaign of Eylau and Friedland. Napoleon left him as governor-general in the grand duchy of Warsaw when the treaty of Tilsit put an end to the war (1807), and in 1808 created him duke of Auerstadt. In the war of 1809 Davout took a brilliant part in the actions which culminated in the victory of Eckmühl, and had an important share in the battle of Wagram (1809). He was created prince of Eckmühl about this time. It was Davout who was entrusted by Napoleon with the task of organizing the corps of observation of the Elbe, which was in reality the army with which the emperor invaded Russia in 1812. In this Davout commanded the I corps over 70,000 strong and defeated the Russians at Mohiuev before he joined the main army with which he continued throughout the campaign and the retreat from Moscow. In 1813 he defended Hamburg, a city ill-fortified and provisioned and full of disaffection through a long siege, only surrendering the place on the direct order of Louis XVIII after the fall of Napoleon in 1814.

Davout was a stern disciplinarian, almost the only one of the marshals who exacted rigid and precise obedience from his troops. Thus, in the earlier days of the *Grande Armée*, it was always the

III corps which was entrusted with the most difficult part of the work in hand. His rapacity in the conduct of civil affairs was in reality Napoleon's, for he gave the same undeviating obedience to superior orders which he enforced on his own subordinates. He was admitted by his contemporaries and by later judgment to be one of the ablest, perhaps the ablest, of all Napoleon's marshals. On the first restoration he retired into private life, and at once joined Napoleon on his return from Elba. Appointed minister of war, he was so far indispensable to the war department that Napoleon kept him at Paris during the Waterloo campaign. Napoleon has been criticised for not availing himself in the field of the services of the best general he then possessed. Davout directed the defence of Paris after Waterloo, and was deprived of his marshalate and his titles at the second restoration. When some of his subordinate generals were proscribed, he demanded to be held responsible for their acts, as executed under his orders, and he endeavoured to prevent the condemnation of Ney. After a time the hostility of the Bourbons towards Davout died away, and he was reconciled to the monarchy. In 1817 his rank and titles were restored, and in 1819 he became a member of the chamber of peers. He died in Paris June 1, 1833.

See Ch de Mazade, *Corr du mar Davout* (1885), the marquis de Blockville, *Le Maréchal Davout raconté par ses sens et lui-même* (Paris, 1870-80, 1887), Chemer, *Davout, duc d'Auerstadt* (Paris, 1866).

DAVY, SIR HUMPHRY, BART (1778-1829), English chemist, was born on Dec 17, 1778, at Penzance, Cornwall. His father was a wood carver. In his school days at the grammar schools of Penzance and Truro, the boy showed few signs of a taste for scientific pursuits. After the death of his father (1794) he was apprenticed to a surgeon-apothecary at Penzance where he studied metaphysics, ethics and mathematics. He turned to chemistry at the end of 1797, and, after reading Nicholson's and Lavoisier's treatises he began a series of chemical experiments with any apparatus and materials he could obtain. About this time he made the acquaintance of Davies Giddy, afterwards Gilbert (1767-1839), who was president of the Royal society (1827-31). Giddy recommended him to Dr Thomas Beddoes, who was in 1798 establishing his Medical Pneumatic institution at Bristol for investigating the medicinal properties of various gases. Here Davy, released from his indentures, was installed as superintendent toward the end of 1798. Early next year two papers by him were published by Beddoes, these contained the results of Davy's crude experiments and theories hastily formed on insufficient evidence.

One of his first discoveries at the Pneumatic institution on April 9, 1799, was that pure nitrous oxide is perfectly respirable, and he narrates that on the next day he became "absolutely intoxicated" through breathing 16 quarts of it for "near seven minutes." This discovery of the effect of *laughing gas* brought both him and the Pneumatic institution into prominence, and Count Rumford (*qv*) requiring a lecturer on chemistry for the recently established Royal institution in London, engaged him in 1801 as assistant lecturer in chemistry and director of the laboratory. He was almost at once appointed lecturer, and his promotion to be professor followed on May 31, 1802. One of his first tasks was the delivery of a course of lectures on the chemical principles of tanning. The main facts he discovered from his experiments in this connection were described before the Royal society in 1802-03. He showed that oak bark could be replaced by the much cheaper catechu. In 1802 the board of agriculture requested him to direct his attention to agricultural subjects, and in 1803, with the acquiescence of the Royal institution, he gave his first course of lectures on agricultural chemistry and continued them for ten successive years ultimately publishing their substance as *Elements of Agricultural Chemistry* in 1813. Although Davy had taken up the subject by order, this book remained for nearly 50 years the standard work on the subject.

But his chief interest at the Royal institution was with electro-chemistry. His early work on this subject is summed up in his first Bakerian lecture "On some Chemical Agencies of Electricity." One of the principal results was the proof that pure water does

not give acid and alkali when electrolyzed. He proposed an electrical theory of chemical compounds that gave an orderly presentation of a host of complex facts. It was based on the hypothesis that chemical and electrical attraction are produced by the same cause. This paper gained him from the French institute the medal offered by Napoleon for the best experiment made each year on "galvanism." Sodium and potassium hydroxide were considered to be elements. Their decomposition and the isolation of potassium and sodium by an electrolytic method was effected by Davy in Oct. 1807. This feat was of great importance and created a scientific furor. According to his cousin, Edmund Davy, then his laboratory assistant, he was so delighted with this achievement that he danced about the room in ecstasy.

Four days after reading his second Bakerian lecture (Nov. 1807) his health broke down, and he was unable to resume work until March 1808. He continued to research on the alkalis and earths and his results were communicated in successive Bakerian lectures (1808-10). Another important discovery due to Davy was that oxymuriatic acid was a simple substance, he proposed the name "chlorine" for it. He succeeded in preparing boron, for which at first he proposed the name boracium, under the impression that it was a metal. Davy also discovered hydrogen telluride, hydrogen phosphide and a number of other compounds. On April 9, 1812, he gave his farewell lecture as professor of chemistry at the Royal institution, though he continued his connection as an honorary professor. He was succeeded by William Thomas Brande, and then by Michael Faraday. In April 1812 he was knighted, and married to Mrs. Apreece, daughter and heiress of Charles Kerr of Kelso. A few months after his marriage he published the first and only volume of his *Elements of Chemical Philosophy*.

In Oct. 1813 he started with his wife for a continental tour, and with them, as "assistant in experiments and writing," went Michael Faraday, his assistant in the Royal institution laboratory. In spite of the fact that England and France were at war Davy was welcomed in Paris, where he was made a corresponding member of the First Class of the institute, i.e., the scientific section. While there he proved the newly discovered material iodine to be an element, similar to chlorine. From Paris he went to Genoa where he investigated the electricity of the torpedo fish, and at Florence, by the aid of the great burning glass in the Accademia del Cimento, he effected the combustion of the diamond in oxygen and decided that, beyond containing a little hydrogen, it consisted of pure carbon.

A few months after his return, through Germany, to London in 1815, at the request of the authorities, he considered the construction of a miner's safety lamp. His lamps were brought into use in the mines in 1816. A large collection of the different models made by Davy in the course of his inquiries is in the possession of the Royal institution. He took out no patent for his invention, and in recognition of his disinterestedness the Newcastle coal owners in Sept. 1817 presented him with a dinner service of silver plate. Davy's will directed that this service should pass to his brother, Dr. John Davy, on whose decease, if he had no heirs who could make use of it, it was to be melted and sold, the proceeds going to the Royal society "to found a medal to be given annually for the most important discovery in chemistry anywhere made in Europe or Anglo-America." The silver produced £736, and the interest on that sum is expended on the Davy medal, which was awarded for the first time, in 1877, to R. W. von Bunsen and Gustav Kirchhoff for their discovery of spectrum analysis.

In 1818 he received a baronetcy for this signal service to industry. In that year also he was commissioned by the British government to examine the papyrus of Heracleum in the Neapolitan museum. He had been secretary of the Royal society from 1807 to 1812, and on his return from Italy in 1820 became president, but his personal qualities did not make for success in that office, especially in comparison with the tact and firmness of his predecessor, Sir Joseph Banks. He resigned in 1826. He directed his attention to various subjects, chiefly electromagnetism, but his researches were less successful than his earlier experiments

In 1823 the admiralty consulted the Royal society as to a means of preserving the copper sheathing of ships from corrosion and keeping it smooth, and he suggested that the copper would be preserved if it were rendered negatively electrical, as would be done by fixing "protectors" of zinc to the sheathing. This method was tried on several ships, but it was found that the bottoms became extremely foul from accumulations of seaweed and shellfish. For this reason the admiralty decided against the plan. In 1826 Davy's health, which showed signs of failure in 1823, made rest necessary. The following years were spent chiefly abroad, and he died where he lies buried, at Geneva on May 29, 1829. On this journey he wrote his *Consolations in Travel* (1830).

Of a sanguine, somewhat irritable temperament, Davy displayed characteristic enthusiasm and energy in all his pursuits. As is shown by his verses (all his life he found solace in writing verse) and sometimes by his prose, his mind was highly imaginative, the poet Coleridge declared that if he "had not been the first chemist, he would have been the first poet of his age," and Southey said that "he had all the elements of a poet, he only wanted the art." In spite of his ungainly exterior and peculiar manner, his happy gifts of exposition and illustration won him extraordinary popularity as a lecturer, his experiments were in genius and rapidly performed, and Coleridge went to hear him "to increase his stock of metaphors." Though his ambition some times betrayed him into petty jealousy, it did not leave him insensible to the claims on his knowledge of the "cause of humanity," to use a phrase often employed by him in connection with his invention of the miners' lamp.

Paris, *The Life of Sir Humphry Davy* (1831); John Davy, *Memoirs of Sir Humphry Davy* (1836); *Collected Works* (with shorter memoir, 1839); *Fragmentary Remains, Literary and Scientific* (1858); T. E. Thorpe, *Humphry Davy, Poet and Philosopher* (1896); J. C. Gregory, *The Scientific Achievements of Sir Humphry Davy* (1930); W. Tilden, *Famous Chemists* (1921); W. Ostwald, in Bugge's *Das Buch der grossen Chemiker* (1930).

DAVY LAMP If a piece of metal gauze is interposed between a flame and an explosive gaseous mixture, the heat of the flame is absorbed and conducted away by the metal gauze so that the gaseous mixture does not explode. That is the principle of the Davy lamp, which was invented by Sir Humphry Davy in 1816. The Davy lamp consisted of a small cylindrical oil lamp, covered with a cylinder of wire gauze about 6 in. long and 1½ in. in diameter, with a flat gauze top. The upper part of the gauze was doubled to prevent it from being worn into holes by the products of combustion. The gauze was mounted in a frame of upright wires screwed into a brass ring at each end. The upper ring carried the handle, and the lower one was screwed to a collar on the oil vessel at the bottom of the lamp. Thus encircled with a case of metal gauze, the flame or gases could not pass out at a temperature high enough to fire an explosive mixture in the mine. For the subsequent developments of this invention, see **SAFETY LAMP**.

DAWARI or **DAURI**, a Pathan tribe on the Waziri border of the North-West Frontier Province of India. The Dawaris inhabit the Tochi Valley (q.v.), otherwise known as Dawar or Daur, and are a homogeneous tribe of considerable size.

DAWES, CHARLES GATES (1865-1951), U. S. statesman and financier, was born in Marietta, O., on Aug. 27, 1865, the son of Gen. Rufus R. Dawes. He was educated in his home town, graduating at Marietta college in 1884 at the early age of 19. He then attended the Cincinnati law school and in order to defray his expenses obtained employment during his vacation on the Marietta, Columbus, and Northern Ohio railway. Before finishing his two-years law course he was made chief engineer in charge of construction on this railway—a fact eloquent of the energy and versatility which were to distinguish his whole career. He graduated in 1886, before he was old enough to practise. Admitted to the bar several months later, he commenced practice at Lincoln, Neb., in 1887.

Dawes' reputation as a lawyer was established by his part in the Nebraska rate case, in which he appeared successfully as counsel for the Lincoln board of trade in an effort to obtain a reduction in railway rates in Nebraska. In 1894 he became ex-

tensively interested in the gas business at Evanston, Ill., and at other western points, and removed to Evanston in that year. In 1896 he organized the movement in Illinois to nominate William McKinley as Republican candidate for the presidency. He was active in securing McKinley's nomination and election and was chosen a member of the executive committee of the Republican national committee. He was appointed controller of the currency by President McKinley on Jan. 1, 1898. His tenure of office was conspicuous for efficiency of administration and disregard of "red-tape" methods, especially in the conduct of the many receiverships and trusts created by the financial disorders following 1893. Retiring from this office in 1902, he organized the Central Trust Co. of Illinois, which, under his presidency, became one of the strongest financial institutions in Chicago.

On the declaration of war against Germany by the United States (April 6, 1917) Dawes volunteered for service and was given a commission as major and later as lieutenant colonel of the 17th Engineers (Railway), his well known ability and early experience in railway construction outweighing the fact that he was over age. He landed in France July 17, and was placed on the headquarters staff of the AEF by General Pershing as chairman of the general purchasing board and chief of supply procurement, charged with the duty of collecting supplies in Europe and of co-ordinating their purchase in such a way as to guard against inflated prices and duplication of orders. His conspicuous success in directing these transactions, which secured for the U.S. army 10,000,000 ship tons of supplies in Europe as against 7,000,000 shipped to it from the United States, led to his promotion to the rank of brigadier-general in 1918. On the unification of command of the Allied forces under Foch, General Dawes was appointed as U.S. member of the Military Board of Allied Supply, the organization of which had been largely due to his efforts. This board for the last four months of World War I co-ordinated the movement of supplies for the Allied armies in the zone of the advance.

After the conclusion of the Armistice, Dawes became a member of the liquidation committee of the AEF, charged with the task of disposing of the huge accumulations of U.S. property in France and of settling outstanding claims against the army. This engaged his efforts until Aug. 1919, when he resigned his commission and returned to the United States. Upon the creation of a budget bureau by congress, June 1921, the directorship of it was offered to General Dawes by President Harding and was accepted on condition that the bureau should be nonpolitical, that in gathering information the director should be assumed to be acting for the president and his calls for consultation or information should take precedence of all others. His work in organizing this bureau and creating under executive order the existing system of co-ordinating boards operating in government business was carried through with characteristic vigour and directness that resulted in savings estimated officially at \$250,000,000 in the first year. Having completed the task of placing the budget on a satisfactory and permanent basis, he resigned his position on June 30, 1922.

In the meantime the collapse of the German financial structure and international reactions resulting therefrom had precipitated a crisis in European affairs, the outcome of which appeared ominous. At this juncture, the Allied Reparations commission, in 1923, appointed General Dawes and Owen D. Young as U.S. members of the committee of experts to report upon means of balancing Germany's budget and stabilizing its currency. Dawes was selected as chairman, and the committee's report, known as the "Dawes Plan," was accepted by all the powers concerned. By making the actual transfer of reparation payments conditional on the stability of the German exchange, this plan provided a nonpolitical and automatic means for determining Germany's ability to pay, and so withdrew this vexed question from international controversy and paved the way for the later agreement, entered into at Locarno (See REPARATIONS).

At the Republican national convention held at Cleveland, O., June 10-12, 1924, following the nomination of President Coolidge for re-election, General Dawes was nominated for vice president on the third ballot by a vote of 6821 against 3141 for Herbert

Hoover and 75 for Judge Kenyon. Following the overwhelming triumph of the Republican ticket at the ensuing election General Dawes assumed office on March 4, 1925. In his inaugural speech he called for a revision of the rules of procedure in the senate so that a majority vote could apply the closure to debate. He later carried his proposals for senatorial reform before the people in a series of public meetings in various parts of the country.

Another aspect of General Dawes's character is revealed by two acts of philanthropy. In memory of his son, Rufus Tearing, who was accidentally drowned (Sept. 5, 1912) he established the Rufus F. Dawes hotels in Chicago and Boston, at which impoverished men could obtain food and accommodation at nominal rates. As a memorial to his mother he established the Mary Gates Dawes memorial hotel, where women might live cheaply and retain the physical comforts and social opportunities compatible with self-respect. In the course of his varied and successful career as engineer, lawyer, politician, controller of the currency, public utility operator, banker, philanthropist, soldier, organizer of the government budget, leading spirit in the settlement of German reparations and vice president of the United States General Dawes also became an accomplished musician on the piano and flute. He was U.S. ambassador to Great Britain (1929-32) and was awarded the 1925 Nobel peace prize jointly with Sir Joseph Austen Chamberlain. He died in Evanston, Ill., on April 23, 1951.

Dawes wrote *The Banking System of the United States and Its Relation to the Money and Business of the Country* (1894), *Essays and Speeches* (1915), *A Journal of the Great War* (1921), *Notes as Vice President, 1928-1929* (1935), and *Journal of Reparations* (1938). (O. D. V. X.)

DAWES, RICHARD (1708-1766), English classical scholar, was born in or near Market Bosworth. He was elected fellow of Emmanuel college, Cambridge, in 1731. From 1738 to 1749 he was master of the Newcastle grammar school. The book on which his fame rests is his *Miscellanea critica* (1745), which gained the commendation of such distinguished Continental scholars as L. C. Valckenær and J. J. Reske. The *Miscellanea*, which was re-edited by T. Burgess (1781), G. C. Harles (1800) and T. Kidd (1817), will remain an enduring monument of English scholarship, although some of the "canons" have been proved untenable.

DAWES PLAN see REPARATIONS

DAWISON, BOGUMIL (1818-1872), German actor, was born at Warsaw, of Jewish parents, and at the age of 19 went on the stage. In 1839 he received an appointment to the theatre at Lemberg in Galicia. In 1847 he played at Hamburg with marked success, was from 1849 to 1854 a member of the Burg theatre in Vienna, and then of the Dresden court theatre. He died in Dresden on Feb. 1, 1872. Dawison was considered in Germany an actor of a new type, a leading critic wrote that he and Marie Seebach "swept like fresh gales over dusty tradition." His chief parts were Mephistopheles, Franz Moor, Mark Anthony, Hamlet, Charles V., Richard III and King Lear.

DAWKINS, SIR WILLIAM BOYD (1837-1929), English geologist and archaeologist, was born at Buttington vicarage near Welshpool. Educated at Rossall school and Oxford, he joined the Geological survey in 1862, and in 1870 became curator of the Manchester museum, a post which he retained till 1890. He was appointed professor of geology and palaeontology in Owens college, Manchester, in 1872. He paid special attention to the question of the existence of coal in Kent, and in 1882 was selected by the Channel Tunnel committee to make a survey of the French and English coasts. He was also employed in the scheme of a tunnel beneath the Humber. His chief distinctions, however, were won by his researches into the lives of the prehistoric cave dwellers described in *Cave-hunting* (1874), *Early Man in Britain* (1880), *British Pleistocene Mammalia* (1866-87). He was knighted in 1919, and died on Jan. 15, 1929.

DAWLISH, urban district and seaside resort, Tiverton parliamentary division, Devon, England, on the English channel at the mouth of Dawlish brook, 12 m. S. from Exeter by G.W. rail way. Population (1951) 7,512. Area, 9.5 sq. mi. It lies on a cove sheltered by two headlands, and both sides of the Dawlish brook are lined by pleasure grounds. The warm climate and excellent bathing attract many visitors in spring and early summer. It holds

an annual fair on Easter Monday and a regatta in August or September. Until its sale, in the 19th century, the site of Dawlish belonged to Exeter cathedral from 1050.

DAWN, the time when light appears (*daws*) in the sky. The dawn colours appear in the reverse order from those of the sunset. When the sun is lowest in both cases the colour is deep red, this gradually changes through orange to gold and yellow as the sun nears the horizon. This is their order of refrangibility, in the spectrum, the blue rays usually are scattered in the sky. The colours of the dawn are purer and colder than the sunset colours as the reduced dust content of the atmosphere causes less sifting of the light rays.

DAWSON, GEORGE GEOFFREY (1874-1944), editor of the *Times*, 1912-19, and from 1923 until his retirement in 1941. He was educated at Eton and Magdalen college, Oxford, and was elected a fellow of All Souls college in 1900. Passing into the civil service, he went to South Africa in 1901 as private secretary to Lord Milner, then high commissioner. On Lord Milner's retirement from the high commissionership in 1905 he accepted the editorship of the *Johannesburg Star*, which he held for the next four years. Returning to London in 1910, he was appointed a director of the *Times*, which was then in the early days of Lord Northcliffe's direction, and in 1912 succeeded G. E. Buckle as editor. The conspicuous success which the *Times* attained during the difficult years of World War I was largely due to Dawson's sound judgment and knowledge of affairs, which formed an admirable and often very necessary complement to Lord Northcliffe's imagination and genius. In 1919, however, Dawson found himself unable to carry out Lord Northcliffe's policy for the *Times* and resigned. He was succeeded by Henry Wickham Steed (qv). When in consequence of Lord Northcliffe's death in 1923 the *Times* was reconstructed, Stead retired and Dawson was recalled to the editorship. He had been estates bursar of All Souls college (1919-23) and secretary to the Rhodes Trust (1921-22). In 1917 he changed his name by royal licence from Robinson to Dawson. He died Nov. 7, 1944.

DAWSON, SIR JOHN WILLIAM (1820-1899), Canadian geologist, was born at Pictou, Nova Scotia, on Oct. 30, 1820. He was educated at Edinburgh, Scotland, and on his return to Nova Scotia in 1842 he accompanied Sir Charles Lyell on his first visit to that territory. He was superintendent of education (1850-53), at the same time he studied the geology of the country, making a special investigation of the fossil forests of the coal measures. From these strata, in company with Lyell (during his second visit) in 1852, he obtained the first remains of an "air breathing reptile" named *Dendropteron*. He also described the fossil plants of the Silurian, Devonian and Carboniferous rocks of Canada for the geological survey of that country (1871-73). From 1855 to 1893 he was professor of geology and principal of McGill university, Montreal. He was elected F.R.S. in 1862 and knighted in 1884. Dawson published, besides other works, *Acadian Geology. The Geological Structure, Organic Remains and Mineral Resources of Nova Scotia, New Brunswick and Prince Edward Island* (1855, ed. 3, 1878), *Air Breathers of the Coal Period* (1863). He died on Nov. 20, 1899.

His son, **GEORGE MERCER DAWSON** (1849-1901), was born at Pictou on Aug. 1, 1849, and received his education at McGill university and the Royal School of Mines, London. In 1873 he was appointed geologist and naturalist to the North American boundary commission, and two years later he joined the staff of the geological survey of Canada, of which he became assistant director in 1883 and director in 1895. He was in charge of the Canadian government's Yukon expedition in 1887, and his name is commemorated in Dawson City, of gold-bearing fame. He was one of the Bering Sea commissioners in 1891. He was elected F.R.S. in 1891, and was president of the Royal Society of Canada in 1893. He died on March 2, 1901. He was the author of many scientific papers and reports on the surface geology and glacial phenomena of the northern and western parts of Canada.

DAWSON or **DAWSON CITY**, in the Yukon territory, Canada, on the bank of the Yukon river, and in the middle of the Klondike gold region, of which it is the distributing centre. It is in beauti-

ful mountainous country, 1,049 ft. above the sea and 1,500 mi. from the mouth of the Yukon river, and is reached by river steamer from Whitehorse (460 mi.) in summer, and by tractors and aeroplanes in winter. There are metalworks and sawmills.

Order is kept by the Royal Canadian mounted police. The city was founded in 1896, its population soon reached more than 30,000 at the height of the gold rush, in 1901 it was 9,142. In 1941, 1,043, and in 1951, 773. The record of temperature varies from 83° F. in summer to -60° in winter. (See *YUKON TERRITORY* and *NORTHWEST TERRITORIES*.)

Dawson was named for George M. Dawson, director of the Canadian geological survey. In 1898 the town became the administrative centre of Yukon territory, but in 1951 the seat of government was shifted to Whitehorse. Jack London, Robert Service and Rex Beach were among the inhabitants of the town in its boom days and later wrote of the robustness of the period of the gold rush. The town was severely damaged by fire in 1898 and 1899.

DAWSON-WATSON, DAWSON (1864-1939), U.S. artist, was born at London, England, July 21, 1864. He studied art under Mark Fisher and others in England and moved in 1893 to the United States to become art director of the Hartford (Conn.) Art society. Later he taught at the Byrdcliffe colony, Woodstock, N.Y., and from 1904 to 1915 at the St. Louis (Mo.) School of Fine Arts, he also was art director of the St. Louis Industrial exhibition in 1914 and the St. Louis centennial exhibition in 1918.

Aside from his paintings in oil and water colour, he designed textiles and costumes and was a wood carver and mezzotint engraver. He died at San Antonio, Tex., Sept. 3, 1939.

DAX, a town of southwestern France, capital of an *arrondissement* in the department of Landes, 92 mi. SSW of Bordeaux, on the Southern railway between that city and Bayonne. Pop. (1946) 4,113. It lies on the left bank of the Adour, and its suburb, Le Sablar, on the right. Its ancient Gallo-Roman fortifications are now a promenade. *Dax* (*Aquae Tarbellicae*, *Aquae Augustae*, later *D'Acs*) was the capital of the Tarbelli in Roman times, when its waters were already famous. In the 11th century its viscosity passed to the viscounts of Béarn and in 1177 was annexed by Richard Coeur de Lion to Gascony. The bishopric, founded in the 3rd century, was in 1801 attached to that of Aire. The church of Notre Dame, once a cathedral, was rebuilt from 1656 to 1710, but still preserves a sacristy, a porch and a fine sculptured doorway of the 13th century. The church of St. Paul-le Dax, mainly 15th century, has a Romanesque apse with curious bas-reliefs. Dax, well known as a winter resort, has thermal waters and mud baths (the deposit of the Adour). The principal of numerous bathing establishments are the Grands Thermes, the Bains Salés, adjoining a casino, and the Baugnots, which fringe the Adour and are surrounded by gardens. Dax has a subprefecture and tribunals of first instance and of commerce. Commerce is chiefly in the pine wood, resin and cork of the Landes, and in mules, cattle and horses. Dax was occupied by Germany in June 1940.

DAY, JOHN (1574-1640?), English dramatist, was born at Cawston, Norfolk, in 1574, and educated at Ely. He became a sizar of Caius College, Cambridge, in 1592 but was expelled in the next year for stealing a book. As early as 1598 he became one of Henslowe's playwrights, collaborating with Henry Chettle, William Haughton, Thomas Dekker, Richard Hathway, and Wentworth Smith, but his almost incessant activity seems to have left him poor enough, to judge by the small loans, of five shillings and even two shillings, that he obtained from Henslowe. The first play in which Day appears as part author is *The Conquest of Brute*, with the *Finding of the Bath* (1598), which, with most of his journeyman's work, is lost. *The Isle of Gulls* (printed 1606), a prose comedy founded upon Sir Philip Sidney's *Arcadia*, contains in its light dialogue much satire to which the key is now lost. In 1607 Day produced, with William Rowley and George Wilkins, *The Travels of the Three English Brothers*, which detailed the adventures of Sir Thomas, Sir Anthony and Robert Shirley. The work on which Day's reputation chiefly

rests in the *Parliament of Bees*. This exquisite masque, or rather series of pastoral eclogues, is entirely occupied with "the doings, the births, the wars, the wooings" of bees. The bees hold a parliament under Prorex, the Master Bee, and various complaints are preferred against the humble bee, the wasp, the drone, and other offenders. This satirical allegory of affairs ends with a royal progress of Oberon, who distributes justice to all. There is no earlier edition of *The Parliament of Bees* than that in 1641, but a persistent tradition has assigned the piece to 1607. In 1608 Dry published two comedies, *Law Tricke*, or, *Who Would have Thought it?* and *Humour out of Breath*. The date of his death is unknown, but an elegy on him by John Tatham, the city poet, was published in 1640. The six dramas by John Day which we possess show a delicate fancy and dainty incoherence all his own. The beauty and ingenuity of *The Parliament of Bees* were noted and warmly extolled by Charles Lamb, and Day's work has since found many admirers.

His works, edited by A. H. Bullen, were printed at the Chiswick Press in 1881. The same editor included *The Mayday Metamorphosis* in vol. 1 of his *Collection of Old Plays*. *The Parliament of Bees* and *Humour out of Breath* were printed in *Nero and other Plays* (Mermaid Series 1888), with an introduction by Arthur Symonds. An appreciation by Mr. A. C. Swinburne appeared in *The Nineteenth Century* (Oct. 1897).

DAY, THOMAS (1748-1789), British author, was born in London and is famous as the writer of *Sandford and Merton* (1783-89), a book for the young. Day was educated at the Charterhouse and at Corpus Christi College, Oxford, and became a great admirer of J. J. Rousseau and his doctrine of the ideal state of nature. Having independent means he devoted himself to a life of study and philanthropy. He brought up two foundlings, one of whom he hoped eventually to marry, on the severest principles, but neither acquired the high quality of stoicism which he had looked for, and ultimately he married an heiress who agreed with his ascetic programme of life. He settled in 1781 at Otter shaw, in Surrey, and took to farming on philanthropic principles. His poem "The Dying Negro" (1773) struck the keynote of the anti-slavery movement.

DAY, in astronomy, the interval of time in which a revolution of the earth on its axis is performed. Days are distinguished as solar, sidereal or lunar, according as the revolution is taken relatively to the sun, the stars or the moon. The solar day is the fundamental unit of time in daily life and in astronomical practice. In the latter case, being determined by observations of the sun, it is taken to begin with the passage of the mean sun over the meridian of the place, or at mean noon, while the civil day begins at midnight.

The question of a possible variability in the length of the day is one of fundamental importance. One necessary effect of the tidal retardation of the earth's rotation is gradually to increase this length. It is remarkable that the discussion of ancient eclipses of the moon, and their comparison with modern observations, show only a small and rather doubtful change, amounting perhaps to less than one hundredth of a second per century. As this amount seems to be less than that which would be expected from the cause in question, it is probable that some other cause tends to accelerate the earth's rotation and so to shorten the day. (See *MOON* and *TIDES*.)

Legal Aspects—In law, a day may be either a *dies naturalis* or natural day, or a *dies artificialis* or civil day. A natural day includes all the 24 hours from midnight to midnight. Fractions of the day are disregarded to avoid dispute, though sometimes the law will consider fractions, as where it is necessary to show the first of two acts of events. In cases where action must be taken for preserving or asserting a right, a day means the whole natural day of 24 hours.

When a statute directs any act to be done within so many days, these words mean *clear days*, i.e., a number of perfect intervening days, not counting the terminal days if the statute says nothing about Sunday, the days mentioned mean consecutive days and include Sundays. Under some statutes Sundays and holidays are excluded in reckoning days, and consequently all the Sundays, etc., of a prescribed sequence of days would be eliminated. By

contrast, the word "day" may be understood in some special sense.

Lay Days, which are days given to the charterer in a charter party, either to load or unload without paying for the use of the ship, are days of the week, not periods of 24 hours. As to lay days, running days, working days and weather working days, see **AFFREIGHTMENT**. For days of grace see **BILL OF EXCHANGE**.

Civil Days—An artificial or civil day is difficult to define, it is a convenient term to signify the various kinds of "day" known in legal proceedings other than the natural day. In England, the United States and most of the countries of Europe the Roman civil day still prevails, the day commencing at 12 p.m.

In England the period of the civil day may and does vary under different statutes. Daytime, within which distress for rent must be made, is from sunrise to sunset. An obligation to pay money on a certain day is discharged if the money is paid before midnight of the day on which it falls due, but the law requires reasonable hours to be observed. If, for instance, payment has to be made at a bank or place of business, it must be within business hours.

When an act of parliament is expressed to come into operation on a certain day, it is to be construed as coming into operation on the expiration of the previous day. (Interpretation Act 1889, § 36, Statutes [Definition of Time] Act 1880.)

Under the orders of the supreme court the word "day" has two meanings. For purposes of personal service of writs, it means any time of the day or night on week days, but excludes the time from 12 midnight on Saturday till 12 midnight on Sunday. For purposes of service not required to be personal, it means before six o'clock on any week day except Saturday, and before 2 p.m. on Saturday.

Closed Days, i.e., Sunday, Christmas day and Good Friday, are excluded from all fixtures of time less than six days; otherwise they are included, unless the last day of the time fixed falls on one of those days (R.S.C. O. lxxv). See **ENGLISH LAW**.

DAYAKS or **DYAKS** a name used by some people (especially Dutch ethnographers) for all the indigenous tribes of Borneo, but more usually applied to the Sea Dayaks or Iban and to the Land Dayaks. (See **BORNEO**). (B. A. L. C.)

DAY BED, a small type of French couch bed, intended to serve as a bed at night and as a sofa during the day. The standard day bed is narrow, with foot and head pieces identical in size and appearance. Because of the convenience of its size the day bed came into wide use in small apartments where every effort must be made to conserve space. It was especially popular in the large cities of the United States. The low and symmetrical head and foot pieces give it the appearance of a divan, thus serving to conceal to some degree the fact that the living room in which it appears is converted at night into a bedroom.

DAYE, STEPHEN (c. 1594-1668), first printer in the Anglo-American colonies, was born in London. Although it has been stated that he served an apprenticeship as a printer there, the records extant indicate that he was a locksmith. In the summer of 1638, however, he went to America with the Rev. José Glover, a dissenting minister of some means, with whom he made a contract to set up the first printing press in the English colonies. This he did in the autumn of 1638 at Cambridge, Mass. The first issue from his press was the *Freeman's Oath* (Jan. 1639), the second, an *Almanack* by William Pierce, mariner (1639), the third, the *Psalms*, now known as the *Bay Psalm Book* (1640). According to the records of the general court of Cambridge, Dec. 10, 1641, he was granted 300 ac. of land for "being the first that sett up printing." His name is not found in connection with the imprint of any of his publications, but that of his son, Matthew, who seems to have been next in charge of the press, appears on the title page of the *Almanack* (1647). The extant issues from his press are *The Whole Booke of Psalms, faithfully translated into English Metre* (1640), *A list of Theses at the Harvard Commencement in 1643* (1643), *A Declaration of Former Passages and Proceedings betwixt the English and the Narragansett, with their confederates, Wherein the grounds and justice of the ensuing warre are opened and cleared* (1645). He died at Cambridge, Mass., on Dec. 22, 1668.

DAYFLOWER, rather weedy, quick wilting plants of the genus *Commelina* of the spiderwort family (*Commelinaceae*). There are about 115 species chiefly natives of tropical and sub-tropical regions, 8 of which are found in the southern United States. They are usually ascending or reclining somewhat fleshy, branching herbs, with short stalked leaves and irregular, usually blue ephemeral flowers in small clusters more or less enfolded in two spathe-like bracts. The Virginia dayflower (*C. virginica*), found in moist places from southern New York to Illinois southward to Florida and Texas and thence to Paraguay, has diffusely branching stems, $1\frac{1}{2}$ ft to 3 ft high, lance shaped leaves and showy blue flowers an inch broad. The creeping dayflower (*C. nudiflora*), with reclining stems 1 ft to $2\frac{1}{2}$ ft long, rooting at the joints, and small blue flowers about $\frac{1}{2}$ in. broad, found from New Jersey to Missouri and southward is extensively distributed also in South America, Asia and Africa. The Asiatic dayflower (*C. communis*), with small, very deep blue flowers, has become widely naturalized in the eastern and southern states.

DAYLESFORD, a town 60 mi NW of Melbourne, Austr. Pop. (1947) 3,053. It lies on the main divide of the state, at an elevation of 2,030 ft. Much wheat is grown in the district, gold mining both quartz and alluvial, is carried on, and there is a mining school. Near the town are the Hepburn mineral springs.

DAYLIGHT, ARTIFICIAL The wide use of artificial light in civilization created a demand for lamps which show coloured objects truthfully, i.e., which do not change colours from their hues as seen by daylight. The problem is thus one of producing an artificial light whose spectrum (see LIGHT) closely resembles that of sunlight. Artificial light always contains too high a proportion of red, orange and yellow rays.

A gas filled electric lamp is employed, as its filament temperature is high and its form the most economical. The spectrum obtained from a black body, heated to $5,000^{\circ}\text{C}$, is found to be approximately that of average diffused daylight. According to the temperature at which the filament of an incandescent electric lamp burns, the amount of red and orange contained in the spectrum of its light varies, becoming greater as the temperature is lowered, a metal filament bulb burns at $2,200^{\circ}$ and has more red and orange in it than the gas filled bulb, which burns at approximately $3,000^{\circ}$. Therefore, the gas filled bulb is used in artificial daylight devices, but its light has to be subjected to special treatment to correct its undue yellowness and redness.

Various means are employed for this purpose, such as filtering the light through a coloured transparent medium (i.e., glass, talc or varnish) or by the use of a coloured reflector or by a series of coloured mirrors fixed in a reflector. Coloured reflectors with certain pigments have proved successful, and by this means it is possible to match practically any type of daylight, but this method absorbs a very large quantity of the initial illumination. By the use of tinted or coloured glasses, one or more different colours being placed one behind the other, the same effect can be obtained, the loss of light by this method, however, is not so high as in the former. Artificial daylight was at first mainly used for the purpose of matching colours. It came into use for general illumination, however, as the value of artificial daylight in resting the eyes became appreciated. Hospital staffs, dentists, physicians and surgeons find artificial daylight of great value. The method is also employed in dye and colour works. See LIGHTING AND ARTIFICIAL ILLUMINATION.

DAYLIGHT SAVING In the second year of World War I nearly every country in Europe adopted the device of putting the clock forward an hour during the spring, summer and autumn months. Action in the United States came somewhat later (see below). The motive was to save fuel for lighting and heating by getting people up and getting them to bed an hour earlier.

Great Britain—In Great Britain the idea originated about 1907 with William Willett, a Chelsea builder. Declaring that civilization got up an hour or two too late in the summer months and had only a short evening for outdoor recreation, he ran and financed a campaign for putting the clock ahead by 80 min. in

four moves of 20 min. each in the spring and summer months. In 1908 Robert (afterward Sir Robert) Peirce introduced a bill in the house of commons to put the clock ahead by law. In 1916 the expert committee set up by the British government to study the question of fuel economy advised that the measure should be adopted. The scheme was simplified. A select committee in 1909 had advocated in advance of the clock by one hour in the spring and the return to Greenwich mean time in the autumn. This was the method adopted by the act passed on May 17, 1916, and put into operation the following Sunday, May 21. There was a good deal of opposition. Farmers objected to it because milkers would have to get up in the dark during the greater part of the year and labourers in the hay and corn harvests would waste an hour waiting until the dew had dried off. When put to the test of practice these difficulties proved to have been exaggerated. Summer time was renewed after World War I by acts of parliament that of 1922 provided that summer time should begin on the day next following the third Saturday in April, or if that day is Easter day the day next following the second Saturday in April, and end on the day next following the third Saturday in September. The act of 1915 altered the closing date to the day following the first Saturday in October. The official time for altering the clock is always 2 A.M. Greenwich mean time. Nothing in the acts affects the use of Greenwich mean time for the purposes of astronomy, meteorology or navigation and they apply to Northern Ireland, the Channel Islands and the Isle of Man as well as Great Britain.

Soon after World War II began it was found necessary to modify the date in order to assist war production, and emergency powers were granted under the Defence (Summer Time) regulations. Further powers given in 1941 allowed the introduction of double summer time, i.e., two hours in advance of Greenwich mean time. The periods were varied from year to year to meet national requirements, single summer time remained in force throughout the winters of 1940–44 inclusive. Double summer time ended in 1945, was reintroduced in 1947 but then discontinued. A further act passed in 1947 renewed the wartime powers of prescribing summer time dates by order in council, but these are exercised only when there are special reasons (e.g., fuel crises) which would justify the use of this exceptional procedure, and any permanent change would require further legislation. The statutory dates were resumed in 1953. (J. CL.)

United States—No public interest was developed in the project in the United States till after the outbreak of World War I, and it was not until 1916 that a nation wide campaign was initiated in its support. Opinion was divided but in 1917 congress passed an act, to take effect in 1918, whereby the standard time of the United States would be advanced one hour on the last Sunday in March and set back one hour on the last Sunday in October. The act was effective from March 31 till Oct. 27, 1918, and again on March 30, 1919. Strenuous opposition developed, however, from the farmers, and the law was repealed on Aug. 20, 1919, over the president's veto. Legislation on the subject was somewhat intermittent in the following decade, although daylight time was made obligatory by state law in Massachusetts and Rhode Island and by municipal ordinance in the New York metropolitan district, Chicago, Philadelphia and a number of other cities and towns. On Feb. 6, 1942, "war time," one hour in advance of standard time, was put into effect nationally and continued to the end of Sept. 1945.

At mid-20th century, daylight saving time was observed, at least in part, in the following states, usually from the last Sunday in April to the last Sunday in September: California (state wide by law), Connecticut (state law), Delaware, Illinois, Kentucky, Maine, Maryland (also District of Columbia), Massachusetts (state law), Missouri, Montana, Nevada (entire state), New Hampshire (state law), New Jersey, New York, Ohio, Oregon (entire state), Pennsylvania, Rhode Island (state law), Vermont, Virginia, Washington and West Virginia.

Other Countries—In the years following World War II a number of nations adopted summer time in whole or in part, including the following: Brazil, Canada, China, Germany, Hungary, Japan, Poland, Portugal, Union of South Africa and Turkey.

In 1784 Benjamin Franklin urged a similar proposal on the French people to conserve tallow and enjoy more daylight.

DAY NURSERIES These institutions, of a semi philanthropic nature, formerly known as "crèches" (from the Fr. *crèche*—crib) but now as "day nurseries," form an integral part of the public health work of Great Britain, the United States, and other industrial countries.

Their original intention was to assist widows, and other women whose circumstances obliged them to go out to work, by caring for their young children, under school age, during the day. During the 19th century France and Belgium had many crèches, but they were on a very simple scale. A "motherly" woman was put in charge of two or three rooms and for very small fees the working mothers could leave their children to be fed and cared for during the day. This system proved unsatisfactory, want of technical knowledge and insufficient sanitary precautions led to the spread of infection and the crèche soon got a bad name. But with the increase in the knowledge and study of "mothercraft" and infant welfare, which coincided roughly with the early years of the 20th century, day nurseries were brought to England, and to the United States, and organized on modern and hygienic methods, very different from those of the old crèches. The value of fresh air and "moving" air was increasingly appreciated and open air nurseries were built in London, Manchester and elsewhere.

In Great Britain the movement is largely associated with the names of Mrs. Arthur Percival and Muriel, Viscountess Helmsley, who founded the National Society of Day Nurseries with the objects of starting nurseries, raising the standard of existing crèches, putting them in close touch with the government departments, and "standardizing" the training of staffs.

The movement, like many other branches of the infant welfare movement, originated in private enterprise and the day nursery was generally started by a voluntary committee. From the year 1915 a grant in aid was given by the board of education. When, in 1918, the local government board was merged in the ministry of health, day nurseries were placed under its maternity and child welfare department.

The ministry inspects the nurseries at regular intervals and gives a grant proportionate to the expenses incurred, in certain cases grants are also made toward capital expenditure, such as the purchase of premises, etc. The cost of upkeep is met by the parents' payments (1s a day is a common charge), the government grant, private subscriptions and, in some cases, a municipal grant. Local authorities have the power to provide day nurseries.

Children are received from the age of one month, until they attain school age. The mother brings the child in the early morning on her way to work and calls for it on her return in the evening. The child is inspected on arrival by the crèche trained matron and, if found to be free from any signs of infection, is bathed, dressed in the nursery clothes and cared for during the day in accordance with the requirements of its age. The infants have cots and the necessary food and sleep, the older children or "toddlers" have three good meals and plenty of opportunity for fresh air, rest and exercise. The mental development of the toddlers is assisted by "nursery school classes," under the supervision of a specially trained member of the staff. The furnishing of the nursery is of great importance, small tables and chairs are provided for meals, etc., and stretchers for rest. The staff generally consists of a matron and sister with "nursery" training and some hospital experience, a toddlers' nurse, young probationers and a cook.

The health of the children is under the daily care of the matron, who weighs the children weekly or fortnightly, accurate records are kept and are seen by the visiting doctor at the fortnightly medical inspection. The previous medical history of the child, if it has attended the infant welfare centre, is used for reference and the nursery record is available for the school doctor when the child leaves the nursery. In this way a complete record can, in some cases, be obtained of the child's medical history. A great point is made of the clothing and feeding of the children in the nursery, it is held that the nurseries are in this way of great educational value to the mothers.

Probationers in day nurseries are trained on a syllabus prepared by the National Society of Day Nurseries in conjunction with the

National League for Health, Maternity and Child Welfare. They attend certain lectures and then sit for a series of examinations. The successful candidates who can show evidence of satisfactory practical work then obtain a certificate of proficiency in the care of children. These girls are then fitted to become "nursery nurses" in private posts or public institutions, and the scheme of training is approved by the ministry of health.

Since 1919 the headquarters of the National Society of Day Nurseries has been under the same roof as many other organizations for infant and child welfare at Carnegie House, 117 Piccadilly, London. The society publishes a monthly magazine *Crèche News* (N. L. H.).

United States—The day nursery movement in America has followed rather different lines, but there, even more than in England, its value is recognized as an essential part of child welfare. Inspection varies and may be under the control of state, county or city departments of health or welfare, but no government grant is given and the nurseries are supported by voluntary subscription, supplemented by parents' fees. Some states license the day nurseries, inspect periodically and require minimum standards. Progressive nurseries include programs of family case work, health and education. The first day nursery in America opened in New York in 1854, but the actual movement dates from conferences held 1892-1898. The National Federation of Day Nurseries, organized in 1898, was superseded in 1923 by the National Association of Day Nurseries, a consolidation of the federation and the New York Association of Day Nurseries. The national association serves as a coordinating body for day nurseries, raises standards, provides field service and information, and issues publications including a bulletin *The Day Nursery Headquarters*, 122 East 22nd street, New York.

As regards other countries the tendency of the present day is to establish day nurseries in connection with infant welfare work and nursery schools. In France the "Crèches d'Arrondissement" of 19th century Paris have been largely superseded by nurseries connected with large factories and shops, or department stores. These are frequently used for infants, and give special facilities to nursing mothers for the breast feeding of their own babies.

Belgium, Holland, Switzerland, Germany, India and Japan encourage the provision of day nurseries, and Poland, Serbia and Spain have followed their example.

See the publications of National Society of Day Nurseries, 117, Piccadilly, London, and of the National Association of Day Nurseries, New York *Maternity and Child Welfare Act* (1918) (A. E. B.).

DAYS OF GRACE The extra time allowed to meet the payment of a bill of exchange after its due date. In English law three days grace are thus allowed. No extra time is allowed, however, for a bill payable at sight. In the case of insurance premiums, also, days of grace are allowed before the policy actually expires.

In the United States days of grace in all bills of exchange have been abolished by the Negotiable Instruments law, except in a very few states, as to sight drafts. (See BILL OF EXCHANGE.)

DAYTON, a city of Campbell county, Ky., U.S., on the Ohio river, opposite Cincinnati, served by the Chesapeake and Ohio railway.

The population was 8,943 in 1950 and 8,379 in 1940 by the federal census. There is some manufacturing, but the city is primarily a residential suburb of Cincinnati. It was settled and incorporated in 1849.

DAYTON, a city of southwestern Ohio, U.S., on the Great Miami river, 55 mi NNE of Cincinnati, a port of entry, the county seat of Montgomery county, and a leading centre of aviation research.

It is served by the Baltimore and Ohio, the Big Four, the Erie and the Pennsylvania railways, by a number of air lines and by numerous motorbuses and motor truck lines operating over the hard surfaced roads which radiate in every direction.

There are three commercial and two government airports and numerous emergency landing fields. The population was 243,108 in 1950 and 210,718 in 1940 by the federal census. About 70% are natives of Ohio.

The city covers 24.24 sq mi of level ground 740 ft above sea level, in a wide river trough, where three rapid streams (Wolf creek, Stillwater river and Mad river) flow into the Miami. It is completely protected (since 1921) from all danger from floods. Boulevards and streets are wide and in the residential districts are lined with trees. The dwellings are for the most part small private houses, each with its own garden. Many of the factories are surrounded by attractive grounds.

The public parks and playgrounds comprise 1,100 ac (including 723 ac island in the Miami), and just south of the city there is a municipal country club (294 ac of natural forest) with golf courses and tennis courts. The elimination of grade crossings within the city and the construction of a boulevard on the bed of the abandoned Miami and Erie canal were begun in 1927. A comprehensive city plan was adopted in 1925.

Dayton adopted a commission manager form of government in 1914. The water supply comes from driven wells 50-100 ft deep. Natural gas is used. Electric current, steam generated is provided by a super power system, and the local power and light company furnishes steam heat to a considerable area in the central part of the city. The city has one of the few financially successful municipal garbage reduction plants. Both the death rate and the cost of living are relatively low.

The manufacturers are many and varied. Dayton has long been known as the home of the National Cash Register company. It has become the leading producer, also, of electric motors, water parts for home use, electric refrigeration equipment, fire registers, computing scales, water softeners, fan belts, automobile parts, aeroplane parts, golf clubs and ice cream cones, and it makes all the government stamped envelope. 'Precision in dustries' predominate, in which labour is more important than material, and skilled labour more important than unskilled. The percentage of women in industry is relatively low, and there is little child labour. Except in the building trades the "open shop" prevails. The making of aeroplanes at Dayton began with the experiments of Orville and Wilbur Wright (qqv) who in 1903 flew successfully the first heavier-than-air machine.

During World War I the U.S. government located its aviation experiment laboratories at McCook field, on the northern boundary of the city. When this became too small, the people of Dayton raised \$400,000 in four days to buy a tract of 5,000 ac, northeast of the city (including the Wrights' original flying field), which they presented to the war department, to be a permanent home for the experimental and research division of the air corps. The city was again a centre of military aircraft research during World War II.

The annual volume of Dayton's wholesale business is estimated at \$352,000,000, its retail trade at \$338,000,000. In 1949 bank deposits amounted to \$2,638,875,201, post office receipts were \$6,474,733, and the assessed valuation of property was \$439,447,740.

The city has 82 public schools, including a normal college, and 20 parochial schools, 202 churches, and 3 daily newspapers, one of which is in German. It is the seat of the University of Dayton, a Roman Catholic institution founded in 1850 (formerly St. Mary college), Bonebrake Theological seminary (United Brethren), and Sinclair college, also the Dayton Art institute (established 1919).

The Engineers' club and the Foremen's club are distinctive organizations. The National Association of Foremen was founded in Dayton and its official organ is published there. The first house built in Dayton, a log cabin on the bank of the Miami, is preserved as a historic museum. There is a state hospital for the insane and a large Veterans' Administration facility which was the first soldiers' home established in America (1867).

History—The site of Dayton was bought in 1795 from John Cleves Symmes by a party of Revolutionary soldiers. It was laid out as a town in 1796 by Israel Ludlow, one of the owners, and named after Jonathan Dayton (1760-1841), who had fought in the Revolution and was at the time a representative of New Jersey in congress. In 1803 it was made the county seat and in 1805 the town was incorporated. Growth was rapid after the opening

of the Miami and Erie canal in 1828, and in 1841 it was chartered as a city. By 1860 the population had reached 30,081, increasing to 38,678 in 1880, 85,133 in 1900 and 116,577 in 1910. In March 1913, the Miami valley was swept for five days by a steady down fall of rain, resulting in a great flood. Over 400 lives were lost in the valley, and damage to property was estimated at \$100,000,000. When the waters receded, Dayton was left covered with mud and debris. A pestilence was averted only by prompt and energetic measures. Mortalities were declared, food was distributed and tents were put up for the homeless. A relief fund of \$750,000 was disbursed by the American Red Cross and the Citizens Relief committee. Steps were taken to prevent the recurrence of such a disaster. On June 28, 1915, the Miami conservancy district, a political subdivision of the state, was established under a new law for the purpose of building and maintaining flood control works in the Miami valley. The plan finally adopted combined channel improvement with the construction of five great retarding basins. Five dams (from 100 to 640 ft long, from 75 to 125 ft high, and from 380 to 785 ft thick at the base) were built across the upper valleys of the Miami and four of its tributaries. Construction work began in 1918 and was completed in 1921. The cost was \$32,000,000. Protection has been provided against a flood 10% greater than that of 1913, and 20% greater than the maximum estimated to be possible. Following the flood Dayton adopted a commission manager form of government which came into effect on Jan. 1, 1914. It was the first large city to install a manager and there has been no disposition to return to the mayorality system.

For an account of the flood of 1913 and the construction of the flood control works see *Technical Reports* (10 vols.) by various authors, published by the Miami conservancy district, Dayton, O.

DAYTON, a city of southeastern Tennessee, U.S.A., 38 mi NNE of Chattanooga at the foot of the Cumberland escarpment, the county seat of Rhea county. It is served by the Southern railway. The population in 1950 was 3,191. In July 1925 the little county town was the scene of the famous "anti evolution" trial, in which John T. Scopes, a teacher of science in the high school, was found guilty of having violated a state law prohibiting the teaching, in the schools supported by the state, of any theories, to the effect "that man is descended from the lower animals". Counsel for the defense included Clarence Darrow and Dudley Field Malone. The prosecution had the support of William Jennings Bryan, who died in Dayton a few days after the close of the trial. Scopes was fined \$100, but the penalty was set aside by the state supreme court on a technicality, without any expression of opinion as to the constitutionality of the law. William Jennings Bryan university, on a hill overlooking the town, was founded by Bryan's admirers as a memorial to him.

DAYTONA BEACH, a city of Volusia county, Fla., U.S.A. on the Halifax river, 50 mi below St. Augustine, on federal highways 1 and 92 and state highway 140, and served by the Florida East Coast railway, air lines and buses. It was formed in 1925 by the consolidation of the city of Daytona and the towns of Daytona Beach and Seville, its total population in 1950 was 29,254. Daytona Beach is a popular all year resort, with many hotels and private winter homes and a summer season attracting 2,500,000 visitors. The Spanish style of architecture prevails, and the assessed valuation of property in 1950 was \$61,848,430. Along the broad, white beach which adjoins that of Ormond, is a fine automobile racing course, where many speed records have been made.

DEACON, a minister or officer of the Christian Church. The status and functions of the office have varied in different ages and churches, and the name is the Gr. *διάκονος*, minister, servant. (a) **The Ancient Church**—The office of deacon is almost as old as Christianity itself. Tradition connects its origin with the appointment of "the Seven" recorded in Acts 6:1-6. This connection, however, is questioned on the ground that "the Seven" are not called deacons in the New Testament and do not seem to have been identified with them till the time of Irenaeus (c. 180). The officers of the church are described in Philippi 1:1 as "bishops and deacons", and in 1 Tim. 3:8-13 the office of

DAY NURSERIES These institutions of a semi-philanthropic nature formerly known as "crèches" (from the Fr. *crèche*—crib) but now as day nurseries, form an integral part of the public health work of Great Britain, the United States, and other industrial countries.

Their original intention was to assist widows and other women whose circumstances obliged them to go out to work by caring for their young children, under school age, during the day. During the 19th century France and Belgium had many crèches, but they were on a very simple scale. A "motherly" woman was put in charge of two or three rooms and for very small fees the working mothers could leave their children to be fed and cared for during the day. This system proved unsatisfactory, a want of technical knowledge and insufficient sanitary precautions led to the spread of infection and the crèche soon took a bad name. But with the increase in the knowledge and study of "mothercraft" and infant welfare, which commenced roughly with the early years of the 20th century, day nurseries were brought to England, and to the United States, and organized on modern and hygienic methods, very different from those of the old crèches. The value of fresh air and "moving" air was increasingly appreciated and open air nurseries were built in London, Manchester and elsewhere.

In Great Britain the movement is largely associated with the names of Mrs. Arthur Percival and Maud Viscountess Halsbury, who founded the National Society of Day Nurseries with the objects of starting nurseries, raising the standard of existing crèches, putting them in close touch with the government departments and "standardizing" the training of staffs.

The movement, like many other branches of the infant welfare movement, originated in private enterprise and the day nursery was generally started by a voluntary committee. From the year 1915 a grant in aid was given by the board of education. When in 1918, the local government board was merged in the ministry of health, day nurseries were placed under its maternity and child welfare department.

The ministry inspects the nurseries at regular intervals and gives a grant proportionate to the expenses incurred, in certain cases grants are also made toward capital expenditure, such as the purchase of premises, etc. The cost of upkeep is met by the parents' payments (1s a day is a common charge), the government grant, private subscriptions and in some cases, a municipal grant. Local authorities have the power to provide day nurseries.

Children are received from the age of one month, until they attain school age. The mother brings the child in the early morning on her way to work and calls for it on her return in the evening. The child is inspected on arrival by the crèche-trained matron and, if found to be free from any signs of infection, is bathed, dressed in the nursery clothes and cared for during the day in accordance with the requirements of its age. The infants have cots and the necessary food and sleep, the older children or "toddlers" have three good meals and plenty of opportunity for fresh air, rest and exercise. The mental development of the toddlers is assisted by "nursery school classes," under the supervision of a specially trained member of the staff. The furnishing of the nursery is of great importance, small tables and chairs are provided for meals, etc., and stretchers for rest. The staff generally consists of a matron and sister with "nursery" training and some hospital experience, a toddlers' nurse, young probationers and a cook.

The health of the children is under the daily care of the matron, who weighs the children weekly or fortnightly, accurate records are kept and are seen by the visiting doctor at the fortnightly medical inspection. The previous medical history of the child, if it has attended the infant welfare centre, is used for reference and the nursery record is available for the school doctor when the child leaves the nursery. In this way a complete record can, in some cases, be obtained of the child's medical history. A great point is made of the clothing and feeding of the children in the nursery; it is held that the nurseries are in this way of great educational value to the mothers.

Probationers in day nurseries are trained on a syllabus prepared by the National Society of Day-Nurseries in conjunction with the

National League for Health, Maternity and Child Welfare. They attend certain lectures and then sit for a series of examinations. The successful candidates who can show evidence of satisfactory practical work then obtain a certificate of proficiency in the care of children. These girls are then fitted to become "nursery nurses" in private, public or public institutions, and the scheme of training is approved by the ministry of health.

Since 1919 the headquarters of the National Society of Day-Nurseries has been under the same roof as many other organizations for infant and child welfare, at Carnegie House, 117 Piccadilly, London. The society publishes a monthly magazine (*CRËCHE*—N. L. H.).

United States—The day nursery movement in America has followed rather different lines, but there, even more than in England, its value is recognized as an essential part of child welfare. Inspection varies and may be under the control of state, county or city departments of health or welfare, but no government grant is given and the nurseries are supported by voluntary subscription, supplemented by parents' fees. Some states license the day nurseries, inspect periodically and require minimum standards. Progressive nurseries include programs of family case work, health and education. The first day nursery in America opened in New York in 1854 but the actual movement dates from conferences held 1890-1895. The National Federation of Day Nurseries, organized in 1898, was superseded in 1908 by the National Association of Day Nurseries, a consolidation of the federation and the New York Association of Day Nurseries. The national association serves as a coordinating body for day nurseries, raises standards, provides field service and information, and issues publications including a bulletin (*The Day Nursery* Headquarters, 125 East 2nd street, New York).

As regards other countries the tendency of the present day is to establish day nurseries in connection with infant welfare work and nursery schools. In France the "Crèches d'Arrondissements" of 19th century Paris have been largely superseded by nurseries connected with large factories and shops, or department stores. These are frequently used for infants and give special facilities to nursing mothers for the breast-feeding of their own babies.

Belgium, Holland, Switzerland, Germany, India and Japan encourage the provision of day nurseries, and Poland, Serbia and Spain have followed their example.

See the publications of National Society of Day-Nurseries, 117, Piccadilly, London, and of the National Association of Day Nurseries, New York. *Maternity and Child Welfare Act* (1918). (A. B. E.)

DAYS OF GRACE The extra time allowed to meet the payment of a bill of exchange after its due date. In English law, three days grace are thus allowed. No extra time is allowed however, for a bill payable at sight. In the case of insurance premiums, also, days of grace are allowed before the policy actually expires.

In the United States days of grace in all bills of exchange have been abolished by the Negotiable Instruments law, except in a very few states, as to sight drafts. (See *BILL OF EXCHANGE*.)

DAYTON, a city of Campbell county, Ky., U.S., on the Ohio river, opposite Cincinnati, served by the Chesapeake and Ohio railway.

The population was 8,943 in 1930 and 8,379 in 1940 by the federal census. There is some manufacturing, but the city is primarily a residential suburb of Cincinnati. It was settled and incorporated in 1849.

DAYTON, a city of southwestern Ohio, U.S., on the Great Miami river, 55 mi. NNE of Cincinnati, a port of entry, the county seat of Montgomery county, and a leading centre of aviation research.

It is served by the Baltimore and Ohio, the Big Four, the Erie and the Pennsylvania railways, by a number of air lines and by numerous motorbus and motor truck lines operating over the hard surfaced roads which radiate in every direction.

There are three commercial and two government airports and numerous emergency landing fields. The population was 243,108 in 1930 and 210,718 in 1940 by the federal census. About 70% are natives of Ohio.

The city covers 24.24 sq mi. of level ground 740 ft above sea level in a wide river trough, where three rapid streams (Wolf creek Stillwater river and Mid river) flow into the Miami. It is completely protected (since 1921) from all danger from floods. Boulevards and streets are wide and in the residential districts are lined with trees. The dwellings are for the most part small private houses, each with its own garden. Many of the factories are surrounded by attractive grounds.

The public parks and playgrounds comprise 1,100 ac. (including 1.25 ac island in the Miami), and just south of the city there is a municipal country club (264 ac of natural forest) with golf courses and tennis courts. The elimination of grade crossings within the city and the construction of a boulevard on the bed of the abandoned Miami and Erie canal were begun in 1917. A comprehensive city plan was adopted in 1925.

Dayton adopted a commission manager form of government in 1914. The water supply comes from driven wells 50-100 ft deep. Natural gas is used. Electric current, steam generated, is provided by a super power system, and the local power and light company furnishes steam heat to a considerable part in the central part of the city. The city is one of the few happily successful municipal garbage reduction plants. Both the death rate and the cost of living are relatively low.

The manufactures are many and varied. Dayton has long been known as the home of the National Cash Register company. It has become the leading producer also of electric motors, water plants for home use, electric refrigeration equipment, fire engines, computing scales, water softeners, fire belts, automobile parts, aeroplane parts, golf clubs and ice cream cones, and it makes all the government stamped envelope. Precision in industries is predominant, in which labour is more important than manual, and skilled labour more important than unskilled. The percentage of women in industry is relatively low, and there is little child labour. Except in the building trades the "open shop" prevails. The making of aeroplanes at Dayton began with the experiments of Orville and Wilbur Wright (qqv) who in 1903 flew successfully the first heavier than air machine.

During World War I the U.S. government located its aviation experiment laboratories at McCook field, on the northern boundary of the city. When this became too small, the people of Dayton raised \$400,000 in four days to buy a tract of 5,000 ac. northeast of the city (including the Wrights' original flying field), which they presented to the war department, to be a permanent home for the experimental and research division of the air corps. The city was again a centre of military aircraft research during World War II.

The annual volume of Dayton's wholesale business is estimated at \$552,000,000, its retail trade at \$538,000,000. In 1949 bank deposits amounted to \$2,658,873,307, post office receipts were \$6,474,733, and the assessed valuation of property was \$439,447,740.

The city has 83 public schools, including a normal college, and 20 parochial schools, 202 churches, and 3 daily newspapers, one of which is in German. It is the seat of the University of Dayton, a Roman Catholic institution founded in 1850 (formerly St. Mary college), Bonchbrake Theological seminary (United Brethren), and Sinclair college, also the Dayton Art institute (established 1919).

The Engineers' club and the Foremen's club are distinctive organizations. The National Association of Foremen was founded in Dayton and its official organ is published there. The first house built in Dayton, a log cabin on the bank of the Miami, is preserved as a historic museum. There is a state hospital for the insane and a large Veterans' Administration facility which was the first soldiers' home established in America (1867).

History—The site of Dayton was bought in 1795 from John Clevins Symmes by a party of Revolutionary soldiers. It was laid out as a town in 1796 by Israel Ludlow, one of the owners and named after Jonathan Dayton (1760-1824), who had fought in the Revolution and was at the time a representative of New Jersey in congress. In 1803 it was made the county seat and in 1805 the town was incorporated. Growth was rapid after the opening

of the Miami and Erie canal in 1828, and in 1841 it was chartered as a city. By 1860 the population had reached 20,081, increasing to 38,678 in 1880, 53,333 in 1900 and 116,577 in 1910. In March 1913, the Miami valley was swept for five days by a steady fall of rain resulting in a great flood. Over 400 lives were lost in the valley and damage to property is estimated at \$100,000,000. When the waters receded, Dayton was left covered with mud and debris. A pestilence was averted only by prompt and energetic measures. Mortal law was deferred, food was distributed and tents were put up for the homeless. A relief fund of \$750,000 was disbursed by the American Red Cross and the Citizens' Relief committee. Steps were taken to prevent the recurrence of such a disaster. On June 25, 1915 the Miami conservation district, a political subdivision of the state, was established under a new law, for the purpose of building and maintaining flood control works in the Miami valley. The plan finally adopted combined channel improvement with the construction of five great retarding basins. Five dams (from 1,000 to 6,400 ft long from 75 to 125 ft high, and from 50 to 755 ft thick at the base) were built across the upper valleys of the Miami and four of its tributaries. Construction work began in 1918 and was completed in 1922. The cost was \$32,000,000. Protection has been provided against a flood 40% greater than that of 1913 and 20% greater than the maximum estimated to be possible. Following the flood Dayton adopted a commission manager form of government which came into effect on Jan. 1, 1914. It was the first large city to install a manager and there has been no disposition to return to the mayorality system.

For an account of the flood of 1913 and the construction of the flood control works see *Technical Reports* (10 vols.) by various authors, published by the Miami conservancy district, Dayton, O.

DAYTON, a city of south-west Tennessee, U.S.A., 48 mi N.W. of Chattanooga, at the foot of the Cumberland escarpment, the county seat of Rhea county. It is served by the Southern railway. The population in 1950 was 3,191. In July 1925 the little country town was the scene of the famous "anti-evolution" trial, in which John T. Scopes, a teacher of science in the high school, was found guilty of having violated a state law prohibiting the teaching in the schools supported by the state of any theories, to the effect "that man is descended from the lower animals." Counsel for the defense included Clarence Darrow and Dudley Field Malone. The prosecution had the support of William Jennings Bryan, who died in Dayton a few days after the close of the trial. Scopes was fined \$100, but the penalty was set aside by the state supreme court on a technicality, without any expression of opinion as to the constitutionality of the law. William Jennings Bryan, in university, on a hill overlooking the town, was founded by Bryan's admirers as a memorial to him.

DAYTONA BEACH, a city of Volusia county, Fla., U.S.A. on the Halifax river, 50 mi below St. Augustine, on federal highway 1 and 92 and state highway 140, and served by the Florida East Coast railway, air lines and buses. It was formed in 1925 by the consolidation of the city of Daytona and the towns of Daytona Beach and Seabreeze, its total population in 1950 was 29,254. Daytona Beach is a popular winter resort, with many hotels and private winter homes and a summer season attracting 2,500,000 visitors. The Spanish style of architecture prevails, and the assessed valuation of property in 1950 was \$61,848,430. Along the third, white beach which adjoins that of Ormond, is a fine automobile racing course, where many speed records have been made.

DEACON, a minister or officer of the Christian Church. The status and functions of the office have varied in different ages and churches, and the name is the Gr. *διακονος*, minister, servant.

(a) **The Ancient Church**—The office of deacon is almost as old as Christianity itself. Tradition connects its origin with the appointment of the Seven recorded in Acts 6:1-6. This connection, however, is questioned on the ground that "the Seven" are not called deacons in the New Testament and do not seem to have been identified with them till the time of Irenaeus (c. 180). The officers of the church are described in Philippi 1:1 as "bishops and deacons", and in 1 Tim. 3:8-13 the office of

deacon has evidently become a permanent institution of the Church. By the time of Ignatius (c. 110) the "three orders" of the ministry were definitely established, the deacon being the lowest and subordinate to the bishop and the presbyters. In the apostolic age the duties of deacons were naturally vague and undefined, with the growth of the episcopate, however, they became the immediate ministers of the bishop. Their duties included the management of Church property and finances, distribution of alms and care of the sick and of widows and orphans. They were also required to seek out and reprove offenders (*Apostolical Constitutions*, 4th cent.) With the growth of hospitals and other charitable institutions, however, the social work of the Church was transferred to others, and the diaconate came by degrees to be regarded (as in the Roman Catholic and Anglican Churches to-day) merely as a step towards the priesthood, and the deacon's duties were practically restricted to ritual acts, such as reading the Gospel, anointing the priest, etc., at High Mass.

(b) **The Church of England**—The diaconate is recognized as one of the "three orders," and is conferred by episcopal ordination. Candidates must be 23 years old and must satisfy the bishop as to their intellectual, moral and spiritual fitness. Deacons may perform any sacred office except that of consecrating the elements and pronouncing absolution.

(c) **Churches of the Congregational Order**—In these (which include Baptists) the deacons are laymen appointed by the members of the Church to superintend the financial affairs of the Church, to cooperate with the minister in the various branches of his work, assist in the visitation of the sick, attend to the Church property and generally supervise its activities.

See Thomas, *Lines et nova disciplina pars I*, lib. I c. 5 f. and lib. II c. 23 f. (Lundinum, 1796); J. N. Soud, *Die Diakonen in der katholischen Kirche* (Regensburg, 1884); R. Sohm, *Kirchenrecht*, I, 111-137 (Leipzig, 1892); F. J. A. Hort, *The Christian Ecclesia* (London, 1897).

DEACONESS, a woman set apart for special service in the Christian Church. The origin and early history of the office are obscure. The arguments for its existence in apostolic times, based on Rom. xvi. 1 (where Phoebe is called *diakonos*) and 1 Tim. ii. 11, and on Pliny's mention of two *caeciliae* *que ministras decessant*, are hardly conclusive. But it is certain that before the middle of the 4th century there existed in the Eastern Church an order of deaconesses, of higher rank than the somewhat similar orders of "virgins" and "nuns." The order is recognized in the canons of the councils of Nicea (325) and Chalcedon (451), and many of Chrysostom's letters are addressed to deaconesses at Constantinople. The ordination of deaconesses resembled that of deacons, but conveyed no sacerdotal powers or authority (for specimens of the ordination service see Cecilia Robinson, *The Ministry of Deaconesses*, 2nd ed., 1914, pp. 219-229). Their mission was to perform certain offices in connection with the care of women. The functions of the deaconess, according to the apostolical Constitutions, were as follows: (1) To assist at the baptism of women, (2) to visit and minister to the needs of sick and afflicted women, (3) to act as door keepers in the church, and conduct the women to their seats. In the Western church an attempt seems to have been made in the 4th century to introduce the order into Gaul. The movement, however, was strongly opposed, and was condemned by the councils of Orange (441) and Epone (517). Despite the prohibition the institution made some headway, and traces of it are found later in Italy, but it never became popular in the West. In the middle ages the order fell into abeyance in both East and West.

In modern times several attempts have been made to revive the order. In 1833 Pastor Fledner founded "an order of deaconesses for the Rhenish provinces of Westphalia" at Kaserwerth. The original aim of the institution was to train nurses for hospital work, but afterwards it trained its members for teaching and parish work as well. Kaserwerth became the parent of many similar institutions. The revival of the order in the Church of England dates from 1862, when Miss Elizabeth Ferard was set apart by the Bishop of London. Other dioceses gradually adopted the innovation. It has been sanctioned by Convocation, and the Lambeth Conference in 1897 "recognized with thankfulness the revival of

the office of deaconess," but insisted that the name must be restricted to women set apart by the bishop and working under the control of the parochial clergy.

In addition to Miss Robinson's book cited above, see *Church Quarterly Review*, xlvii, 352 ff., art. "On the Early History and Modern Revival of Deaconesses" (London, 1895), and the works there referred to: D. Latas, *Χριστιανική Διακονία* 1, 163-171 (Athens, 1883); *Testamentum Domini*, ed. Rahmani (Maine, 1899); L. Zschirneck, *Der Dienst der Frau in den ersten Jahrhunderten der Kirche* (1902).

DEAD, DISPOSAL OF THE Monuments and buildings set up by man for the use of the living were seldom preserved by him beyond their period of usefulness and seldom remain intact, but his arrangements for the dead were usually made with permanency in view and are frequently discovered undisturbed. From these records of the past knowledge is yielded of man's physical characteristics, circumstances, material achievements, customs and beliefs. Inscriptions are rarely present to give a date to graves, but the method of disposal, the type of grave, the objects deposited with the dead, their relative positions, the posture and orientation of the body, and, in the older periods, the geological stratification and contemporary fauna, provide knowledge of the period and race to which the remains may be assigned.

PALAEOLITHIC PERIOD

The earliest human remains as yet discovered—at Trimi (*pitheanthropus*), Heidelberg and Pittdown—were river borne fragments, whether originally buried is unknown, but the earlier part of the last ice age supplies in several instances evidence of the disposal of its dead by the Neanderthal race in Europe. Thus the bodies of the La Ferrassie man and child were protected by stones, a pillow of flint chippings was gathered together for the Le Mouster youth, and graves were dug for the La Chapelle man and La Ferrassie infant. Belief that the dead lived on and had the same needs as the living is shown in the stone implements placed with the Le Mouster, Spy I, and La Chapelle burials, and in the ochre and food supplied for La Chapelle, and in each case the home of the dead is, as in life, the rock shelter or cave.

Finds from the Upper Palaeolithic period are more numerous, and here again almost all burials are in caves or by rock-shelters, including probably the remarkable oval grave fenced round with mammoth shoulder blades at Předmost (Moravia) this enclosed 20 burials in squatting position, and was dug in loess close to a limestone outcrop which once probably formed a rock shelter. The chief exception is the richly furnished single burial in level ground at Brunn. The same kind of provision continues to be made for the dead during this epoch, but its developed culture provides finer implements and a wealth of personal ornaments: necklaces, armlets, anklets, aprons, caps, of threaded shells and animals' teeth, carved bone amulets, ivory figurines. Instead of the small lumps of red ochre at La Chapelle, many of these later graves are liberally strewn with the substance. The cave-hearth is now frequently chosen as burial site (Solutre, Grimaldi), and here occasional charred bones are more probably due to incompletely extinguished fires than to deliberate cremation.

Though no invariable position characterizes palaeolithic burials, an attitude of sleep—knees bent, arm under head—is the most frequent in Europe, while in Africa contracted posture obtained in the palaeolithic cave-burials discovered in 1927 near Lake Nakuru (Kenya), and with the skeleton of the same type and period from Oldoway (1913) further north. In Lower Palaeolithic burials at La Ferrassie and an Upper Palaeolithic at Grimaldi, however, were skeletons whose sharply-bent knees and arms were pressed close against the chest. So lie the dead of many primitive peoples bound tightly lest they walk, or use their hands for mischief on the living.

Already in Upper Palaeolithic Spain and France there are some indications of a cult of the skull in calvaria prepared as "bowls," and in occasional burial of the head alone. But with its closing phase (Azilian) comes the remarkable cave-burial at Onfret (Bavaria) where the severed heads of the dead were deposited one by one into two scooped out "nests," six into one, 27 into the other. They were rich ornaments of shells and stag's teeth, were ceremonially besprinkled with red ochre, and all faced west. Charcoal

and charred remains near by suggested that the bodies were cremated. From the same period date the human bones in M¹is d'Azi (France), scraped clean of flesh and painted red before interment.

POST PALAEO LITHIC

As mankind passes through stages marked by his discoveries of the crafts of stone polishing, copper, bronze and iron working, we find an immense variety of funerary custom, conditioned partly by natural and cultural resources, largely by belief as to the kind of life after death, and the relationship between dead and living

Cremation and Inhumation—In Europe total cremation is found associated with the Late Neolithic decorated pottery and painted pottery cultures, from Belgium to southern Russia. Inhumation was general over Europe in the earlier part of the bronze age, but gradually in the later part it was largely replaced by cremation, and from then on the two methods competed and alternated in different countries until the spread of Christianity banished cremation from European civilization down to its modern revival. This practice has a long and varied history in other continents also. A mid-fourth millennium cemetery rich in gold and copper objects was discovered at Ur (Mesopotamia) in 1927, and contained partial cremations which argued total cremations at an earlier epoch, by the end of that millennium inhumation prevailed alone at Ur. Cremation has been the usual Hindu method, frequent also among Buddhists, rare in China. It was general among the Aztecs of Mexico, reserved only for people of rank in the Maya civilization of Yucatan, and for occasional criminals among the Jews. In Egypt it is unknown.

Other Methods—These include (1) the preservation of the body by smoke-drying, embalming, etc. (see MUMMIFY), (2) exposure to birds of prey (as by the incant Scythians, the Zoroastrians, the poorer Samsees), river committal, or other methods little likely to help in identifying the remains, (3) disposal in two stages—first, of the corpse by burial, exposure, etc., until the soft tissues disappear, second, of the bones either individually as in eastern South America (in jars), or collectively, as in the case of the Bush barrows, in the great neolithic hypogeum at Hal Saflieni (Malta), or in vaults of mediaeval English churches such as Hythe.

Posture and Orientation—In many cultures and religions a definite position is given to the dead. The posture usually ranges from tightly contracted to fully extended, the former tending to be associated with more primitive, the latter with higher civilizations, the body usually lies on side or back, or is seated, and is frequently orientated in a given direction. Thus in Egypt the tightly contracted pre-dynastic posture gradually loosens as the dynasties pass until full extension is reached in the Middle Kingdom. From the Old Kingdom onwards the body usually lies with head north, face to the sunrise. In England bodies lay contracted till shortly before our era, but orientation varied until Christianity taught that the feet of the dead should be towards the east, whither they must hasten at the last trump. The custom mainly holds in England still, but Norway and Holland have long abandoned it, except in country districts. Buddhist tradition—where Buddhists bury—dictates head north, face upward, as Buddha died. The Mohammedan must lie on his right side, facing Mecca, but the Japanese in his tub-shaped coffin sits upright, like some among our ancestors in chambered barrows.

Tomb furniture—Burials bare of all else but (originally) a garment or shroud are not infrequent, and broken sometimes poverty, sometimes high beliefs: strict Jews must bury thus. R. further protection is usually afforded. The pre-dynastic Egyptian and early Sumerian were often wrapped in matting, though pan-shaped and bucket-shaped pottery coffins were already in use. Slipper-shaped pottery coffins were common among the Chorote gens (Nicaragua) and Parthians, large jars, in Greece at the end of the 2d millennium, in prehistoric southern India, in the Americas. Worker work, wood, stone, marble—all have played their part in confining the dead. As to possessions: sometimes the latter have none, sometimes a sophisticated civilization cheats them with useless imitations, but mostly the objects are real, valued in life and retained in death.

Type of Tomb—The use of caves as sepulchres continued in the Neolithic period—usually is sepulchres alone, and in the Late Neolithic were excavated the first artificial burial-caves. In Mediterranean lands the single "cave" entered direct from cliff face then added an entrance passage, as the trench in level ground gained a side chamber, then both gradually developed extra chambers and niches. These elaborations culminated in a catacombs such as those of Panticapaeum (Crimea)—and most elaborate of all—of Rome. Megalithic tomb architecture sprang up in Neolithic flowered and died in Bronze (see CARNAC *Megalithic Monuments*). In Neolithic times the first burrows also were piled up as burial places and memorials. But as mankind elaborated—plays out—these various ideas concerned in his imaginative idiosyncrasy, he reverts ever and again to the simple grave as standard, while, throughout, we find the simple grave persists for simple folk.

BIBLIOGRAPHY.—Hastings *LRI* 57 "Death and Disposal of the Dead (1911); M. Ebert, *Kultur der Vorgeschichte* (1924); C. E. Vulhamy *Immortal Man* (1936). (M. L. T.)

In the early times of Niderlathim in the bodies of the dead were buried with some ceremony and, with the apparent exception of one or two very primitive tribes, there is no known people to day which does not dispose of its dead in some well defined, traditional manner. The treatment of the corpse, however, is not as a rite complete in itself, it is but an incident in a series of rites. When a community loses one of its members, especially anyone of importance, it suffers a shock, and the rites connected with the dead are to be regarded as the stereotyped behaviour of society by which it adjusts itself during such a period of strain and emotional disintegration. For this reason their correct performance is important to society. The more serious the loss that is, the greater the value of the deceased to the community, the more elaborate will these rites be and the greater the number of people which they concern. The very aged, on the other hand, and those who have long been ill and who, therefore, have for some time taken little part in the life of the community, often receive scant attention at death and may even be buried alive, since, socially, they are in a sense already dead.

There are many variations in the ceremonies connected with death, and in the treatment of the corpse, but each has its recognized procedure from which deviations are rare, and in all there seem to be three distinct phases. The first lasts from the time of death, or when all hope of the sick person's recovery is abandoned, until the beginning of the rites directly connected with the disposal of the body, the second is during the performance of these rites, the third is covered by the period from the disposal of the body till the cessation of mourning.

When the individual is dead, or regarded as dead, the corpse is usually washed and decorated and a ceremony of leave-taking may be gone through, often accompanied by the presentation of gifts. The duration of this period varies considerably according to the importance of the deceased or to the affection felt for him. For a commoner a day or two may suffice but for a chief it may occupy many weeks and the body is sometimes partially embalmed to prevent decomposition from setting in during this time. If it is suspected that death was due to foul play, especially sorcery, omens are now carefully observed or the body is asked to indicate in some recognized manner the guilty person or persons. Friends and relatives having now said farewell, the body is laid to rest.

The number of ways in which a body can be disposed, are six: inhumation or burial, cremation, preservation, exposure, water-burial and hastening decomposition by artificial means. Occasionally the bodies are exposed for destruction by wild animals. Many or all of these methods are sometimes found in use among a single people. Where this is so, the mode of disposal of the body is usually determined by his social status, by membership of some social group, his achievements in life or the cause of his death. In general, such methods as preservation and the artificial hastening of decomposition are reserved mainly for those who have been important in life. Those who are unimportant to society are usually given a form of disposal which entails little trouble or expense. The cause of a person's death often affects profoundly the fate both of the body and soul. A person who has died by

falling from a tree, or by violence in peace or war, is usually treated differently from his fellows, and special treatment is at most always allotted to suicides and women who have died in childbirth. The reasons for such distinctions are not always clear but, in general, these unfortunates are considered to be undesirable. Those who are earth-bound are usually feared and measures are taken to prevent their souls from troubling the living, such as putting thorns into the feet of the corpse so that the spirit may not walk, placing stones or briars over the grave that it may not escape thence, or burning the body and so destroying the soul.

Inhumation—Where inhumation is practised there is often a cemetery, usually situated at a little distance from the village, where all of that community are buried, or there may be separate ones for the different kindreds which compose it, occasionally one is reserved for men, and another for women. These are often carefully tended and are sometimes used for the meetings of the village council. Frequently, however, cemeteries are absent and the site of a man's grave is either fixed by tradition, as, for instance, in his garden or before the threshold of his house, or selected by himself or his heirs. The most usual form of grave is a trench, sometimes shallow, occasionally of considerable depth, but some are more elaborate. A common form is a pit at the bottom of which a horizontal recess is excavated and in this the corpse is laid the pit being usually but not always filled in afterwards. In some areas the grave is an underground chamber approached by a subterranean passage. To prevent the soil touching the corpse the sides of the grave are sometimes lined with wood, stone, leaves or mats, or the body itself is carefully wrapped up. Wooden coffins are used by some tribes, or, among sea-faring peoples, the deceased is buried in his canoe. The superstructure of the grave may be only a low hummock of earth, but, over the remains of important people, large mounds are often erected. A small hut is often set up over or beside the grave, to protect the soul (which usually lingers near the body until decomposition is complete) from the inclemencies of the weather. Grave-stones are also erected as memorials and as temporary abodes for the spirits when they desire to visit the living.

Cremation—The destruction of the corpse by fire has a world-wide distribution. Often it is restricted to a certain class of people, notably chiefs, but sometimes, where other methods are normal, it is used for lunatics, workers of black magic and other dangerous members of society. When such people are burnt the remains are generally thrown away. In other cases they are buried, cast ceremonially into water or placed in ossuaries belonging to a kindred or village group. Sometimes some member of the deceased's family keeps them, or certain of them, and treasures them as a link with the soul of the departed. The construction of the pyre and the kind of timber used are generally decreed by custom, since any deviation brings misfortune on the soul of the deceased.

Preservation—The practice of preserving the bodies of the dead is not restricted to ancient Egypt. It is found to day among tribes scattered throughout the world and even among such primitive ones as those of Torres Straits. Generally it is reserved for chiefs or priests. The methods used vary considerably. Preservatives, such as alcohol, honey, salt, butter or the shavings of certain woods are common, sometimes the body is dried by smoking, usually preceded by eviceration or massage to extract the juices, and sometimes it is placed in a sealed wooden effigy or coffin. In one tribe in East Africa, a fire is lit on the top of the grave with the intention of baking the body.

Exposure—More common than preservation is the custom of exposing the dead on trees, rocks or on platforms erected in the gardens or the bush. Where the atmosphere is hot and dry this may result in desiccation which possibly is intended. Elsewhere the corpse is left to decompose and the bones are collected and kept as relics or placed in an ossuary. During the period of decomposition the living often visit the body and sometimes rub themselves with its juices probably in order to link themselves more closely to the deceased or to absorb his virtues. Exposure may, in some places, be closely allied to burial, for where there is

not sufficient depth of soil to dig a grave (as in islands of coralline and volcanic formation), the obvious alternative is to lay the body on the ground.

Artificial Decomposition—Artificial means to hasten decomposition are often reserved for important men. It is sometimes effected by warming the body over a slow fire or by washing it regularly and scraping away the putrifying flesh. If only a portion of the body is to be cleaned, such as the head, which is treasured by many who have an ancestor cult, this may be wrenched off and placed in a 'termite's' nest to be eaten clean, while the rest of the body is disposed elsewhere.

Water Burial—To fling a corpse into the water is an easy mode of disposal and is, therefore, often the fate of slaves, for eigners or people of no account. But there are tribes among whom it is not considered an undistinguished end, and some individuals may even request to be buried at sea, because they "like wash all time 'long salt water'." Certain parts of the coast are in some islands set aside as water cemeteries where, after being wrapped up to protect them from the fish, and weighted to prevent them from being washed on shore, the bodies are sunk. In the Solomon Islands, however, where sharks are regarded with veneration, the dead are laid on the reef for these creatures to complete the burial. A method (not strictly "water burial") is that of placing the deceased in a canoe and pushing it out to sea. This was formerly practised in many parts of Polynesia, and is recorded from the Cameroons, where the coastal inhabitants set the figure of a bird on the prow of a funeral canoe to guide it on its way because those for whom it is done are descendants of an immigrant people who, at death, must return across the sea to the land of their origin. This may also explain the other forms of sea burial and likewise the use of a canoe as a coffin, certainly the latter is sometimes definitely connected with an after world which must be reached by boat.

Orientation—Wherever inhumation, cremation or exposure are the custom, the position in which the body is placed and the orientation in the grave or on pyre or platform, are important. Even so insignificant a point as whether the body is laid on its right or left side may affect the fate of the soul in the land of the dead. The corpse may lie extended on its back or front, or be seated upright or recline with flexed knees. Sometimes if buried on land or in the sea it may be fixed as though standing, the erect position in the water being obtained by weighting the feet. A very common position for burial is lying on one side with knees drawn up and the hands raised to the face as in sleep, though it has also been suggested that this is in imitation of an infant before birth.

Often there is no definite orientation. Even in one cemetery the bodies may be facing in many different directions. But it is frequently the custom for the head to point or the face to look towards that point of the compass where lies the other world or the land whence the people have migrated.

Secondary Disposal—The disposal of the remains after cremation and exposure is a necessary part of the funeral rites. But even where inhumation is practised the bones are sometimes exhumed and laid in a special spot, often as a regular part of the ritual which may take place at a definite time after the burial or on a great annual ceremony when the bones of all who have died within the year are finally laid to rest. Among people who have a cult of the dead the skull is often kept by the living to be an abode for the soul if it wishes to visit this world. Other bones are also sometimes kept, not as shrines, but for use in magical ceremonies or for the making of weapons. This secondary disposal often marks the close of the period of mourning and may be for the deceased the last act in the *passage rite* (see *PASSAGE RITES*), as a ceremony whereby the soul is finally despatched to the other world of which community it is henceforth a full member. Some times, however, exhumation and secondary disposal are only performed under exceptional circumstances. If a soul troubles the living, the body may be dug up and either removed elsewhere or destroyed by fire or water. Often the soul itself indicates that it desires such a removal, and it may demand several changes of abode before it finds one to its liking. It expresses its wishes

either to a relative in dreams, or by curing sickness and misfortune.

Grave goods.—To the savage the dead closely resemble the living in both psychological and physical make-up. It often seems that at death the soul is conceived as being weak, just as its body was. To give it increased vitality the mourners cut themselves and allow the blood to drip on to the corpse for blood is the spirit of life. The laying of food on the grave and the lighting of fires are plainly the result of this material conception of the soul, but the reasons given for the practice vary. Sometimes the journey to the other world is long and the food is for the support of the traveller on his way. In other places it is intended for the comfort of the disembodied creature during the time that it hangs about its home before departing to join its ancestors. The grave goods destroyed or buried with the body are definitely for use in the land of the dead, which in physical and social formation is very like that of the living. In it a man will need those things which were valuable in life—weapons, tools, wealth. They are therefore buried or burnt with him, if buried they are often broken in order that their non-material essence may be released. Pots have been found specially made as grave goods, with holes in the bottom or with uncompleted designs, though which this spiritual part can escape. The killing of a man's favourite wife or slaves is a further logical result of this conception of life after death, for he will continue to need them to minister to his wants. To avoid the actual destruction of the property cheap imitations may be buried or burnt as in China to day, or the objects may be laid on the corpse while it lies in state and removed before disposal. In this way the dead man retains the use of them in the other world and his heirs have the use of them in this.

DEAD RECKONING, the computation of a ship's position derived from the latitude and longitude last determined, from the direction of the compass and rate and time of sailing according to the log reference also being made to astronomical observation for correction and comparison of this method. See NAVIGATION, and AERIAL NAVIGATION.

DEAD RENT The fixed rent payable under the leases of mines or quarries and paid in addition to the stipulated royalties. This payment secures to the owner of the mineral a certain income, and ensures that the mine or quarry is worked in his interest, since if the property lies idle the dead rent must be paid. (See RENT.)

DEAD SEA, the lake in southern Palestine in which the river Jordan terminates. It is bounded on the north by the Jordan valley—at that point broad and forbidding, on the east by the escarpment of the Moabite plateau, on the south by the desert of the Arabah, and on the west by the mountains of Judaea. It has a length of 47 m. and a breadth of 10 m., a superficial area of 360 sq m. and a mean depth of 1,080 feet. Its surface level, which has a seasonal variation of 10 to 15 ft., lies about 1,300 ft. below that of the Mediterranean, and is the lowest sheet of water on the earth's crust. The Jordan alone pours into the Dead sea on a daily average a volume of water estimated at 6 million tons, and in the winter season torrents—very few of which are perennial—from the hills to the east and west add their contribution. The rainfall in the Dead sea valley seldom exceeds 5 in. in the year. There is, of course, no effluent. The heavy inflow is carried off by evaporation (estimated at 13½ mm. per day), visible in stange looking blue-white clouds which float half formed and ethereal above the waters. An interesting feature is the peninsula, called from its shape the *Lisan* (tongue) which projects from the east shore. The sea to the south of this peninsula is shallow, showing a depth of from 3 to 30 ft., whilst north of it, towards the eastern shore, is the point of greatest depth

(1,310 feet).

Geology.—The Dead sea occupies the lowest point of the Jordan rift valley or trough fault, caused by the slipping down of the strip of earth's crust confined by the two parallel fractures visible in the rock walls on either side of the valley. In the Jurassic and Cretaceous periods an extended Mediterranean covered Syria and Palestine but during the Tertiary period an extensive upheaval of the sea bed produced land. The earth movement was uneven, creating wrinkles (the Lebanon and the hills of western Palestine) and causing the fractures which resulted in the Jordan Dead sea depression. There seems reason to suppose that prior to the Pliocene period, which later followed the climate of this region was similar to that now prevailing, and that the Dead sea was approximately the same size as at present. During the Pliocene period the surface of the Dead sea gradually rose until it reached a height of 1,400 ft. above present level, and consequently higher than the Mediterranean. At this stage it was a vast inland sea stretching 200 m. from Huleh in the north to a point 40 m. beyond its present southern limit. Its waters were capable of supporting life, and remains of its fauna have been found in its marginal deposits.

A dry period supervened during which evaporation prevailed over precipitation causing a gradual shrinkage, until after a long interval only a remnant of the great sea remained, leaving in its wake deposits of marl, gypsum and salt and clearly defined beaches to bear silent witness to the uneven course of desiccation. The formation of the Lisan and of Jebel Usdum, a hill on the south west shore, must have occurred subsequent to this period of contraction, since both are composed entirely of these lacustrine deposits. The strata of the Lisan dip to the east showing that there has been an upheaval of the floor of the Ghor. It is permissible to conjecture that the crustal movements, due probably to continued faulting, which forced up the Lisan and Jebel Usdum, forming a southern escarpment of varying elevation and irregular base line, depressed at the same time the sea-bed to the north of the Lisan, where its deepest part is known to be. With the sea confined to the north of this barrier, what is now the shallow end of the Dead sea would be dry land. At no very distant date the sea broke this barrier at its western side, aided, it may be, by another tremor, or by merely overflowing, as its level rose, at a point where the barrier was low. That the level of the Dead sea is now rising, and has seemingly been rising for centuries, is well established. Since Kitchener's survey in 1883–84 it has risen nearly 20 feet. Since 1900 it has not risen more than 6 to 8 ft., however. The chief contributing factors to this rise of level are the encroachment on the sea of the Jordan delta, the gradual raising of the sea bed through fresh layers of precipitate and climate that seems to be growing more moist.

Salinity.—The water of the Dead sea is intensely saline. Whilst ocean water has a salinity of 4–6%, Dead sea water contains 23–25% of salts. Exhaustive analyses of water taken from different parts and at different depths have been made. The following selection from the analyses made by Terrell will suffice. A is surface water at the north end, B 120 metres deep 5 m. E of Käs el-Feshkha, C 300 metres deep at the same point. T = Trace.

	A	B	C
Chlorine	65.81	67.66	67.30
Bromine	2.37	1.98	2.72
Sulphate	0.31	0.22	0.24
Carbonate	T	T	T
Sodium	11.65	10.20	5.50
Potassium	1.85	1.60	1.68
Calcium	4.73	1.51	6.64
Magnesium	13.20	16.80	15.99
Silica	T	T	T
Total solids in grams for 100 grams of liquid	100.00	100.00	100.00
	19.2	24.5	25.9

Magnesium, sodium, calcium and potassium are present as chlorides. The chloride of magnesium, largely held in solution,

gives the water its nauseous taste, and chloride of calcium its smooth, oily feeling. The brine, as can be seen, is a commodity of great economic and commercial value, and applications have recently (1926) been invited by the Government of Palestine for the monopoly right for developing the mineral resources of the Dead Sea. The density of the water is roughly 1.160, increasing from north to south and with the depth. At the southern end the density is 1.253. In consequence the water in the Dead Sea finds that when the water reaches his armpits he is swept off his feet, and in swimming the shoulders are all the time out of the water. When the water is permitted to dry on hands or clothing the resulting stickiness is distinctly disagreeable. No animal life can exist in its waters. Fish brought down by the Jordan die and furnish food for the sea birds. From the salt pools on the north shore and from the Jebel Usdum the Badouin have been in the habit of retrieving salt to smuggle. Salt was a Government monopoly under the Turks and continues to be so under the new Palestine regime.

Recent investigation has shown that the river Jordan carries an unusually high percentage of salts, especially sodium chloride and magnesium chloride. In the Dead Sea the sodium chloride crystallizes out, but the magnesium chloride remains in solution. With magnesium as a permanent and increasing element in Dead Sea water, its rate of entry and the cubical content of the sea calculable, the age of the Dead Sea becomes a matter of simple arithmetic. From the data available to him Irwin puts the figure at 50,000 years—obviously much too low.

Bitumen, or more exactly, asphalt, floats ashore on occasion. It is collected and used as a protection against worms and grubs in vineyards. According to Arab writers, it had many medicinal virtues. Search is now being made for petroleum in the Dead Sea area.

History.—No other sea has had such a variety of names. The term "dead sea" was first introduced by late Greek writers, and is used by Pausanias, Galen, Justin and Eusebius. To the Hebrews it was "the sea," "the salt sea," "the sea of the Arabah," "the eastern sea." To Josephus it was "the asphalt sea," "the Sodomish sea," whilst to Arab writers it was "the sea of Zarah (Zoar)," "the stinking sea," "the sea of overwhelming," "the dead sea" and "the sea of Lot." This last is its modern designation. Historically, interest in the Dead Sea centres in the biblical narratives of Abraham and Lot, and the destruction of Sodom and Gomorrah. At En Gedi, on its western shore, David took refuge. To the south of En Gedi lies the fortress of Massada (*Sebbakh*), built by Jonathan Maccabeus, the refuge of Herod and Mariamne when the Parthians took Jerusalem (42 B.C.), and the scene of the last stand and self-destruction of Eleazar and his devoted band of zealots after the fall of Jerusalem (A.D. 70)—this last a grim tale of Roman determination and Jewish heroism.

In early times the sea was navigated, as Tacitus and Josephus bear witness, and under the crusaders the new navigation dues formed part of the revenues of the lords of Kerak. The Turkish sultans of more recent times regarded the sea as their private possession, and sold to individuals the exclusive right of putting boats on it. The Turks, with German assistance, put a flotilla of motor boats on the sea during the World War, and in 1922 one steamer, three motor boats and 14 sailing vessels were plying on its waters.

The tradition that the Dead Sea covers Sodom and Gomorrah dates from Josephus. The site of the overwhelmed cities, whether under the waters of the sea at its north end, or its south end, or on its eastern or western shores, continues to occupy the minds and excite the ingenuity of investigators. Although the question is not fully resolved—if, indeed, it ever can be—the evidence almost certainly dry land within historic times. That in this bituminous region a violent earth tremor—to which, indeed, the Ghor and its borders are peculiarly liable—should have brought into play eruptive forces whose catastrophic effects are indicated in the Bible narrative, is more than probable. The recent (1924) joint expedition of the Xena seminary and the American School of Oriental Research sent out to locate the Cities of the Plain

were convinced that three of them, Sodom, Gomorrah and Zoar, stood in the south east corner of the Dead Sea, on the lower courses of the only perennial streams in that region, the Numeirah, the Esal and the Kurahil respectively, but now of course beneath the sea. Kyle and Albright would assign but one town to each watercourse, and think that Admah and Zebaim must be sought elsewhere. Yet if they would but think of these perennial streams meandering over the plain to meet the sea west of the Lisan, the vision pictured is of an oasis like Damascus, a veritable "garden of the Lord," where there would be room for Admah and Zebaim and, indeed, many others.

The dismal associations of its name are not borne out by the sea itself. The wild tales of mediaeval travellers that in its poisonous air no plant could live, that over its dread waters no bird could fly and that no waves ever disturbed its gloomy surface, are figments of the imagination. The doom of Sodom and Gomorrah must needs be writ large on the waters that hid them. "To think of this lake as sombre is quite an illusion, its intense colouring, its varied effects of light, its scarped overhanging slopes, broken by deep gorges, produce a picture of wild and sublime beauty." Its winter climate, with a temperature of 75° F. by day and 60 to 65° by night, is probably the finest in the world. The possibility of the development of some oases on its south-east shore as winter resorts has been suggested. Here is the testimony of the Xena seminary expedition, which spent part of the winter there in 1924: "With proper irrigation three large oases, totaling perhaps 10,000 ac., could be made into a veritable tropical garden. The atmosphere was pure and refreshing and there was as little swamp smell as may be found anywhere along the shores of salt water. The scenery is beautiful, sublime and romantic far beyond that of many of the winter resorts of the world. Under proper irrigation, with the establishment of a motor boat and automobile line to Jericho and Jerusalem, this plan may soon vie with Luxor as a winter health resort."

The future of this, the most interesting of all seas, will be watched with interest whilst modern enterprise takes a hesitating step towards the fulfilment of Ezekiel's prophetic vision.

DEADWOOD, a city in the Black hills of western South Dakota, U.S., 2 mi. N.E. of Lead, the county seat of Lawrence county. It lies in a narrow canyon 4,530 ft. above the sea, on federal highways 14 and 85, and is served by the Burlington and the Chicago and North Western railways, air and bus lines. Pop. (1950) 3,270, (1940) 4,100. Deadwood is a headquarters for tourists, and the commercial centre of a cattle raising and gold-mining region. It has stamp mills, smelters and cyanide mills. In 1875 the discovery of gold in this region was made public. The United States bought the land from the Sioux and in 1877 opened it to settlement. Deadwood gulch was the centre of the rush that followed, and its colourful history is commemorated by pageants held in a natural amphitheatre rimmed by steep hills. Mount Moriah cemetery, on a high mountain overlooking Deadwood, contains the graves of "Wild Bill" Hickok, "Calamity Jane," "Preacher" Smith and "Potato Creek" Johnny. The Adams Memorial museum, free to the public, has one of the finest historical collections in the country. Ft. Meade is 10 mi. N.E. of Deadwood.

DEAF AND HARD OF HEARING, EDUCATION

OF The term "deaf" is frequently applied to those who are deficient in hearing in any degree, however slight as well as to people who are unable to detect the loudest sounds. In this article the term "deaf" is applied to those who are so handicapped they are unable to receive instruction through the sense of hearing. These are divided into two groups, the congenitally deaf—those who are born deaf—and the adventitiously deaf—those who were born with normal hearing, but in whom the sense of hearing is non-functional later through illness or accident. The hard of hearing are those in whom the sense of hearing, although defective, is functional with or without a hearing aid (D M L)

DEAFNESS IN CHILDREN

Children may be born deaf or may acquire deafness in early infancy. There is a serious interference with the normal course of mental and educational development when the deafness is so great as to prevent the hearing of the spoken word. It is through hearing that the normal child learns to appreciate the meaning of words and to gain a knowledge of his mother tongue. It is through hearing that the normal child obtains those sound patterns which guide his infant attempts at speech. The severely deaf infant who is unable to hear spoken language consequently fails to acquire a knowledge of words or language and does not develop the power of speech. Devoid of the common means of communication (*i.e.*, the knowledge of language and the ability to speak) such children are isolated from the rest of society and suffer a major handicap in education. Such children who are dumb through deafness produce that section of the community commonly, but often erroneously, known as the "deaf and dumb." They constitute a special class of handicapped children for whom special educational provisions are necessary. Dumbness divorced from deafness is a rare condition which is outside the scope of this article.

Classification—Where deafness is so severe that the child is unable to acquire a knowledge of language and the power to speak in the natural way, very special educational treatment is necessary, and such children are educated in special schools for the deaf. In other cases the degree of hearing loss may not prevent the acquisition of normal speech and language but yet constitute a serious handicap to normal educational progress. These children, known as "partially deaf," need also special educational treatment which is provided in special schools for the partially deaf or in special classes in schools for the deaf. The policy in the United Kingdom is to segregate the two classes since the basic educational problems are different. In the schools for the deaf the essential task is to teach by special methods a knowledge of language and speech.

In schools (or classes) for the partially deaf the main work is to carry on the normal process of education with the use of hearing aids and lip reading.

Where the degree of hearing loss is small, children may be trained in the use of individual hearing aids and taught to lip read, and their education successfully carried on in the normal schools. Such children are generally known as "hard of hearing." There are three recognized categories of deaf children as follows: Grade I, where the hearing loss constitutes no threat to normal education, Grade II, divided into two categories IIa (hard of hearing) and IIb (partially deaf), where the hearing loss has not prevented the natural acquisition of language and speech but where special assistance is necessary according to category as follows: in Grade IIa, by provision of hearing aids or lip reading instruction, or both, and education in the normal schools, in Grade IIb, by provision of hearing aids and education in special schools or classes for the partially deaf, Grade III, where the hearing loss is severe and prevents the natural acquisition of language and speech. For children in Groups IIb and III education is provided in special schools, and attendance is compulsory.

Causes of Deafness—There are two main types of deafness, conduction deafness and nerve deafness, and they may occur singly or in combination. The former is due to some obstruction to the passage of sound to the inner ear while the latter is due to

a defect of the inner ear or to the nerve fibres from this sensory organ. Infections of the middle ear give rise to many cases of conduction deafness often found in children in Group IIb but considerable mystery surrounds the predominant cause of deafness (*i.e.*, in those born deaf). Surveys show that among children in schools for the deaf and partially deaf about 60% are congenitally deaf. A further cause of severe deafness of the acquired type is meningitis—a cause of increasing significance in England in the 1950s. Maternal rubella during the first three months of pregnancy had been a new and serious cause of deafness in Australia but instances in the United Kingdom had been much rarer.

Nerve deafness may be inherited, but the proportion of such cases is small. The incidence of deafness sufficiently severe to demand special education varies from place to place and country to country and is approximately 1 to 1,000 of the child population in the United Kingdom.

History of the Education of the Deaf—The history of the education of the deaf begins properly in the 16th century. Before this time those born deaf were the subject of philosophic speculation but it was generally assumed that they were incapable of education. Pedro de Ponce (1520?–84) successfully taught some deaf pupils in Spain to speak, read and write and it is assumed that his methods were followed by Juan Pablo de Bonet who in 1620 published the first book on this subject. This gave rise to a wider interest in this subject in western Europe.

In England, John Bulwer (*d.* 1654) wrote on the subject of teaching the deaf to speak and read the lips, and he was followed by William Holder, D.D., F.R.S. (1616–98), John Wallis, D.D., F.R.S. (1616–1703) and George Dalgarno (1626?–87).

In France similar work had been carried on by the Abbe de l'Épée (1712–89) who made a most profound contribution in developing the natural sign language of the deaf into a systematic and conventional language to be used as a medium of instruction. His work was developed by the Abbe Sicard (1742–1822) and gave rise to the "silent method" of teaching the deaf.

In Germany, Samuel Heinicke (1707–90) educated deaf children orally and later Moritz Hill (1805–74), perhaps the greatest educator of the deaf of all time, developed this method. Thus arose the "oral method" of instruction which continued to influence the teaching of the deaf and in time became the accepted practice throughout the world. Thomas Bradwood (1715–1806) established the first school for the deaf in Great Britain, first in Edinburgh and later in London. This school was of a private nature but at this time the attention of the philanthropic public became focused on the needs of the deaf and funds were raised to establish schools for the deaf generally. The first school for the poor deaf was opened in the Old Kent road, London, in 1792 and later removed to Margate. In quick succession Edinburgh followed suit in 1810, Birmingham (1814), Liverpool (1825), Manchester (1825), Exeter (1827) and Doncaster (1829) until by 1870 ten residential institutions for the deaf had been established in England, four each in Scotland and Ireland and one in Wales. In these early institutions the method of instruction was generally a mixed one, and in certain cases an entirely silent mode of instruction was employed. The German or oral system, however, was gaining ground rapidly, and the Yorkshire institution adopted it in 1876. From this time onward the oral method, in which lip reading replaces hearing and the children are taught to use speech as a normal means of communication, advanced in favour, and for many years it has been the accepted method for the instruction of the deaf in the United Kingdom. In other parts of the world the oral method has proved acceptable although in some schools a combined method, in which oral methods are used in conjunction with manual communication, is used with success.

Education of the Deaf in the United Kingdom—During the greater part of the 19th century the education of deaf children depended entirely on the work of the charitable institutions, but following the Elementary Education act of 1870 further efforts to widen the field of state education gave rise to the Elementary Education (Blind and Deaf) act of 1893–94. This act (which had been anticipated in Scotland in 1890) made compulsory the

education of deaf children from the age of 7 to 16 years. In consequence further residential institutions and day schools were opened. From this time onward the schools for the deaf, whether in establishments maintained by independent governing bodies or in schools maintained by local authorities, became an integral part of the state system of education. The Education Act, 1944 further improved the position of deaf children and provided for the establishment of nursery schools for the deaf with optional attendance from the age of two years with the compulsory period continuous from 5 to 16 years. The act also allowed for the establishment of schools for the partially deaf and for schools for education of a more advanced type.

Schools for the Deaf and Partially Deaf—In England schools for deaf children may be either residential establishments or day schools or a combination of both. They may accept severely deaf or partially deaf pupils or in special cases both types. In general the older institutions appear as the residential schools and these are managed by independent bodies of governors. Day schools and other schools established since the beginning of state education are almost entirely managed by local education authorities. In addition to the types of schools for the deaf already mentioned there exist in England two schools for deaf children with additional defects established in 1946, a grammar school for the deaf where education for bright deaf and partially deaf children is taken to the standard of university entrance. Training in certain trades is given to deaf boys and girls between the ages of 16 and 19 years at a special department of the Royal Schools for the Deaf, Manchester.

Education whether at day or residential schools in the United Kingdom is free.

The Training of Teachers of the Deaf—Teachers in schools for the deaf must be qualified teachers and in addition must obtain a second qualification to teach deaf children. This second qualification may be obtained by practising teachers by passing the examination arranged by the National College of Teachers of the Deaf or by successfully undertaking a course of one year, for graduates or qualified teachers, which is arranged by the department of education of the deaf at Manchester university. Teachers of the deaf are paid according to the standard scales in operation and in addition receive special allowances for the extra qualification.

Research—Educational research into the many problems of deafness is carried on in the department of deaf education at Manchester university where there is also facility for postgraduate work. The Medical Research Council also fosters research on a wider basis into all aspects of deafness as does the National Institute for the Deaf. Special children's clinics also exist in the larger centres of population and these, modelled largely on the original clinic in the deaf department of Manchester university, deal in particular with the problems of deafness in children of preschool age.

British Commonwealth and Europe—In the British Commonwealth the pattern of education of deaf children is copied largely from that in England, and many of the teachers in such schools are recruited from this country or trained in the University of Manchester.

In Europe also the methods of education bear close resemblance to those in England and Scotland although in France and Spain schools will be found where the silent methods are followed to a much greater degree.

WELFARE OF THE ADULT DEAF

The welfare of the adult deaf (often known as the "deaf and dumb") is in the management of charitable organizations which were established in a manner somewhat similar to the older educational institutions (now residential schools) for the deaf. Since the passing of the National Assistance act, 1948, in England these independent bodies have received an increasing amount of public assistance but remain essentially as charitable organizations, each peculiar to its locality. Such a mission, or institute, for the adult deaf is controlled by a local committee who appoint a missionary or superintendent, who may or may not be an ordained

minister of religion, to organize its activities which are essentially of a social nature. Unlike schools for the deaf where the teaching method of communication is entirely oral (i.e., by speech and lip reading), the means of communication of the deaf members is generally a combined or mixed one, speech, signs and finger spelling being used in varying degrees.

The National Institute for the Deaf in London is concerned with all aspects of the welfare of the deaf and works through its central headquarters and through its regional associations. It is the recognized source of information on matters relating to the deaf. Other national bodies are the Royal Association for the Deaf and Dumb and the British Deaf and Dumb Association in organization managed by the deaf to further their own cultural interests. The Central Advisory Council for the Spiritual Care of the Deaf and Dumb furthers the spiritual welfare of the deaf throughout England and Wales.

UNITED STATES

The increasing emphasis on oralism in the United States by the 1950s was breaking down the barriers that separated the totally or partially deaf from normal people. The teaching of speech and lip reading became generally prevalent so that the use of communication is available to almost everyone. According to a survey in 1952, there was an estimated incidence of hearing impairment of about 10% of the total population, and about 2 1/2% of children had a handicapping amount of hearing impairment.

Education—The first attempt to teach a deaf mute recorded in the United States was by Philip Nelson in Rowley, Mass., 1679, but not until the early 19th century was concerted action taken to educate deaf children. Francis Green of Boston, Mass., whose deaf son was sent to Edinburgh, Scot., to be educated at Thomas Braidwood's institution, became much interested in the problem. With some ministers he attempted a census of Massachusetts in 1803, when 75 deaf were found. They then estimated that there were 500 deaf persons in the United States and urged the creation of a special school. In 1810 in New York city, the Rev. Dr. John Stanford found several deaf children in the city almshouses and tried to instruct them; efforts which later resulted in the founding of the New York institution. A grandson of Thomas Braidwood, John Bradwood, began to teach a family of deaf children in Virginia in 1812, later establishing a school. In 1812 an investigation disclosed 84 deaf in the Hartford (Conn.) area and an estimated 400 in New England and 2,000 in America. In 1815 a group of Hartford men organized a society to instruct the deaf, raised \$2,278 and sent a young minister, the Rev. Thomas Hopkins Gallaudet, to Europe to learn methods of teaching the deaf. Gallaudet studied the sign language method at the Abbe Sicard's school in Paris, which influenced the whole course of the education of the deaf in America. When Gallaudet returned in 1816, he was accompanied by the celebrated Laurent Clerc, himself deaf, one of the Paris institution's teachers. On April 15, 1817, the Hartford school was opened with subscriptions from other cities amounting to \$12,000 and an appropriation of \$5,000 from Connecticut, probably the first made in the United States for other than regular schools. It used the sign language, the manual alphabet and writing as the basis of instruction. In 1819 the federal government granted 23,000 ac. of public land, the proceeds from which formed a fund of \$339,000.

In May 1818 the New York Institution for the Deaf was opened with 62 pupils. After an exhibition by the students in 1819 the state legislature appropriated \$10,000 and granted "a proviso of the tax on lotteries in the city of New York" which for 14 years formed a good income.

In Philadelphia, Fr. David Seixas began teaching deaf children in his home in 1820. After an exhibition of results accom-

phished in 1821 he secured a charter and a per capita appropriation from the state of \$160. The Hartford school lent him Laurent Clerc. New Jersey began at once to send pupils to the Pennsylvania institution, Maryland followed in 1837 and Delaware in 1835. Kentucky in 1832 was the fourth state to establish a school for the deaf. The Kentucky asylum at Danville, which was the first school established distinctly as a state enterprise. In 1863, there were 22 schools for the deaf with 2,012 pupils. Within 60 years of the first foundation, they were established in 31 states, great areas of public land being granted in several instances, for such purpose. In all the institutions up to 1867, the manual system of instruction held sway, though the oral method had been tried at the New York institution.

In 1867 the Clarke school was established at Northampton, Mass., the first permanent oral school in the United States. The Institution for the Improved Instruction of the Deaf, New York City, also came into being in 1867 instituting oral instruction. Both schools exerted an influence on the early education of the deaf.

Educators of the deaf divided themselves into those who favoured the manual system supplemented by articulation and those who taught speech and lip reading, vetoing the manual method. Manual teachers maintained that certain deaf mutes would never learn to speak and to read lips, oral teachers considered it unjust to separate the deaf from the hearing because of lack of instruction in the use of vocal organs. Edward Miner Gallaudet's stand for the teaching of speech to deaf children after his extended European tour of 1867 influenced many instructors. In 1886 tension had modified sufficiently to permit the convention of Instructors of the Deaf to pass noteworthy resolutions urging endeavours in the schools to teach every pupil to speak and read from the lips. The resulting "combined system" was defined in the *American Annals of the Deaf*, the instructor's official organ as follows:

Speech and speech-reading are regarded as very important, but mental development and the acquisition of language are regarded as still more important. It is believed that in some cases mental development and the acquisition of language can be best promoted by the Manual method, and such method is chosen for each pupil as seems best adapted for his individual case. Speech and speech-reading are taught where the measure of success seems likely to justify the labor expended, and in some of the classrooms of most of the Combined System schools the Oral method is strictly followed.

The combined and the oral systems came into increasing use. Yet even in 1904 the World's Congress of the Deaf at St. Louis, Mo., ruled that champions of the oral method were not friends of the deaf and that every teacher of the deaf ought to have a working command of the sign language. Oralism was helped forward by the establishment of day schools. The Horace Mann school at Boston was the first, starting Nov. 10, 1869 under Sarah Fuller, principal for 41 years, who gave Helen Keller her first lessons in speech. The number of day schools increased slowly up to 1894 when there were 15, and more rapidly thereafter.

compulsory attendance laws for deaf children who are mentally competent. Admittance ages range from 3 to 8 and duration of attendance varies from age 16 to 25. More than half the states have day schools for the deaf in larger cities or a department for training deaf students within the existing school system. It has been estimated that 88.6% of the deaf in the United States have had some schooling. Every state requires periodic surveys for screening out children with hearing defects. Legal requirements vary from annual checks in some states to one survey every three years in others. In this way most children with hearing problems are recognized at least by school age. Students in residential schools for the deaf are given vocational training according to their aptitudes. If this is not sufficient or if facilities are limited, the vocational rehabilitation division of the U.S. office of education will assume the responsibility for further education providing the students' potential ability warrants the expenditure. The vocational rehabilitation division is a national agency with one or more regional offices in each state. This agency will also assist individuals who have sustained hearing impairment after the age of 18.

Most states have mobile clinics which visit each section or community once a year. Parents may bring their children to be examined, and the specialists there refer them to their local physicians for further medical care. Many of the larger cities have established audiology centres for the recognition of problems, hearing aid fittings and some rehabilitative measures. Hospital centres of note include an audiological service in the otolaryngology department or correlated with this medical service. In these areas the patient with impaired hearing receives not only complete medical care and audiological examination but a plan of therapy or recommended procedures. Each audiology and hospital centre maintains a staff of trained experts including an otologist, psychologist, physicist, speech and hearing specialist and social worker and usually has access to a psychiatrist. Although the United States pioneered in this field, other countries came to recognize its value and show great interest in following the U.S. example. These centres are to be found throughout the U.S. similar to those at Johns Hopkins (Baltimore, Md.), the State University of Iowa hospitals (Iowa City) and the Children's hospital (Los Angeles, Calif.). Some schools of higher education have concentrated courses for rehabilitating hearing defective individuals. This therapy includes speech correction, auditory training and lip reading. There are also summer camps which include therapists in these areas.

with departments for educating deaf blind children. Perkins institution, Watertown, Mass., New York Institute, New York City, Michigan School for the Blind, Lansing, Washington State School for the Deaf, Vancouver, Iowa State School for the Deaf, Council Bluffs, and California School for the Blind, Berkeley. Children from other states are sent to these schools on a tuition basis. The American Foundation for the Blind acts as a disbursing centre and clearing house for acceptance of fee basis students. This organization is an excellent source of material for parents seeking aid for deaf blind children.

DEAF-MUTISM, MEDICAL ASPECTS OF

Mutism or dumbness is almost always due to malformation or disease of the ear. Children learn to speak by imitating those about them who speak. Cases have occurred in which a child with normal hearing, brought up by deaf and dumb guardians in an isolated cottage in the mountains did not learn to speak until it came into contact with speaking people in a town.

The air vibrations constituting sound are conducted through the outer ear passage to the tympanic membrane, and from this through a chain of three small bones in the middle ear to the inner ear or labyrinth—the essential part of the organ of hearing. The inner ear itself consists of (1) the cochlea, which is concerned in hearing, and (2) the vestibule and three semicircular canals, which together are concerned with body equilibrium (See EAR, ANATOMY OF, HEARING). From the inner ear the cochlear and vestibular nerves pass to the corresponding centres in the brain. Lesions of the ear producing deafness serious enough to cause a child to become mute are almost always situated in the inner ear. Deaf mutes are usually classified as congenital cases, (abnormal development of the ears) or acquired cases, in which the ears, normal at birth, become diseased in childhood. About half the cases of deaf mutism are congenital.

Congenital Deaf Mutism may be endemic or sporadic. Endemic deaf mutism is peculiar to certain districts, notably Switzerland, and is associated with cretinism (*g v*). Cretinism is due to deficient activity of the thyroid gland. With increasing provision of iodine in the diet both cretinism and the associated endemic deafness are becoming less common, but cases still occurred at mid 20th century. In this type of case the middle ear is filled with connective tissue or bone instead of with air. The loss of hearing is not very profound, and the mutism is due largely to poor mental development.

Sporadic congenital deafness is usually due to failure of normal development or to degeneration in the inner ear. It is subdivided into the hereditary and the nonhereditary forms. Hereditary deafness may be total, but often the patient has considerable residual hearing, particularly for tones of low pitch. The hearing losses are usually very similar in the two ears. The vestibular portion of the inner ear, concerned with the sense of equilibrium, and the general structure of the temporal bone are usually normal. Most hereditary deafness is monogenic, due to a single recessive gene (see MENDELISM AND HEREDITY). When this gene is inherited from both parents the inner ear fails to develop normally. The implications of the single recessive gene are as follows.

Marriage between two persons with this type of deafness will result in similar deafness in all of their offspring. Marriage between a person with this deafness and one who, although hearing normally, is a carrier of the gene gives an even chance of deafness for each child and the hearing children will all be carriers. Between two carriers there is a one-in-four chance of deafness for each child and a two-out-of-three chance that the hearing children will be carriers. Marriage between a carrier and a person who is not a carrier will result in no deaf children, but an even chance that each child will be a carrier.

There is also a rarer form of hereditary deafness, apparently

due to a single dominant gene which causes deafness if inherited from either parent. Still other rare hereditary forms are associated with abnormal development of the external ear canal or of other sense organs or parts of the nervous system. In some cases the child may have normal hearing for several years and then suffer a gradual and more or less complete loss of hearing from degeneration of some or all of the sensory cells in the cochlea. (This form of deafness is quite distinct from otosclerosis. The latter is also a hereditary disease and causes partial hearing loss in early adult life, but the abnormality in otosclerosis is in the sound-conducting mechanism, not in the sensory cells, and the hearing loss is rarely severe enough, nor does it occur early enough, to be a significant cause of deaf mutism.)

Nonhereditary congenital deafness is usually due to a disease of the mother which is either transmitted to the child, or which by its toxins causes abnormal development of the inner ear in the foetus. Congenital syphilis is the commonest example of the first situation, here the deafness usually develops in the preadolescent period. German measles (rubella), and probably also mumps, influenza and some other infectious diseases in the mother during the first three months of pregnancy are important examples of the second situation. Here the affected children are born deaf or hard of hearing.

Acquired Deafness occurring early enough to cause deaf mutism is also usually due to disease of the inner ear. Mechanical injury, such as fracture of the skull, is a rare cause. Sometimes an untreated infection of the middle ear in a severe case of scarlet fever, measles or influenza, or even a common cold may break through into the inner ear. Infection reaches the middle ear from the pharynx by way of the Eustachian tube. Pus forms in the middle ear (otitis media), and if the infection also invades the inner ear, it destroys the organ of hearing and the vestibular mechanism as well. Toxins also sometimes cause degeneration of the delicate sensory cells without the formation of pus and without any localized infection in the middle ear. Probably about half of the cases of severe acquired deafness in childhood are due to scarlet fever, measles, influenza, pneumonia, whooping cough, diphtheria and mumps.

Meningitis is the commonest single cause of acquired deafness. This infection spreads from the coverings of the brain, the meninges, along the sheath of the auditory nerve to the inner ear. The destruction of the sense organs of hearing and of equilibrium is usually complete. In one survey (1927) of children in public schools for the deaf in several midwestern states of the U.S. meningitis alone was found to have caused about one fifth of the cases of acquired deafness. In the U.S. army in World War II meningitis was so well controlled by chemotherapy that it was a negligible cause of deafness, in contrast to its position as the leading cause of total deafness in World War I. Its importance as a cause of deaf-mutism in children may likewise be expected to decrease.

The incidence of deaf-mutism has varied from about 43 per 100,000 in Denmark and 47 in the United States, to 80 in England and Wales, 87 in Sweden and 129 in Switzerland. The high figure for Switzerland is due to the presence of endemic deafness. The differences in incidence among the other countries are due in part to differences in the definition of deaf mutism.

Diagnosis—It is particularly important in diagnosis to determine whether or not a mute child is totally deaf, whether he has a significant amount of residual hearing, or whether his muteness is due to a disorder of the language function. Congenital aphasia (see APHASIA) may closely resemble true deaf-mutism and its nature may be demonstrated only when, after patient education has built up his understanding of auditory language, the child's hearing is found to be practically normal. And even if a child has a real and severe hearing loss, the loss may be less than appears on casual examination because such a child forms the habit of disregarding his few weak auditory sensations. A powerful hearing aid, particularly the group instruments used for instruction in most schools for deaf children, may be used to good advantage if there is a small amount of residual hearing.

Any conclusion as to the presence or absence of residual hearing must be made by an experienced examiner who knows how to distinguish

PATHOLOGICAL ASPECTS OF DEAF-MUTISM

- 1. Normal cochlea of dog. (1) Reissner's membrane. (2) Normal stria vascularis. (3) Spiral prominence. (4) Normal basilar membrane. (5) Normal cochlear duct. (6) Normal organ of Corti. (7) Normal tectorial membrane.
- 2. Degenerated Reissner's membrane. (1) Degenerated Reissner's membrane. (2) Atrophied stria vascularis. (3) Basilar membrane cochlear canal largely filled with a mass of cells and colloid material. (4) Congenital deaf mutism with dilated cochlear canal. (5) Reissner's membrane atrophic, upper part. (6) Membrana tectoria absent. (7) Dilated cochlear canal.
- 3. Basilar membrane with degenerated Corti's organ. (1) Basilar membrane with degenerated Corti's organ. (2) Dilated cochlear canal. (3) Basilar membrane with degenerated Corti's organ. between a child's reaction to actual sound and his ability to see and to feel vibrations. Parents' opinions as to whether a child hears or not are notoriously biased by wishful thinking. A child may even learn to hear by sight.

established. It is important, however, to begin special education by the fourth or fifth year at the latest, preferably in one of the many institutions, public or private, that specialize in this type of instruction (See DEAF AND HARD OF HEARING, EDUCATION OF.)

DEÁK, FRANCIS (FERENCZ) (1803–1876), Hungarian statesman, was born at Sojtor in the county of Zala on October 17, 1803. Of an ancient and distinguished family, he was educated for the law and practised first as an advocate and ultimately as a notary. His reputation in his own county was quickly established and when in 1833 his elder brother, Antal, was obliged by ill-health to relinquish his seat in the Hungarian parliament, the electors chose Ferencz in his stead. No man owed less to external advantages. He was to all intents and purposes a simple country squire. His true greatness was never exhibited in debate. It was in friendly talk, generally with a pipe in his mouth and an anecdote on the tip of his tongue, that he exercised his extraordinary influence over his fellows. He convinced them from the first of his disinterestedness and sincerity, and impressed them by his instinctive faculty of always seizing the main point and sticking to it. Perhaps he is unique in history, for though neither soldier, nor diplomatist, nor writer he became the leader of a great party by sheer force of intellect and moral superiority. This is all the more remarkable because he appealed to no passion but patriotism, and avoided power instead of seeking it.

During the struggle between Austria and Hungary for the preservation of the Hungarian constitution, Deák and Count Stephen Széchenyi were the leaders of that party who wished all proceedings to be conducted in a strictly legal manner, and who therefore were opposed to the extreme revolutionary methods of Kossuth and his followers. In the diet of 1839–40 it was Deák who brought about an understanding between a reactionary government in need of money and recruits for the army and a Liberal opposition determined to vindicate Hungary's political rights. He did not sit in the diet of 1843–44 because his election was the occasion of bloodshed in the struggle between the Clericals who would have ousted him and the Liberals who brought him in. After the constitutional victory of 1848 he became minister of justice in the Batthyány ministry. All through the stormy days that followed, culminating in the War of Hungarian Independence, he never ceased to urge moderation and the adoption of a strictly legal position, but Kossuth and the extremists got the upper hand. "You cannot argue with a drunken man," he is reported to have said, "and at the moment the diet is drunk." When it became obvious that the Viennese Government did not intend to keep its promises to Hungary, Deák resigned with Batthyány, but without ceasing to be a member of the diet. He was one of the parliamentary deputation which waited in vain upon Prince Windischgrätz in his camp. He then retired to his estate at Kehid. After the War of Independence he was tried by court martial but acquitted.

After 1854 he spent the greater part of his time in Pest, where his room at the "Queen of England" inn became the centre for those patriots who in the dark days of the Bach administration looked to his wisdom for guidance. He did all in his power to stimulate the moral strength of the nation and to keep its hopes alive. He considered armed resistance dangerous, but he was the immutable defender of the continuity of the Hungarian constitution on the basis of the reforms of 1848. The Kossuth faction looked for salvation to a second war with Austria engineered from abroad, while the followers of Széchenyi adopted an attitude of resignation, equally repugnant to Deák.

The Italian war of 1859 convinced the Austrian Government of the necessity of a reconciliation with Hungary. Bach was replaced by Schmerling and an imperial patent of April 19, 1860 removed some of the chief grievances of the Magyars. The October diploma of the same year was intended to provide the empire with a federal system of government on constitutional lines. Deák rejected it, but at the request of the government he went to Vienna to set forth the national demands. He insisted on the re-establishment of the constitution in its integrity as a *sine qua non*. On February 16, 1861 the government withdrew the diploma and issued a patent which was a return to the former centralist and bureaucratic system. On April 6 the diet met at Pest. Deák rose to defend the national right and traditions, and on June 5 moved an address to the crown refusing to recognize the February patent, insisting on the laws of 1848 as the sole basis of accord, and reminding the Emperor that an uncrowned king was no true sovereign of Hungary. The speech of Deák on this occasion was his finest effort and he was acknowledged the leader of the nation by all parties. He next proposed to the emperor that he should break away from counsellors who had sought to oppress Hungary, and restore the constitution as a personal act. The emperor thereupon dismissed Schmerling, suspended the February constitution and summoned the coronation diet. Of that diet Deák was the indispensable leader, and all parties left him to conduct the delicate negotiations with the emperor. The committee of which he was president had completed its work when the Austro-Prussian War broke out. The extreme party would have used the defeat of Königgrätz to extort still more favourable terms, but Deák made it easy for the emperor in the hour of his humiliation. To his question, "What does Hungary demand?" Deák answered, "Nothing more after Sadowa than before it." On Feb. 18, 1867 the restoration of the Hungarian constitution was publicly announced in the diet, and a responsible ministry was formed under the premiership of Count Julius Andrássy. Deák himself refused to take office. There was still one fierce parliamentary struggle, in which Deák defended the compromise (*Ausgleich*) of 1867, both against the Kossuthites and against the Left-centre, which had detached itself from his own party under the leadership of Kálmán Tisza (*q.v.*). It was the wish of the diet that Deák should exercise the functions of a palatine at the coronation, but he refused the honour, just as he had refused every other reward and distinction. "It was beyond the king's power to give him anything but a clasp of the hand." His reward was the assurance of the prosperity and tranquillity of his country and the reconciliation of the nation and its sovereign. This service reconciled him to the loss of much of his popularity, for a large part of the Hungarian people looked upon the compromise of 1867 as a surrender and blamed Deák for it. He died at midnight of July 28–29, 1876, his funeral was celebrated with royal pomp on Feb. 3. A mausoleum was erected by national subscription and in 1887 a statue overlooking the Danube was erected to his memory.

See *Speeches* (Hung.) ed. by Manó Kónyi (Budapest, 1892), *Life of Deák* (Budapest, 1892), *Memorials of Ferencz* (Budapest, 1889–90), Ferencz Pulszky, *Charakteristika* (1876), R. Springer, *Die Krise des Dualismus und das Deakistische Epochen in der Geschichte der Habsburgerarchie* (Vienna and Leipzig, 1904), L. Eisenmann, *Le C. Austro-Hongrois de 1867* (1904).

several important ministerial posts. After the fall of the coalition ministry in 1895 he resumed a private member of the legislature, though office was repeatedly offered to him, until 1900. In that year he came to London to discuss with Chamberlain more particularly the legal points in the Australian Commonwealth Constitution Bill. In Victoria his public speeches helped on the Federation movement and in 1901, as attorney-general, he was included in the first Federal cabinet of 1901. During his legislative career in Victoria he was active in promoting social legislation and an ardent advocate of preference in favour of Great Britain. This fiscal policy he pursued during his three Federal premierships (1903-04, 1905-08, 1909-10), and supported Australia's co-operation in imperial defence, being responsible for the inception of the measure authorizing Australian naval construction in 1909, and for the invitation to Lord Kitchener to visit Australia and report on the question of defence. After 1910 he led the Opposition in the Australian parliament until compelled to retire, owing to ill health, in 1912. He died at Melbourne on Oct. 7, 1919. Deakin had made a special study of the irrigation problem, and wrote three books on irrigation in Western America (1885), in Egypt and Italy (1887), and in India (1892). The Irrigation Act of 1886 was largely his work.

See W. Murdoch, *Alfred Deakin* (1923), B. R. Wise, *Making of the Australian Commonwealth* (1913).

DEAL, a seaport and municipal borough in the Dover parliamentary division of Kent, England, 9½ mi. NNE of Dover on the Southern railway. Pop. (1938) 23,440. Area 4.5 sq. mi. It consists of Lower Deal, on the coast, Middle Deal, and about a mile inland, though formerly on the coast, Upper Deal, which is the oldest part. The borough was extended in 1935 to include the urban district of Walmer and other areas. Frequented as a seaside resort, the town derives further importance from its vicinity to the Downs, a fine natural road-track between the shore and the Goodwin Sands, about 9 mi. long and 6 mi. wide, in which large fleets of windbound vessels may be protected against the north, west and easterly gales. The trade consists in the supply of provisions and naval stores, which are conveyed to the ships in need of them by "hovellers," as the boatmen are called along the Kentish coast. The Deal hovellers, pilots and lifeboatmen are famous for their skill. Fishing curing and a few other industries are carried on. St Leonard's church in Upper Deal dates from the Norman period. The site of the old navy yard is occupied by villas. The esplanade, nearly 4 mi. long, extends through Walmer to the south, and north to the ruins of Sandown castle, and has a promenade pier, owned by the corporation. The golf links are well known. At the south end of the town is Deal castle, erected by Henry VIII in 1539, together with the castles of Sandown, Walmer and Sandgate. They were built alike and consisted of a central keep surrounded by four lunettes. Sandown castle was the prison in which Col. Hutchinson, the Puritan soldier, was confined and is said to have died, September 1664. It was removed on becoming endangered by encroachments of the sea. The "captain" of Deal castle is appointed by the lord warden of the Cinque Ports.

Deal is one of the possible sites of the landing place of Julius Cæsar in Britain. Later in the period of Roman occupation the site was inhabited by a Saxon port. In the Domesday Survey, Deal (*Drele*, *Drele*, *Drele*) is mentioned among the possessions of the bishops of St. Martin, Dover, is said to be the 11th of the Buresborough and Combe, it seems from early times to have been a port in the history of the Cinque Ports as a member of Sandwich but was not continuously reckoned as a member before the reign of Henry VI. In the time of Henry VIII Deal was a fishing village half a mile from the sea but in the 16th century the navy and the mercantile trade brought ships in increased numbers to the Downs. Deal or New Deal was then built along the shore. William III incorporated the town in 1695-96 and granted a market and fairs with a court of the Mayor. The Cinque Ports were first represented in the parliament of 1255, the 150 members returned by Sandwich, Deal, Dover and Hythe. Deal and Walmer until they were disfranchised in 1835. In 1841 Deal

11,200 houses had been damaged by German air raids by the end of 1941.

DEAL, A British term commonly used to designate the soft woods derived from the Scotch pine (*Pinus sylvestris*) which is called white deal, and the spruce fir (*Abies excelsa*) which is called white deal. The former is by far the better timber. Deal is freely imported into the British Isles from Scandinavia and Russia, and so widely used for building and other purposes that the world is threatened with a soft-wood famine.

The term deal (derived from Dan *dele*, plank) is also used as the name of a soft-wood measurement. A deal in England is a piece of pine wood 12 in. or 14 in. wide and 2 to 4 in. thick, not less than 8 ft. long. (See **TIMBER**.)

DEALER, one who sells at retail to the public. This term is used to cover nearly all retailers except department and chain stores, and in the loose parlance of trade it is sometimes applied to the individual units of chain store systems. The term "dealer" formerly meant one who bought and sold primarily without a place to stock a quantity of merchandise, he was sometimes also referred to as a "curb dealer", i.e., one who transacted his business from the sidewalk.

DEALFISH, the name applied to marine fishes of the genus *Trachipterus*, which, together with the carish (*q.v.*), comprises the family Trachipteridae, or ribbonfish. Dealfish inhabit the middle waters, probably not below 200 fathoms, and are characterized by their long, laterally compressed bodies, short head, narrow mouth and feeble dentition. The dorsal fin extends the length of the back, the anal is absent, and the caudal, when present, is reduced. The pectoral fins are small. In young dealfish some of the fin rays are prolonged in an extraordinary way. Dealfish may reach a length of eight feet. They have a world wide distribution. All the specimens found at the surface of the sea have been more or less mutilated by the release from the enormous pressure under which they are accustomed to live. The commonest species is *T. arcticus*.

DEAN, primarily one having authority over ten, the title of an ecclesiastical dignitary, or of a university or civil official (Lat. *decanus*, from Gr. *deka*, ten).

The original use of the word *decanus* was evidently to denote a military grade. It occurs in this sense in the *De Re Militari* of Vegetius (c. 386). Slightly later (c. 400), St. Jerome uses it in the Vulgate, instead of the *decano* of the Old Latin version, for the "rulers of tens" in Exod. xviii. 21, 25. It was also applied, from the late 4th century onwards, to the members of a guild, whose occupation was the burial of the dead, as well as to certain minor officials of the imperial household, and in later times of the empire to various civil functionaries. In the Visigothic and Lombard codes it occurs as the title of a subordinate judge, having jurisdiction within a district called a deanery (*decania*) or tithing, in the Anglo-Saxon system the corresponding official was entitled dean, tithing man or head borough.

In monastic life the term was used at an early period to denote a monk having charge of ten monks (St. Augustine, *De Mor. Eccl. Cath.*, i. 31, etc.), and it occurs in this sense in the Rule of St. Benedict (ch. 21). As monachism developed the title came to be applied to various special functionaries, e.g., *foris decanus*, i.e., monk responsible for the external business of a monastery.

In the 11th century the word denoting the head of a cathedral or collegiate chapter, the title probably owes its origin to this monastic usage. In certain of the cathedrals were in the charge of monks. In the 6th century the *decanus* as a cathedral official was subordinate to the *præpositus* or provost, who presided over the chapter as the bishop's vicar, but, during the next few centuries deans were almost everywhere substituted for provosts.

The office of rural dean representing one of the early archbishopric (*q.v.*), is of great antiquity in the Western Church, going back to the time (at least as early as the 6th century) when the bishops of the large dioceses found it necessary to subdivide the diocese into districts called archiepiscopates or deaneries (*decanatus*), each with an archpriest (later called rural dean) as its head. This functionary supervised the local clergy, and to some extent represented the bishop within his district, but was

(where he was taken prisoner and exchanged), battle of Saratoga, Valley Forge, battle of Monmouth, Sullivan's expedition against the Indians, and the siege of Yorktown. He kept a detailed journal throughout the war, which gives a valuable first hand account of the principal campaigns of the Revolution. Upon the organization of the Government, President Washington designated him United States marshal for the District of Maine, and in 1792 he was elected to Congress, where he served as a Republican for two terms. He was secretary of War through the administration of President Jefferson, 1801-1809. In 1803 he issued an order for "erecting barracks and a strong stockade" at "Chikago," "with a view to the establishment of a Post." The important part which this post, Fort Dearborn, played in the early history of Chicago, has given his name a lasting association with that city. In Jan. 1812, President Madison appointed him senior major general of the United States Army. Upon the outbreak of hostilities with England, he undertook to carry out an extensive plan of campaign, including an invasion of Canada at several points. After a long succession of delays and reverses, he was relieved of his command in July 1813. In 1822, President Monroe appointed him minister to Portugal. He died in Roxbury, Mass. (H. D. SM.)

DEARBORN, a city of Wayne county, Michigan, U.S.A., 10 mi W of Detroit, on the Michigan Central railroad. The population was 2,470 in 1920 but grew rapidly to 50,358 in 1930, and was 64,529 in 1950 by the federal census. It is a residential suburb and is known as the home of Henry Ford (*q.v.*), who was born on a farm in the city. Ford restored the farm to its early appearance, and built at Dearborn a "museum village" of old buildings collected from all parts of the United States and from England.

DEATH, the permanent cessation of the vital functions in the bodies of animals and plants, the end of life or act of dying. The word is the English representative of the substantive common to Teutonic languages, as "dead" is of the adjective, and "die" of the verb, the ultimate origin is the pre-Teutonic verbal stem *da-*, cf. Ger *Tod*, Dutch *dood*, Swed. *dad*.

For the scientific aspects of the processes involved in life and its cessation see **BIOLOGY**, **PHYSIOLOGY**, **PATHOLOGY**, and allied articles, and for the consideration of the prolongation of life see **LONGEVITY**. Here it is only necessary to deal with the more primitive views of death and with certain legal aspects.

Ethnology—To the savage, death from natural causes is inexplicable. At all times and in all lands, it reflects upon death at all he fails to understand its rational philosophy. If a man dies without being wounded he is considered to be the victim of the sorcerers and the evil spirits with which they confront. Therefore, since the death of anyone is ascribed to the magic arts of the sorcerers he is to be made to atone at a high price. A culprit is executed, covered either by an appeal to a local diviner or by torturing some one into confession. In Australia, whenever a native dies, no matter how evident it may be that death has been the result of natural causes, it is at once set down that the defunct was bewitched. Even to-day the peasantry of many European countries believe that all disease is the work of demons. Sleep and trance are regarded as the temporary, death as the permanent, absence of the soul regarded as the vital principle, as the moral principle and as the intellectual principle. It may be diffused all through the body but can be concentrated in one organ (see **HEAD HUNTING**). It inheres in each and every part in excreta and hair clippings and for safety may be hidden in some external object.

The body's shadow or reflection is the soul, and subject to a

malice of enemies. The soul is pictured as a man's breath (*anima*), and the word "breath" has become a synonym for life itself. The phrase "last breath" expresses the savage belief that there departs from the dying in the final expiration a something tangible, capable of separate existence—the soul. Myths account for its origin. Sometimes it is a "baby" which has been broken and gives Death power over man. In India Yama, the god of Death, the first man, married his sister and thereby violated the fundamental law of exogamy, breach of which to this day in many cases still entails actual as well as civil death. In other myths, men were destined by Divine Mercy to be immortal but the mesenger of the glad tidings failed or erred.

See Sir J. G. Frazer, *The Belief in Immortality*, vol. 1 (1913), *The Golden Bough* (Perils of the Soul).

REGISTRATION

Legal Requirements—The registration of burials in England goes back to the time of Thomas Cromwell, who in 1538 instituted the keeping of parish registers. Statutory measures were taken from time to time to ensure the preservation of registers of burials, but it was not until 1836 (the Births and Deaths Registration Act) that the registration of deaths became a national concern. The law for England was consolidated by the Births and Deaths Registration Acts 1874 and 1926. Under the former act, the registration of every death and the cause of the death is compulsory. When a person dies in a house information of the death and the particulars required to be registered must be given within five days of the death to the registrar to the best of the person's knowledge and belief by one of the following persons—(1) The nearest relative of the deceased present at the death, or in attendance during the last illness of the deceased. If they fail, then (2) some other relative of the deceased in the same sub-district (registrar's) as the deceased. In default of relatives, (3) some person present at the death, or the occupier of the house in which, to his knowledge, the death took place. If all the above fail, (4) some inmate of the house, or the person causing the body of the deceased to be buried. The person giving the information must sign the register. Similarly, also, information must be given concerning death where the deceased dies not in a house.

Where written notice of the death, accompanied by a medical certificate of the cause of death, is sent to the registrar, information must nevertheless be given and the register signed within 14 days after the death by the person giving the notice or some other person as required by the act. Failure to give information of death, or to comply with the registrar's requisitions, entails a penalty not exceeding 40 shillings, and making false answers to any question put by the registrar relating to the particulars required to be registered, or making false statements with intent to have the same inserted in the register, is punishable either summarily with a penalty of £10, or on indictment, with penal servitude for seven years, or with imprisonment for two years with or without hard labour.

The registrar, upon registering the death, must forthwith give to the person giving the information a certificate under his hand that he has registered the death, but where he has received written notice of the death, accompanied by a medical certificate of the cause of death, he may, before registering the death and subject to such conditions as may be prescribed, give to the person sending the notice, if required to do so, a certificate under his hand that he has received notice of the death.

The body of the deceased cannot be disposed of before the certificate of the registrar, or order of the coroner, has been delivered to the person effecting the disposal, i.e., the person by whom the register of burials in which the disposal is to be registered is kept, or, in the case of a burial in a churchyard or graveyard of a parish or ecclesiastical district under the Burial Laws Amendment Act 1880, the relative, friend, or legal representative who is responsible for the burial of the deceased. Where, however, the disposal is by burial, the person effecting the disposal may proceed with the burial if satisfied by a written declaration in prescribed form by the person procuring the disposal that a certificate or order has been issued. The person effecting the dis-

FROM A WOODCUT BY HANS HOLBEIN THE YOUNGER
SIXTEENTH CENTURY PORTRAYAL OF DEATH

posals must, within 96 hours of the disposal, notify the registrar in the prescribed manner as to the date, place and means of disposal. The registrar, on the expiration of the prescribed period after the issue of a certificate by him or of a coroner's order, if, no notification as aforesaid has been previously received by him, must make inquiry of the person to whom the certificate or order was given, and such person must give information to the best of his knowledge and belief as to the person having the custody of the certificate or order, the place where the body is lying, or, if disposed of, the person effecting the disposal.

It is the duty of the father or mother of a still born child to give information to the registrar of the particulars required to be registered concerning the still birth. Upon doing so, he or she must either (1) deliver to the registrar a written certificate that the child was not born alive, signed by a registered medical practitioner or certified midwife who was in attendance at the birth or who has examined the body, or (2) make a declaration in prescribed form to the effect that no such practitioner or midwife was present at the birth, or has examined the body, or that his or her certificate cannot be obtained and that the child was not born alive.

The registration of deaths at sea is regulated by the Births and Deaths Registration Act 1874 together with the Merchant Shipping Act 1894.

Death can be proved by the production of a certified copy of the entry in the register of birth and deaths, which is evidence not only of the fact of death, but also of the date of death, the sex, rank, or profession of the dead person, and the cause of death.

Presumption of Death.—The fact of death may, in English law, be proved not only by direct but by presumptive evidence. When a person disappears and is not heard of for seven years, the presumption of law arises that he is dead (*Nepean v Doe*, 1837, 2 M and W 894). In Scotland, by the Presumption of Life (Scotland) Act 1891, the presumption is statutory. In those cases where people disappear under circumstances which create a strong probability of death, the court may, for the purpose of probate or administration, presume the death before the lapse of seven years (see *In the Goods of Matthews*, 1898, p. 17). The question of survivorship, where several persons are shown to have perished by the same calamity, has been much discussed. It was at one time thought that there might be a presumption of survivorship in favour of the stronger party. But it is now clear that there is no such presumption, the question is one of fact depending wholly on evidence, and, if the evidence does not establish the survivorship of any one, all must be taken to have died at the same moment (*Wong v Angrove*, 1860, 8 H L Cas 183). This rule has been applied by the court of probate where husband and wife were both killed in a railway accident, and the bodies were found two hours afterwards, and administration was granted to their respective next of kin (*In the Goods of Wheeler*, 1861, 31 L J P M & A, 40), so also where husband and wife were proved to have been on board a ship which was supposed to have been lost at sea (*In the Goods of Alston*, 1892, p. 142).

Civil Death is an expression used in law in contradistinction to natural death. Formerly, a man was said to be dead in law (1) when he entered a monastery and became professed in religion, (2) when he abjured the realm, (3) when he was attainted of treason or felony. Since the suppression of the monasteries there has been no legal establishment for professed persons in England, and the first distinction has therefore disappeared, though for long after the original reason had ceased to make it necessary grants of life estates were usually made for the terms of a man's natural life. The act abolishing sanctuaries (1623) did away with civil death by abjuration, and the Forfeiture Act 1870, that on attainer for treason or felony.

For the statistics of the death rate of various countries see DEATH RATE. See also ANNUITY, CAPITAL PUNISHMENT, CREMATION, INSURANCE, ARTICLES ON, MEDICAL JURISPRUDENCE, etc.

THE UNITED STATES

Legal Registration.—It is generally provided that the State department of health shall have charge of the registration of

deaths, shall provide the necessary forms and blanks for obtaining and preserving such records, and shall procure the faithful registration of each death. For this purpose the States are, as a general rule, divided into registration districts, sometimes called vital statistics registration districts, in each of which there is a registrar charged with the registration of births and deaths. In Massachusetts and in some other States this duty is imposed upon each town clerk.

It is provided by statute in most States that the body of any person whose death occurs in the State shall not be buried, cremated, deposited in a vault or otherwise disposed of or removed from or into any registration district, or be temporarily held pending further disposition, more than 72 hours after death unless a permit for burial removal or other disposition shall have been properly issued by the registrar of the district. Whenever it is practicable, no such burial or removal permit shall be issued by any registrar until a complete and satisfactory certificate of death has been filed with him. If, however, a dead body is transported from one State into a district in another State, the transit or removal permit issued in accordance with the law of the place of death has the force of a burial permit. It is frequently required that the certificate of death shall be of the standard form recommended by the United States Bureau of the Census and adopted by the American Public Health Association and shall contain—(1) the place of death, including the State, county, township, village or city, (2) the full name of the decedent. If an unnamed child, the surname preceded by "unnamed", (3) sex and colour or race—as white, black, mulatto, Indian, Chinese, Japanese, etc., (4) conjugal condition, whether single, married, widowed or divorced, (5) place and date of birth, including year, month and day, (6) age in years, months and days, (7) name of father and maiden name of mother, (8) birth-place of mother, (9) occupation, (10) signature and address of informant, (11) date of death, year, month and day, (12) statement of medical attendance on decedent, fact and time of death, including time last seen alive, (13) cause of death, (14) signature and address of physician or official making medical certificate, (15) place and date of burial or removal, (16) signature and address of undertaker, (17) official signature of registration with date when certificate was filed and registered number.

The personal statistical particulars should be authenticated by the signature of the informant, who should be the nearest of kin or other competent person acquainted with the facts. The statement of the facts relating to the disposition of the body shall be signed by the undertaker. The medical certificate shall be made and signed by the legally qualified physician, if any, last in attendance on the deceased. The cause of the death must generally be stated so as to show the disease or sequence of causes resulting in the death.

In regard to the registration of still-born children, in some jurisdictions the law provides that the child shall be registered as a birth and also as a death, and separate certificates of birth and death shall be filed with the registrar, in others, the still-born child is merely registered as a death. A certificate is not required for a child that has not advanced to the fifth month of inter gestation.

If a death occur without medical attendance, it is the duty either of the undertaker or other person who learns of the death to notify the local health officer. The latter immediately investigates and certifies the cause of death. If, however, he has reason to believe that the death may have been due to unlawful act or neglect, he refers the case to the coroner for his investigation and certification. The undertaker must file the certificate of death with the local registrar, and obtain a burial or removal permit prior to any disposition of the body, which he delivers to the person in charge of the place of burial.

Presumption of Death.—The fact of death may, as a general rule, be proved by presumptive evidence. An unexplained absence of seven years at common law raised a presumption of death. This is still the period in most jurisdictions in this country, though a few have by statute adopted a shorter period, e.g., five years in Arkansas, and five years in Indiana for the sole purpose of

authorizing the administration of an estate. Death may in some cases be presumed from the facts surrounding the disappearance indicating death within a shorter time than seven years. The English rule prevails in the United States that the presumption is of the fact of death only and not of the time of death. There are some cases, however, in which death has been presumed to have occurred at the expiration of the seven year period.

Survivorship—In the absence of circumstantial evidence, in the case of a common disaster, there is as a general rule no presumption as to survivorship. In some States, however, there are codes embodying certain presumptions as to survivorship. Other wise, the law will treat the case as one to be established by evidence, and the burden is placed on him who claims survivorship.

DEATH, BIOLOGICAL ASPECTS OF The life cycle of individual multicellular organisms standing relatively high in the scale of organic specialization, as for example, a fly, a bird or a man, is typically divisible into five biologically differentiated, and usually distinct, phases as follows: (a) The formation of the *zygote*, which is the individual, by the union of ovum and spermatozoon in the process called fertilization. The life-history of the individual is a distinct biological entity, begins with this event. (b) The period of development and growth, which has two sub-phases, commonly designated respectively as embryonic or foetal, and post embryonic or post natal. The duration of this growth phase of the life cycle varies widely in different organisms, as from 8 to 10 days in the fruit fly, *Drosophila*, to more than 20 years in man. This phase comes normally to an end in most forms of higher animal life, and is succeeded by (c) the phase of adult stability, in which no marked changes are observable either in the direction of growth or degeneration. This phase is the "prime of life" in common parlance. Its duration in time is again widely variable. Sooner or later the individual can

FIG. 1—SURVIVAL RATES FOR MAN, A FRUIT FLY (*DROSOPHILA*) AND WATER ANNELULUS (*PROALES*) AT CORRESPONDING AGES. The lower figures are the biologically equivalent life spans represented as equal and divided into 100 units.

be observed to have passed definitely into the next phase of the life cycle, which may be designated (d) the period of senescence. This phase is characterized by a progressive waning in the intensity of the vital processes generally, accompanied by regressive and degenerative changes in the structures of the body. The duration in time of this portion of the life-cycle again varies greatly, but ultimately, in all the more highly specialized organisms, the life of the individual, as such, comes to an end with the terminal event of the cycle (e) death. By this term is designated the cessation of all vital capacity.

The Cycle of Life—In the cycle of individual life as outlined, the most significant phases biologically are obviously (b) growth and (d) senescence. Phases (a) and (e) (fertilization and death) are the terminal events of the important periods (b) and (d). Phase (c) is transitional between (b) and (d), and may be wholly absent, as when obvious senescence changes follow immediately upon the cessation of obvious growth. Indeed it is doubtful if phase (c) has theoretically any place in the life cycle at all. Perhaps in cases where a stable adult plateau in the middle of the cycle seems to exist, it merely means that the changes of growth or of senescence are proceeding at too slow a rate to be observable by the relatively crude methods available.

In the case of the human species phases (b) (c), and (d) are rather definitely and precisely limited by the biological phenomena of birth, puberty (precisely established in the female by the onset of menstruation, or *menarche*), the ending of the capacity to reproduce (marked in the female by the cessation of menstruation, or *menopause*) and its diminution to statistically insignificant proportions in the male at about the same age), and death. Pearl has shown (*The Natural History of Population*, 1936) that the average age at menarche, for large samples covering many different countries and peoples, is very close to 15 years, and that the average age of menopause for similarly representative samples is between 47 and 48 years. So, in round figures, human life after birth can be divided into three periods: (1) *The pre-reproductive period of infancy and childhood*, extending from birth to about 15 years of age. In this period the individual is incapable of self-maintenance or support on its own unaided resources, as well as of reproduction. (2) *The reproductive period*, extending from about 15 to about 50 years. In this period of life the work that supports the human socio-biological structure is mainly done, as well as the reproducing that continues the species. (3) *The post-reproductive period*, extending from about 50 years to the end of life. In this period the old, besides being incapable of reproduction to any statistically significant degree, are in large part dependent for their support upon the work done in the middle (reproductive) period of life, either by themselves with a concomitant saving for old age of the products of their efforts, or by others.

When statistics of population are arranged according to this threefold age classification a striking regularity or rule may be observed all over the world. This regularity may be stated as follows: Very generally just about one half of the whole living population falls in the middle age group (15-49 years inclusive), while the other half is made up of the young (0-14 years inclusive) and the old (50 years and over) together, these two latter groups standing statistically in a compensatory relation to each other. In populations where there is a high proportion in the 0-14 year group there is a correspondingly small proportion in the 50 year and over group. Examples of this relationship are shown in the following table of the populations of 20 countries.

Country	Year	Percentage of living population aged		
		0-14 yrs	15-49 yrs	50+ yrs
Brazil	1910	42.7	48.3	8.0
Cuba	1910	42.3	47.5	10.1
Turkey	1911	42.3	45.5	11.1
India (excluding some provinces)	1911	39.0	50.4	0.7
Mexico	1910	39.2	49.2	10.6
Chile	1910	37.2	51.2	11.5
U. S. R. (including Asiatic territories)	1916	37.2	49.0	13.1
Japan	1910	36.7	45.1	18.1
Greece	1918	3.1	99.0	17.0
Canada	1911	31.7	57.0	10.6
Union of South Africa (whites only)	1916	31.2	5.5	10.2
Italy	1911	29.7	59.0	10.4
United States of America	1911	21.1	51.1	21.7
Eire	1916	20.3	51.2	28.4
Norway	1910	18.4	51.1	20.5
Australia	1911	17.5	51.1	10.1
Germany (excluding Saar Territory)	1911	24.2	51.0	21.8
Finland and Wales	1917	21.8	53.0	4.9
Ireland	1911	21.9	51.4	25.7
Sweden	1915	22.2	52.4	3.4
Averages		32.9	50.8	17.0

(This table was computed mainly from official census data given in the *Statistical Yearbook of the League of Nations* 1936.)

From this table it is seen that countries with high rates of reproduction, and consequently relatively high proportions of their people in the 0-14 year or pre reproductive phase (such as Brazil, Cuba and Turkey) have but a small proportion of persons over 50 years of age in their populations. On the other hand countries reproducing only sparsely (such as England, France, and Sweden) have a relatively high proportion of old people in the population, but only a low proportion aged 0-14 years.

It has been alleged that man is unique among living things in having a disproportionately long, and from one point of view biologically useless, post reproductive phase in the life cycle. This is not so. Other species are similar to man in this respect. Thus Pearl and Miner (*Mém. Muséum Roy. d'Hist. Nat. de Belgique*, 2 ser., fasc. 3, 1936) showed that the females of a moth (*Acrobasis caryae*, the pecan nut case borer) spend an average of about 25% of their total imaginal life span—which in chronological time lasts only 6 to 8 days on the average—in the post reproductive phase, as compared with 26% as an average for human females.

Senescence and Death—The special problem of the biology of death is the analysis and elucidation of phases (d) and (e) of the life-cycle, senescence and death. As a result of investigations in this special field of general biology certain broad generalizations are now possible. The more important of these will now be discussed.

Time Duration—The time duration of the entire individual life-cycle varies enormously, both between different forms of life, species, genera, families, etc., and also between different individuals belonging to the same species. Thus the maximum duration of life of the rotifer, *Proleis decipiens*, is eight days (Noyes). At the other extreme there are other authentic records of individual reptiles living to as much as 175 years. Among mammals man is, on the average, the longest lived, with the elephant as his nearest competitor for this position.

Zoological Groups—The differences between distinct groups of animals (species, genera, families, etc.) in respect to the length of the life-span stand in no generally valid, orderly relationship to any other broad fact now known in their structure or life history. In spite of many attempts to establish such relationships every one so far suggested has been upset by well known facts of natural history. Thus it has been contended that the duration of an animal's life is correlated with its size, in the sense that the larger the animal the longer its life. But plainly this has no general validity. Men and parrots are smaller than horses, but have life spans of much greater length.

Individual Differences—The differences between individuals of the same species in the duration of their lives are distributed in a lawful and orderly manner, in marked contrast to the apparently haphazard character of the inter group variation in length of life-span just discussed. The individual variation in the duration of life is capable of exact mathematical description, and, indeed, its treatment constitutes a special branch of mathematics, known as actuarial science. It has been shown by R. Pearl and his students that if the life of different animals, such as the rotifer, *Proleis*, the fly, *Drosophila*, various other insects and man, be measured not in absolute time units of years or days, but in terms of a relative unit, namely a hundredth part of the biologically equivalent portions of the life span in the several cases, then the distribution of individual variation in duration of life, or the distribution of mortality in respect to age, or, in short, the life curve, is quantitatively similar in these widely different forms of life almost to the point of identity. This is illustrated in fig. 1.

These facts suggest that the observed differences between individuals in duration of life are primarily the result of inborn differences in their biological constitutions (their structural and functional organizations) and only secondarily to a much smaller degree, the result of the environmental circumstances in which their lives are passed.

Inheritance—This inference is supported by the further fact that the differences between individuals which find expression in varying degrees of longevity, or duration of life, are definitely inherited. It has been proved experimentally by cross breeding long lived and short lived strains of the fruit fly *Drosophila*

FIG. 2.—SHOWING HOW LONGEVITY IS INHERITED AMONG FRUIT FLIES WHEN A LONG LIVED IS CROSSED WITH A SHORT LIVED STOCK.

The first generation of progeny (dotted line F_1) is longer lived than either parent stock and when inbred produces progeny of two kinds (F_2), a short winged which is short lived and a long winged which is long lived. The Mendelian laws of heredity are thus seen to hold in the case of these fruit flies for longevity which is shown to behave like a definitely inheritable quality.

melanogaster (Hyde, Pearl and his students, Parker and Gonzalez). The results of such an experiment are shown in fig. 2.

In the first generation (F_1) from such a cross the progeny exhibit a life curve essentially like that of the long-lived parent stock, but with a slightly greater average duration. If now these F_1 individuals are bred together *inter se* there are produced in the second cross breed generation (F_2) two kinds of individuals, one of which (long-winged) has a life curve like the original long-lived parent stock, while the other (short-winged) resembles in duration of life the original short-lived parent stock. In addition to these experiments along Mendelian lines, it has been shown that there can be isolated from a general population of wild *Drosophila* inbred strains showing definite and permanent innate differences in average longevity. The conclusion that individual differences in life duration are fundamentally an expression of hereditary differences between individuals is firmly established.

The importance of inheritance in determining human longevity has been demonstrated from various different lines of approach. In this field Karl Pearson and Alexander Graham Bell were pioneers. Pearl and Pearl studied intensively the ancestry of 365 persons living at ages of 90 and above about whose six immediate ancestors (2 parents and 4 grandparents) there was complete information. They compared with this group 136 persons chosen at random from the general population, all of whose 6 immediate ancestors were dead, and at known and recorded ages. This comparison group had an average living age of 48.75 years, and contained 29 persons over 60 at the time of observation, 6 over 70, and 1 over 80. The average age of the group was almost 16 years higher than that of the living white population of the United States in 1930.

Fig. 3 shows how the ancestry of the nonagenarian and centenarian group compared with the group of ordinary persons in respect of average longevity.

FIG 3—INFLUENCE OF IMMEDIATE ANCESTORS UPON AVERAGE LONGEVITY

From this diagram it is seen that, on the average, each single immediate ancestor, father, mother, grandfather or grandmother, of the extremely longevous persons of panel A on the left side, was longer lived than the corresponding ancestor of the ordinary persons of panel B on the right side. Thus the fathers of the longevous died at the average age of 72.4 years. This was 12.3 years, or over 20%, older than the average age of the fathers of the panel B folk at the right end of the chart. The central panel, A, B, gives the differences, in absolute numbers of years (upper figures in each set sign) and as percentages of the panel B means, for each category of the six immediate ancestors. The "computed total longevity" figures for the individuals observed in the rectangles at the bottom are the resultants of adding to the mean number of years the A and B individuals had already lived at the time of observation the expectations of life proper to those ages, as given in a standard life table.

From this chart two important results emerge regarding the influence of heredity upon longevity, namely:

(a) People who achieved extreme longevity had immediate ancestors (parents and grandparents) who were, on the average, definitely longer lived than the corresponding ancestors of the general run of the population. This was true without exception for each particular category of immediate ancestors.

(b) This hereditary influence promoting longevity was between two and three times as great relatively for parents as it was for grandparents.

A specific study was made as to how each of the parents of the extremely longevous persons was bred relative to longevity, as compared with the parents of the general run of folk. This led to the results shown in fig 4. In this study an individual who died under 50 years of age was regarded as short lived, one who died between 50 and 69 as average or mediocre in life duration, and one who died at 70 or over as long lived. Fig 4 shows the percentages of the fathers and mothers respectively that had (a) both of their parents long lived (shown by the solid black portion of each bar), (b) one parent long lived and the other mediocre or short lived (shown by the cross-hatched portion of each bar), and (c) neither of their parents long lived (shown by the white portion of each bar).

The picture presented by fig 4 is precise and striking. The nonagenarians and centenarians were produced by parents who were themselves bred out of wholly longevous parentage in more than half of all the cases observed—a markedly higher proportion than that shown by the parents of the general population sample. At the other end of the genetic scale the opposite is true. Fewer than half as many proportionally of the nonagenarians and centenarians as of persons generally were produced by parents who themselves had no longevous parentage whatever. There can be no question or doubt that breeding was of great importance in the production of these nonagenarians and centenarians.

Actual studies have also demonstrated the importance of heredity in the achievement of long life. This fact has been equally established by life tables for parents of children who died at specified ages, and by life tables of children of parents having specified degrees of longevity. For example such studies have shown that the mean-after-lifetime of fathers of children dying (or living) at ages of 80 and over is about 26% greater

at age 20, 43% greater at age 40, 75% greater at age 60, and 58% greater at age 80, than the mean-after-lifetime at the same ages of fathers of children dying under 5. The corresponding excesses in expectation of life of mothers were 27% at age 20, 27% at age 40, 36% at age 60, and 23% at age 80. Throughout the whole life-span the parents of the very long lived children appear to be persons of superior biological constitution, as evidenced by their ability to keep on living.

Similar studies have shown that the sons of fathers dying (or living) at ages of 80 years and over have a mean after-lifetime about 13% greater at birth than that of the sons of fathers dying between 50 and 79 years of age, and 22% greater than that of sons of fathers dying under 50 years of age.

Further evidence for the innate constitutional superiority of the longevous was afforded by Pearl's and Raenkhim's (*Human Biology*, vol. 4, 1932) analysis of the causes of death of nonagenarians on the basis of the official records of the Census Bureau. That analysis led to the conclusion that nonagenarians are a selected lot of people. They are the ultimate survivors after all the rest of mankind has gone, unable to meet the vicissitudes of life and keep on living. Nonagenarians and centenarians come to be such because they have organically superior constitutions, resistant to infections, soundly organized to function efficiently as a whole organism and keep on doing it for a very long time. Observations on mortality at ages have indicated that throughout life infections and other harmful environmental forces were, on the whole, tending to take off the weaker and leave the stronger. Medical knowledge and skill, improved sanitation and better conditions of life generally have been able to prevent an increasingly larger amount of premature mortality before age 50. Especially have these agencies been able to reduce the lethal effects of infections, or at least to postpone to a later part of the life span their fatal action. But ultimately there is left a group of extremely old people, for whom on the whole infections have no particular terrors. In all the early part of their lives they have been able successfully to resist infections, and to a remarkable degree still are in extreme old age. These people eventually die. But a great many of them die, not because the novous forces of the environment kill them, but because their vital machinery literally breaks down, and particularly that important part of it—the circulatory system.

Natural Death a Novelty—Neither senescence nor natural death is a necessary, inevitable consequence or attribute of life. Natural death is biologically a relatively new thing, which made its appearance only after living organisms had advanced a long way on the path of evolution. The evidence supporting this conclusion is manifold, and may be considered under several heads: (a) Various single-celled organisms (Protozoa, *q.v.*) prove, under critical experimental observation, to be, in a certain sense, immortal. They reproduce by simple fission of the body, one individual becoming two, and leaving behind in the process nothing corresponding to a corpse. The brilliant work of Woodruff and his students, in particular, has demonstrated that this process may

FIG 4—THE PERCENTAGE DISTRIBUTION RELATIVE TO THE NATURE OF THE PARENTAL MATINGS PRODUCING THEM OF THE FATHERS AND OF THE MOTHERS OF (A) AN EXTREMELY LONGEVIOUS GROUP (NONAGENARIANS AND CENTENARIANS) AND (B) A SAMPLE OF PEOPLE GENERALLY

go on indefinitely, without any permanent slacking of the rate of cell division corresponding to senescence, and without the intervention of a rejuvenating process such as conjugation or endomixis, providing the environment of the cells is kept favourable (b) The germ cells of all sexually differentiated organisms are, in a similar sense, immortal. Reduced to a formula we may say that the fertilized ovum (united germ cells) produces a soma and more germ cells. The soma eventually dies. Some of the germ cells prior to that event produce somata and germ cells, and so on in a continuous cycle which has never yet ended since the appearance of multicellular organisms on the earth (c) In some of the most lowly organized groups of many celled animals or *Metazoa*, the power of multiplication by simple fission, or budding off of a portion of the body which reproduces the whole, is retained. This asexual, or agamic, mode of reproduction occurs as the usual, but not exclusive, method in the three lowest groups of multicellular animals, the sponges, flatworms and coelenterates. More rarely it may occur in other of the lower invertebrates.

So long as reproduction goes on in this way in these multicellular forms there is no place for death. In the passage from one generation to the next no residue is left behind. Agamic reproduction and its associated absence of death also occur commonly in plants. Budding and propagation by cuttings are the usual forms in which it is seen. The somatic cells have the capacity of continuing multiplication and life for an indefinite duration of time, so long as they are not accidentally caught in the breakdown and death of the whole individual in which they are at the moment located.

(d) There is some evidence that in certain fish there is no occurrence of senility or natural death, but that instead the animal keeps on growing indefinitely, and would be immortal except for accidental death. The animal soma in such cases behaves like the root stock of a perennial plant. (For further discussion of this line of evidence see interesting correspondence by C. P. Bidder, in *Nature*, vol. LXX, 1925, *passim*, and M. A. C. Hinton's monograph of the *Voies and Lameurs* [British Museum, 1926], in which it is concluded that voles of the genus *Arvicola* "are animals that never stop growing and never grow old.") (e) The successful cultivation *in vitro* of the tissues of higher vertebrates, even including man himself, over an indefinitely long period of time, demonstrates that senescence and natural death are in no sense necessary concomitants of cellular life. Carrel and Ebeling, by transferring the culture at frequent intervals into fresh nutrient medium, have kept alive and in perfectly normal and healthy condition, a culture of tissue (see *Tissue Culture*) from the heart of a chick embryo for more than 25 years, i.e., for much longer than the normal life-span of the fowl. There is every reason to suppose that, by the continuation of the same technique, the culture can be kept alive indefinitely. The experimental culture of cells and tissues *in vitro* has now covered practically all of the essential tissue elements of the metazoan body, even including some of the most highly differentiated of those tissues. Nerve cells, muscle cells, heart muscle cells, spleen cells, connective tissue cells, epithelial cells from various locations in the body, kidney cells and others have all been successfully cultivated *in vitro*.

Potential Immortality.—It may fairly be said that the potential immortality of all essential cellular elements of the body either has been fully demonstrated, or has been earned far enough to make the probability very great, that properly conducted experiments would demonstrate the continuance of the life of these cells in culture to any indefinite extent. It is not to be expected, of course that such tissues as hair or nails would be capable of independent life, but these are essentially unimportant tissues in the animal economy, as compared with those of the heart, the nervous system, the kidneys, etc. Generalizing from results of tissue culture work of the last three decades, it is highly probable that all the essential tissues of the metazoan body are potentially immortal, when placed separately under such conditions as to supply appropriate food in the right amount, and to remove promptly the deleterious products of metabolism.

Death Among Multicellular Animals.—A fundamental reason why the higher multicellular animals do not live forever appears to be that in the differentiation and specialization of function of cells and tissues in the body as a whole, any individual part does not find the conditions necessary for its continued existence. In the body any part is dependent for the necessities of its existence, as for example nutritive material, upon other parts, or put in another way, upon the organization of the body as a whole. It is the differentiation and specialization of function of the functionally dependent aggregate of cells and tissues which constitute the metazoan body that brings about death, and not any inherent or inevitable mortal process in the individual cells themselves.

When cells show characteristic senescent changes it is perhaps because they are reflecting, in their morphology and physiology, a consequence of their mutually dependent association in the body as a whole,

	Deaths due primarily to organic breakdown or failure of	Mean age at death (years)		Median age at death (years)	
		Male	Female	Male	Female
1	Alimentary tract and associated organs of digestion	25 54 ± 06	28 44 ± 07	14 08 ± 08	14 93 ± 09
2	Respiratory system	32 24 ± 05	32 57 ± 06	31 89 ± 07	32 24 ± 08
3	Skeletal and muscular system	35 09 ± 29	37 90 ± 32	33 02 ± 36	35 96 ± 41
4	Endocrinal system	44 17 ± 82	44 15 ± 36	45 45 ± 103	43 42 ± 46
5	Skin	46 73 ± 34	44 45 ± 49	53 47 ± 43	48 96 ± 59
6	Sexual system	47 37 ± 32	42 47 ± 08	57 06 ± 49	49 38 ± 11
7	Nervous system	49 11 ± 08	51 56 ± 09	54 61 ± 10	60 29 ± 12
8	Circulatory system and blood	54 50 ± 07	54 25 ± 08	62 04 ± 09	62 14 ± 09
9	Excretory system (kidneys and associated organs)	57 94 ± 07	14 24 ± 09	61 37 ± 09	57 50 ± 11

and not any necessary progressive process inherent in themselves. In other words, in the light of present knowledge, it seems necessary to regard senescence, in part at least, as a phenomenon of the multicellular body as a whole resulting from the fact that it is a differentiated and integrated morphologic and dynamic organization. This phenomenon is reflected morphologically in the component cells. But it apparently does not primarily originate in any particular cell because of the fact that the cell is old in time, or because that cell in and of itself has been alive, nor does it occur in the cells when they are removed from the mutually dependent relationship of the organized body as a whole and given appropriate physico-chemical conditions. In short, senescence appears not to be a primary or necessary attribute to the physiological economy of individual cells as such, but rather of the body as a whole.

Times of Death.—The different organ-systems of the body have characteristic times of breaking down and leading to death. These differences probably represent in considerable part different innate degrees of organic fitness of the different tissues and organs, and also in part the degree of exposure of the different organ-systems to environmental stresses and strains. The table above based upon mortality returns of the U.S. Registration Area in 1910, illustrates these differences. The figures tabulated are (a) the mean or average age at death, and (b) the median age at death (that is, the age so chosen that the same number of deaths occur below this age as the number occurring above it).

There are thus wide differences in the time of breakdown of the dif-

FIG 5.—THE TRENDS AT FOUR ADULT AGE PERIODS FROM AGE 20 TO 24 ON TO THE END OF THE LIFE SPAN OF MORTALITY HAVING ITS PATHOLOGICAL LESIONS AND/OR CLINICAL MANIFESTATIONS ASSOCIATED WITH (A) ORGAN SYSTEMS NORMALLY IN DIRECT CONTACT WITH THE EXTERNAL ENVIRONMENT (PLUS EXTERNAL CAUSES EXCEPT SUICIDE), AND (B) ORGAN SYSTEMS NORMALLY NOT IN DIRECT CONTACT WITH THE EXTERNAL ENVIRONMENT (PLUS SENILITY).

ferent organ systems, as reflected in mortality. The alimentary tract, on the average, "wears" rather less than half as long as the excretory system.

The structural and functional organization of the vertebrate body is such that certain organ systems come normally and regularly into direct and immediate contact with the external environment, while other organ systems do not but are on the contrary, protected from such contact. On this basis the organ systems may be classified as follows:

A	B
Organ systems coming into direct contact with the external environment	Organ systems not coming into direct contact with the external environment
Respiratory system	Circulatory system
Sex organs	Skeletal and muscular system
Kidney- and associated excretory organs	Nervous system
Alimentary tract	Endocrine system
Skin	

The mortality of white persons in the U S Registration Area, during the five-year period 1923-27 inclusive has been subsumed under this A (unprotected) and B (protected) classification of organ systems by Pearl and Raenkhams, with the results shown in fig. 5.

It is seen from this diagram that, with advancing adult age the proportion of deaths due to causes having their pathological lesions or clinical manifestations associated with the organ systems of the body which are normally and regularly in direct contact with the external environment (Class A mortality) decreased, while the proportion having their pathological lesions or clinical manifestations associated with the organ systems normally protected from direct contact with the external environment (Class B mortality) increased.

Death and the Environment—It is a plain fact of experience that the environmental circumstances surrounding an organism may, in varying degrees, condition its duration of life. Thus complete starvation can induce death in a much shorter time than would have occurred in the absence of starvation. Similarly, there are many poisons that are lethal in appropriate doses. But, quite apart from such extreme and violent agents, the effect upon longevity of the never-ceasing changes in the normal environment is a matter of the first importance in reaching an understanding of the biology of death. The vast literature embodying the results of modern studies on nutrition and diet has shown, directly and indirectly, the role played by this factor in influencing life duration. Research in the field of nutrition has shown that qualitatively the diet of each particular kind of living organism must contain certain chemical elements and compounds in adequate amounts and proportions if life is to continue. Only within very narrow limits can there be any substitutions for these essentials. In some cases the requirements are absolutely rigid and obligatory. Clinical experience and investigation has shown that quantitatively there are limitations to the amount of food intake if the maximum potential longevity is to be realized. Too much food can shorten life as well as too little. The studies of Curt P. Richter have indicated that the normal upbrought of animals lower in the evolutionary scale than man is a highly effective regulatory governor of food intake, as regards both quality and quantity. Rats given a free choice of chemically pure food elements tend to make for themselves a diet that is physiologically optimal.

In many critical studies by appropriate statistical and actuarial methods have thrown light upon the relation between longevity and certain widespread environmental circumstances. Evidence has been accumulated to show, for example, that the moderate consumption of alcoholic beverages is not significantly associated statistically with differences

cycle, could be prolonged up to as much as 6 to 7 times the normal expectation for the amount of food available. Furthermore the amount of growth, however measured, was increased as compared with the normal for the same amount of available food. Other experimental studies on various lower animals have shown that partial starvation markedly increased the duration of life.

Senescence—Many theories of senescence have been advanced. No one of them can be regarded as entirely satisfactory or as generally established by the evidence. Most of them suffer from the logical defect of setting up some particular observed attribute or element of the phenomenon of senescence itself, such as protoplasmic changes, slowing rate of metabolism (minus, essentially only reduced activity), etc., as the cause of the whole. More experimental work on the problem is essential, in particular in the direction of producing, if will and under control, the objective phenomenon of senescence in respect of the age of the organism, and conversely preventing the appearance of the phenomena in old animals.

Bibliography—The literature on the subjects treated in this article is widely scattered in biological, medical and statistical journals and separate treatises. The following books summarize the field: C. M. Child, *Senescence and Rejuvenescence* (1915), E. Korschelt, *Lebensdauer, Alter und Tod* (1922), R. Pearl, *The Biology of Death* (1922), T. B. Raftery, *Robertson The Chemical Basis of Growth and Senescence* (1923), R. Pearl, *Studies in Human Biology* (1924), *The Rate of Living* (1928), R. Pearl and Ruth D. Pearl, *The Ancestry of the Long-lived* (1934), L. I. Dublin and A. J. Lotka, *Length of Life. A Study of the Life Table* (1936), Louis I. Dublin and H. H. Marks, "Inheritance of Longevity," *Reports, Association of Life Insurance Medical Directors* (Oct. 1941), E. V. Cowdry (Editor), *Problems of Medical Biology and Medical Aspects* (1942) (R. P.).

DEATH RATE Since communities vary in numbers of population, it is the practice to compare their death statistics in the form of death rates per 1,000 of population. Thus there were 1,444,337 deaths reported in the U S during 1948, since the population for that year was estimated to have been 146,113,000 (excluding armed forces overseas), the death rate was 9.9 per 1,000 of population. In England and Wales, the death rate in 1948 was 10.8 per 1,000 of population. The death rate computed simply as the ratio of the total deaths in a community within a calendar year to its total population living during the same period is known as the crude annual death rate.

Age, Sex, and Race Incidence—Death rates may be computed specifically for each sex and age, and also for each race living in the community. Thus, among white persons in the United States, the death rate during 1948 was 9.7 per 1,000, while among nonwhites it was appreciably higher, namely 11.3 per 1,000. The death rate among males is higher than that among females in most countries of the western world. For example, in the United States during 1948 there were 11.2 white male deaths per 1,000 white males living while the figure for white females was 8.3 per 1,000. The corresponding death rates in England and Wales for 1947 were 13.6 per 1,000 males and 11.3 per 1,000 females.

When the number of deaths occurring at a specific age within a calendar year is divided by the number living at that age, the result obtained is an annual age specific death rate. There is a

TABLE I—Average Annual Death Rates per 1,000 Total Population in Certain Countries for the Period 1916 to 1948

Country	Death rate per 1,000	Country	Death rate per 1,000

*Average for 1945 and 1946. †Average for 1916 and 1917. 1946 only.

rates are standardized. The standardized death rate of a community is the death rate which would prevail in the community if its population had the age distribution of some suitably selected standard population. The actual operation of computing a standardized death rate consists in (1) multiplying the age-specific death rates of the community by the number of persons at corresponding ages in the standard population, (2) summing the resulting products for all ages, (3) dividing the sum so obtained by the total population of the standard. The result is the standardized death rate. The process may be extended to standardize death rates for variations in the sex and colour constitution of communities. Standardized death rates are not always available and it accordingly becomes necessary to make mental allowance for the extraneous effects of age, sex and racial composition of communities whose crude death rates are being compared.

International Comparisons.—The death rates of the United States and of England and Wales compare very favourably with those for most countries of the world. Among the few countries with lower death rates during the period 1946-48 were Canada, with a death rate of 9.4 per 1,000, Denmark, 9.5, the Netherlands, 8.0, Norway, 9.1, Australia, 9.9, and New Zealand, 9.4. The following countries, among others, experienced death rates of 15 per 1,000 or more: Mexico, 17.3, Chile, 17.1, British India, 17.5, and Ceylon, 16.6. In addition to these countries, there are many others with poor health conditions which do not compile their death statistics. The foregoing death rates, and those for several other countries, are shown in Table I.

Trend.—There has been a steady decrease in the death rate in

TABLE II—Average Annual Death Rates per 1,000 Total Population in Selected Countries for Specified Periods and Years from 1951 to 1948

Period or Year	United States	Canada	England and Wales	France	Germany	Italy	Sweden
1851-60	*	*	23.3	24.0	26.4	*	21.7
1901-10	*	*	22.5	21.7	26.9	*	20.2

*Not available. †French zone.

most western countries since about the middle of the 19th century, the improvement has been particularly marked since 1900 (see Table II). Thus, in England and Wales, the crude death rate from 1851 to 1870 was, on the average, somewhat more than 22 per 1,000, while during the decade 1901-1910 it averaged 16.9 per 1,000. The downward movement continued to a low of 10.8 per 1,000 in 1948. In the United States, the death rates per 1,000 fell from an average of 15.7 during 1901-10 to a record low of 9.7 in 1949. France experienced a decline in the death rate from a level of about 24 per 1,000 during 1851-80 to only 12.2 in 1948. In Germany, the drop was from about 27 per 1,000 during 1851-80 to a level of about 12 per 1,000 after 1946. A more accurate picture of changes in mortality conditions with lapse of time may be obtained from a comparison of age-specific death rates. A comparison of this kind inevitably shows that the greatest relative improvements were at the youngest ages, while relatively little change in death rate had taken place at the older ages. Thus, in the United States the death rate in the first year of life in 1901 was 124 per 1,000, while in 1948 it was only a little less than 32 per 1,000. At age 20, the death rates per 1,000 were 5.89 in 1901 and 1.49 in 1948, while at age 50 they were 14.59 and 9.33 respectively, at age 70, the corresponding figures were 56.41 and 45.40.

Marital Status.—When marital status is taken into consideration, it is usual to find, in western countries, that the death rates are lowest among the married and highest for the widowed and divorced, while those for the single fall in between. An exception to this general situation is found at the early childbearing ages where the risks of maternity among married women are sufficient to bring their death rate to a level about that for the single widowed or divorced women of the same ages. The lower death rates of the married as compared to those of the single at the same ages may be ascribed in part to the stabilizing influence of marriage, which is conducive to longevity, but also in part to the fact that persons in indifferent health may thereby be deterred from marrying. Death rates per 1,000 for the United States, 1940, typify the differentials according to marital status: at ages 20 to 24 the rate for married white women was 1.7 and that for the single women was 1.5, at 45 to 54 the rates were 7.0 for the married, 7.9 for the single and 9.3 for the widowed. Among white men, the death rates per 1,000 at ages 25 to 34 were 2.2 for the married and 4.0 for the single, at 45 to 54 they were 9.8 for the married, 16.2 for the single and 19.2 for the widowed.

Occupation.—There is a distinct gradation in the death rates in passing from the lowest to the highest social economic classes of a community. In a study based upon the United States census of 1930 and death statistics for ten states during that year, it was found that the death rates per 1,000 males between the ages 15 to 64 years in the several social economic classes were as follows: unskilled workers, 13.1, semiskilled workers, 9.9, skilled workers, 8.1, clerks, proprietors, managers and officials, 7.4, professional men, 6.0, and agricultural workers, 6.2 per 1,000. There is evidence that variation in death rates of men according to social-economic class arises primarily from the environment associated with their occupation and that the occupational risks involved have only a relatively small influence.

Causes of Death.—Death rates may also be computed according to the cause of death. Thus, the death rates for the ten leading causes of death per 100,000 total persons in the United States during 1948 were, in order of rank: heart disease, 323, cancer, 135, cerebral haemorrhage, 90, accidents, 67, diseases of early infancy and congenital malformations, 55, nephritis, 35, pneumonia and influenza, 39, tuberculosis, 30, diabetes mellitus, 26, and arteriosclerosis, 19. These ten causes accounted for 85% of the deaths for all causes.

There were striking changes in the death rates for certain causes of death in the United States after 1900. For example, the death rate for typhoid fever was 36 per 100,000 in 1900, but only 0.2 per 100,000 in 1948. For tuberculosis, the decline was from 201 to 30 for the corresponding period, in the case of diarrhoea and enteritis the death rate dropped from 133 to 6.

TABLE III—Average Length of Life in Certain Countries

Country	Period	Average length of life—years		Country	Period	Average length of life—years	
		Males	Female			Males	Female

Preventive measures had practically eliminated diphtheria as a cause of death, its death rate fell from 43 in 1900 to 0.4 in 1948. On the other hand, many important causes of death had shown increases in their rates. Mortality from heart disease in 1948 was about 2½ times that in 1900. The death rate for cancer rose from 63 per 100,000 in 1900 to 135 in 1948. A large part of the increase in the death rates for heart disease and cancer may be attributed to the increase in proportion of older persons in the population and to improvement in diagnosis. The death rate per 100,000 from diabetes mellitus rose gradually from 10 in 1900 to 26 in 1948. Deaths from automobile accidents claimed 22 out of every 100,000 persons in 1948.

Average Length of Life—The average length of life, which is also known as the expectation of life at birth, is the number of years the average newly born baby may expect to live if the age-specific death rates remain constant as of the calendar year or period for which the figure is computed. The average length of life thus provides a composite measure of the age-specific death rates of a community independent of its age distribution. The superiority of this figure, over the standardized death rate, as a composite measure lies in the fact that it is independent of any arbitrarily chosen age distribution used as a standard.

The average length of life for white persons in the United States is much the same as that for England and Wales. In 1948, white males in the United States had an average length of life of 65.49 years and white females of 71.04 years. The corresponding figures for England and Wales in 1937, the latest year available, were 65.18 years for males and 64.40 years for females. For other countries see Table III.

DEATH VALLEY, a depressed basin in Inyo county, Calif. The name commemorates the fate of a party of "forty-milers" who perished here, by thirst or by starvation and exposure. The exceedingly arid Death valley region lies immediately north of the Mohave desert and then stretches east from the Sierra Nevada, covering a large part of Inyo county and extending into Nevada.

The valley proper, which is some 50 mi long and on an average 20 to 25 mi broad from the crests of the enclosing mountain ranges, is below sea level and at its lowest point is 282 ft below sea level. This is the lowest point on the continent and in a direct line it is less than 80 mi E of Mt. Whitney, 14,493 ft high,

the highest peak in the U.S. The mountains about it are high and bare, and brilliant with varied colours.

The Amargosa river, entering the valley through a deep canyon at the south, disappears in the basin, leaving the surface crusted with white salts. The fact that this limited region is the final area of concentration for a very extensive drainage system is thought to explain the extent and supposed depth of the deposits of salt, borax and nitrate of soda found in the basin.

Death valley is one of the hottest regions in the world. The minimum daily temperature in summer is rarely below 70° F (in the shade), the maximum may, for days in succession, be as high as 120°, and the U.S. weather bureau has recorded an extreme of 134°.

See W. C. Mendenhall, "Some Desert Watering Places in Southeastern California and Southwestern Nevada," U.S. Geological Survey Water Supply Paper No. 224.

DEATH WARNING, a term used in psychical research for an intimation of the death of another person received by other than the ordinary sensory channels, i.e., by (1) a sensory hallucination or (2) a massive sensation, both being of telepathic origin. (See TELEPATHY.)

Both among civilized and uncivilized peoples there is a widespread belief that the apparition of a living person is an omen of death.

DEATHWATCH, a popular name given to insects of two distinct families which burrow and live in old furniture, and produce a mysterious ticking sound vulgarly supposed to foretell the death of an inmate of the house. The name is often applied to two small beetles *Xestobium rufovillosum* and *Anobium punctatum* (family Anobiidae) but belongs more properly to the former insect. The sound is a sexual call and is produced by the beetle striking the front of the head upon the surface on which it is standing.

Certain book-lice (order Psocoptera) are sometimes known as lesser deathwatches, but the ability of such minute soft insects to produce audible sound is doubtful. The names *Atropos pulsatoria* and *Troctes divinatorius*, given to two of the common species, bear witness to the superstition regarding the fateful significance of the sound.

DE BARY, HEINRICH ANTON (1831-1888), German botanist, was born on Jan. 26, 1831, at Frankfurt-on-Main. He studied medicine at Heidelberg, Marburg and Berlin, and in 1853 settled at Frankfurt as a surgeon. In 1854 he became Privatdozent for botany in Tübingen, and professor at Freiburg in 1855, migrating to Halle in 1867, and in 1872 to Strasbourg, where he was the first rector of the university, and where he died on Jan. 19, 1888.

Although one of his largest and most important works was on the *Comparative Anatomy of Ferns and Phanerogams* (1877), and notwithstanding his admirable acquaintance with systematic and field botany generally, de Bary will always be remembered as the founder of modern mycology.

This branch of botany he completely revolutionized in 1866 by the publication of his celebrated *Morphologie und Physiologie der Pilze*, etc., a classic which he rewrote in 1884, and which had a world-wide influence on biology. His clear appreciation of the real significance of symbiosis and the dual nature of lichens is one of his most striking achievements, and in many ways he showed powers of generalizing in regard to the evolution of organisms, which alone would have made him a distinguished man.

It was as an investigator of the then mysterious fungi, however, that de Bary stands out first and foremost among the biologists of the 19th century. He not only laid bare the complex facts of the life-history of many forms—*S. g.*, the Ustilagineae, Peronosporae, Uredineae and many Ascomycetes—treating them from the developmental point of view, in opposition to the then prevailing anatomical method, but he insisted on the necessity of tracing the evolution of each organism from spore to spore, and by his methods of culture and accurate observation brought to light numerous facts previously undreamt of.

One of de Bary's most fruitful discoveries was the true meaning of infection as a morphological and physiological process, which he traced in *Phytophthora*, *Cystopus*, *Puccinia* and other

Fungi, and thereby demonstrated the significance of parasitism. He showed wherein lay the essential differences between a parasite and a saprophyte.

These researches led to the explanation of epidemic diseases, de Bary's contributions to which are well seen in his classical work on the potato disease in 1861. They also led to his discovery of *heterocism* (or *metocism*) in the Uredineae, the truth of which he demonstrated in wheat rust experimentally (1863). He described the phenomena of sexuality in Peronosporae and Ascomycetes—*Eurotium*, *Erysiphe*, *Peizia*, etc., and established the existence of parthenogenesis and agamy on a firm basis. He did much work on the Chytridiaceae, Ustilagineae, Exoascaceae and Phalloideae, as well as on the Myxomycetes, he contributed to algology in his monograph on the Conjugatae (1858) and investigated Nostocaceae (1863), *Chara* (1871), *Acetabularia* (1869), etc. In 1877 appeared his *Comparative Anatomy of Ferns and Phanerogams* (Eng trans 1884), and in 1885 his *Lectures on Bacteria* (Eng trans 1887).

Memories of de Bary's life will be found in *Bot. Centraltbl.* (1888), xxiv, 93, by Wilhelm, *Ber. d. d. bot. Ges.* vol vi (1888) p. viii, by Rees, each with a list of his works, *Bot. Zeitung* (1886), vol. xiv, no. 3, by Graf zu Solms-Laubach, *Allg. Deutsch. Biogr.* xvi (1902).

DEBENTURES AND DEBENTURE STOCK. see COMPANY LAW

DEBORAH, the name of two women mentioned in the Old Testament (Heb. for "bee") (1) Foster mother of Rebecca, buried under the "Oak of Weeping" below Bethel (Gen. xxxv, 8). It has been suggested that this tree is connected with the "palm-tree of Deborah," between Bethel and Ramah (Judges iv, 5), the home of Deborah. (2) This latter is the famous prophetess and "judge," who, in company with Barak, son of Abinoam, delivered Israel from a Canaanite oppression.

Two narratives of this exploit have been preserved, an account in prose in Judges iv, and a descriptive poem in Judges v. They differ in one or two important details. The most obvious contrast is in the identity of the enemy overthrow. The prose narrative makes the enemy Jabin, king of Hazor, though a prominent part is played by his commander-in-chief, Sisera, who lived at Harosheth gogoyim. In the poem Jabin does not appear, and Sisera is an independent king. It is possible that the introduction of Jabin is due to the conflation of two traditions, one of which referred to Sisera, while the other was parallel to the story of the defeat of Jabin, king of Hazor, by Joshua (Josh. xi, 1-9) at the Waters of Merom. Another contradiction is to be found in the manner of Sisera's death. In Judges ch. iv he is murdered in his sleep, in ch. v he is struck down from behind whilst drinking a bowl of milk.

Assuming that the tradition preserved in ch. v is the older, we can do something to reconstruct the actual history of the events. Israel holds the wilder parts of the country, the hills and the forests, but their settlements in the central range are cut off from those in the northern hills by a chain of Canaanite (Egyptian?) fortresses down the plain of Esdraelon. For the time the plain dominates the hills, the Israelites are disarmed and their communications are cut. At the instigation of the prophetess Deborah, and possibly aided by her spells, Barak raises the clans of Ephraim, Benjamin, Machir (Manasseh), Zebulun, Issachar and Naphtali. Asher, Dan, Gilead (Gad) and Reuben hold aloof. Judah and Simeon are not mentioned. The Israelite clans fall on the enemy at Taanach, a thunderstorm, in which Israel sees the coming of Yahweh, strikes terror into the Canaanites, their chariots are useless on the sodden ground, and the Kishon swollen by torrential rains, sweeps away the fugitives. Sisera escapes on foot, pursued by Barak, but, taking refuge in the tent of Heber the Kenite, is treacherously slaughtered as he drinks.

The poem is one of the most important documents of ancient times. It is contemporary with the events to which it refers, and is therefore invaluable as a picture of the life of Israel in the early days of the settlement. Further, it is in itself a magnificent lyric outburst, and proves a very high standard of poetic skill in ancient Israel.

BIBLIOGRAPHY.—For fuller details see G. A. Cooke, *History and Song of Deborah* (1892), the commentaries on Judges and the his-

stories of Israel. Paton (*Syria and Palestine*, pp. 158 sqq.) suggests that the battle was against the Hittites (Sisera, a successor of Shalmaneser). See also L. W. Batten, *Journ. Bibl. Lit.* pp. 31-40 (1905), who regards Judges v and Josh. xi as duplicates, Winckler, *Gesch. Israels*, ii, 125-135, *Kehnscher u. d. Alte Test.* 3rd ed., p. 218, and Ed Meyer, *Israeliten*, pp. 272 sqq., 487 sqq., also Burney, *Judges*, ad loc. Eissfeldt, *Die Quellen des Richterbuches*, pp. 22, 23. (T. H. R.)

DE BOSIS, ADOLFO (1865-1924), Italian poet and man of letters, was born at Ancona. He studied at the University of Rome, where he graduated in law and practised for a few years, but was always more interested in literature. In 1895 he became editor of *Il Convitto*.

Although De Bosis became manager of the Italian Carbide company, he continued his literary activities. He translated Shelley's "Prometheus Unbound" (1922) and Homer into Italian verse. He collected his own poems in a volume entitled *Amori ac silentio sacrum* (1900, rep. 1914, 1923).

De Bosis exercised considerable influence on the younger authors of his time, many of whom were inspired by his deep love of the classics and keen sense of beauty. He died near Ancona on Aug. 29, 1924.

DEBRECEN, one of the largest towns in Hungary (pop. 1939, 128,442), is at the junction of three contrasted regions, viz. the extensive Hortobagy pastures or *pusta*, the Nyirseg sandy plateau and the marshes of the Berettyó. In early times it commanded two important routes, the salt way from Szatmar to western Europe and the road from Bohemia to Transylvania, both traversed by important trade movements in the mediaeval period, it is still an important railway junction. It developed as a market centre with special interests in cattle and grain and as a walled town attracted numerous refugees from surrounding plundered villages during the Turkish advance in the 15th century. Partly as a result of this the municipality acquired large areas of territory until it covered an area of nearly 400 sqm. Much of this was cultivated by farmers who maintained houses and often worked in the town during the winter season but of recent years villages known as *tanyas* have grown up in the surrounding district.

The town tends more and more to function as the centre of economic and intellectual inspiration for its region through its fairs, its agricultural academy, its well equipped university and its long tradition of spiritual independence which has made it the focus of Protestant ideals in Hungary and gained for it the name of "Calvinistic Rome." This outlook first determined in the 16th century has caused a stormy history but strengthened its position in the national structure.

Apart from its agricultural activities many varied industries have developed upon a small and local scale, notably the manufacture of soap, prepared foodstuffs and tobacco.

DEBS, EUGENE VICTOR (1855-1926), American Socialist leader, was born at Terre Haute, Ind., on Nov. 5, 1855. On leaving the public schools he became in 1871 a locomotive fireman. In 1879 he was elected city clerk of Terre Haute and in 1881 was re-elected. During 1886 he was a member of the Indiana legislature. Previous to this, in 1880, he was elected secretary and treasurer of the Brotherhood of Locomotive Firemen and was appointed editor of *The Locomotive Firemen's Magazine*. In 1893 he organized the American Railway union and was elected president of the union, serving four years. In 1894 he led the strike which, beginning in the Pullman-car plants, soon involved the railways leading into Chicago.

Debs was arrested on a charge of conspiracy to kill, and acquitted, but was later convicted of contempt of court for violating an injunction, and sent to jail for six months (May-Nov. 1895). In 1897 he joined the Socialist movement. He was Socialist candidate for the presidency of the United States in 1900, 1904, 1908, 1912 but declined the nomination in 1916. In 1907 he was on the editorial staff of the *Appeal to Reason*, and in 1914 became editor-in-chief of the *National Rye-Saw*, a Socialist paper published at St. Louis. He was an advocate of industrial unionism, though he eventually dissociated himself from the Industrial Workers of the World (I.W.O.), and was one of the chief opponents of Samuel Gompers (I.W.O.).

He was a pacifist and in Sept. 1918 was convicted of violating the Espionage Act and sentenced to ten years in the penitentiary. In 1920, while in prison, he was again nominated president; it can date by the Socialists and received 915,300 votes. His sentence was commuted by President Harding in Dec. 1921. He died at Elmhurst, Ill., Oct. 19, 1926. He was one of the foremost figures in American Socialism.

He was the author of *Liberty* (1895), *Unionism and Socialism, a Plea for Both* (1904), *The American Movement* (1901), *Industrial Unionism* (1905), *The Growth of Socialism* (1910), *The Children of the Poor* (1911), and *Walls and Bars* (1927). Also see Stephen Marion Reynolds *Life of Eugene V. Debs* (1910), Max Eastman *The Trial of Eugene V. Debs* (1919), Walter Hurt *Eugene V. Debs: an Introduction* (1919), David Karsner *Debs: His Authorized Life and Letters* (1919), and Scott Nearing, *The Debs' Decision* (1919). Consult also *Debs' Magazine*.

DEBT, a definite sum due by one person to another. Putting aside those created by statute, recoverable by civil process, debts may be divided into three classes: (1) judgment debts (see JUDGMENT DEBTOR), (2) specialty debts, (3) simple contract debts.

As to judgment debts, it is sufficient to say that, when by the judgment of a court of competent jurisdiction an order is made that a sum of money be paid by one of two parties to another, such a debt is not only enforceable by process of court, but it can be sued upon as if it were an ordinary debt.

A specialty debt is created by deed or instrument under seal. Until 1869 specialty debts had preference under English law over simple contract debts in the event of the bankruptcy or death of the debtor, but this was abolished by the Administration of Estates Act of that year. The main difference now is that a specialty debt may, in general, be created without consideration, as, for example, by a bond under seal, and that a right of action arising out of a specialty debt is not barred if exercised any time within 20 years, whereas a right of action arising out of a simple contract debt is barred unless exercised within six years. (See LIMITATION, STATUTES OF.)

Any other debt than a judgment or specialty debt, whether evidenced by writing or not, is a simple contract debt. There are also certain liabilities or debts which arise from tacit or implied contracts to pay.

At English common law debts and other choses in action were not assignable (see CHOSE), but by the Judicature Act, 1873, any absolute assignment of any debt or other legal chose in action, of which express notice in writing is given to the debtor, trustee or other person from whom the assignor would have been entitled to receive or claim such debt, is effectual in law. The discharge of a debt may take place either by payment of the amount due, by accord and satisfaction, i.e., acceptance of something else in discharge of the liability, by set off (*q.v.*), by release, or under the law of bankruptcy (*q.v.*). It is the duty of a debtor to pay a debt without waiting for any demand, and, unless there is a place appointed either by custom or agreement, he must seek out his creditor for the purpose of paying him unless he is "beyond the seas." Payment by a third person to the creditor is no discharge of a debt, as a general rule, unless the debtor subsequently ratifies the payment.

Imprisonment for debt, the evils of which have been so graphically described by Dickens, was abolished in England by the Debtors Act, 1869, except in cases of default of payment of penalties, default by trustees or solicitors and certain other cases. But in cases where a debt or instalment is in arrear and it is proved to the satisfaction of the court that the person making default either has or has had since the date of the order or judgment the means to pay the sum in respect of which he has made default and has refused or neglected to pay, he may be committed to prison at the discretion of the judge for a period of not more than 42 days. In practice, a period of 21 days is usually the maximum period ordered. Such an imprisonment does not operate as a satisfaction or extinguishment of the debt, and no second order of commitment can be made against him for the same debt, although where the court has made an order or judg-

ment for the payment of the debt by instalments a power of committal arises on default of payment of each instalment. In Ireland imprisonment for debt was abolished by the Debtors Act, 1880. In France it was abolished in 1867, in Belgium in 1871, in Switzerland and Norway in 1874 and in Italy in 1877. In the United States imprisonment for debt was universal under the common law but it has been abolished in every state except in certain cases as where there is any suspicion of fraud or where the debtor has an intention of removing out of the state to avoid his debts. (See also BANKRUPTCY, CONTRACT, NATIONAL DEBT, PAYMENT.)

In the United States the law is in general as stated above. But the effect of a seal to make consideration unnecessary to the creation of a debt has been very generally abolished by statute, even where not abolished, the effect has commonly been reduced to raising a *prima facie* presumption of consideration. Yet the seal commonly retains its effect of lengthening the period of limitation. The notice of an assignment need not, in the United States, be given to the debtor in writing. And the English rule that payment by a third person will not discharge has either been abolished or rendered substantially null by liberality in construing the slenderest of evidence into "ratification" by the debtor.

Debt, it should be noted, is the legal counterpart of the economic concept "credit" (*q.v.*), and where liquidity of credit is important, debts are commonly put in the form of negotiable instruments, to facilitate transfer. (See BILL OF EXCHANGE.) There is, however, some financing done by merchants transferring their book accounts—though at a heavy discount. (See ASSIGNMENT.)

DEBT CONVERSION In its broadest sense, debt conversion means any exchange of debt instruments for other securities in either private or public finance. In its narrower, more usual meaning it connotes an operation wherein a public body retires one issue of bonds by giving in exchange another issue with terms more favourable to the debtor, typically a lower rate of interest.

Certain other debt operations may be distinguished from conversion. Floating or short-term debt may be exchanged for long term bonds, this is known as *floating* or *consolidation*. When an issue of bonds matures, the debtor government may issue new bonds either for cash or in exchange for the old bonds, this is *refunding*. Following financial difficulties, a local government may agree with its creditors on a composition or plan of readjustment. In the United States such action may follow proceedings under the Municipal Bankruptcy Act. This is known as *readjustment*. While an exchange of bonds may take place in connection with any of the above operations, such an exchange would not be a conversion in the strict sense.

Under certain conditions a special kind of conversion may take place at the option and to the advantage of the bondholder. Near the beginning of a major war a government may find it necessary to sell "convertible" bonds, i.e., bonds which may be converted at the option of the holder into bonds subsequently issued by the government on terms more favourable to purchasers. During World War I Great Britain included such a feature in several issues of war bonds, many of which were later converted into the 5% War Loan. The United States gave wide conversion privileges in the 3½% First Liberty Loan, more restricted privileges in the 4% Second Liberty Loan, and none at all in the 4½% Third and Fourth Liberty Loans. The conversion privilege of the First Liberty Loan was, in part, defeated by reducing the tax exemption of the bonds into which it was convertible. The conversion privilege is likely to be costly and troublesome and may be dangerous if it causes finance officials, in an effort to avoid issuing bonds which would invite conversion, to resort to short-term, inflationary borrowing methods. During World War II neither Great Britain nor the United States used the conversion feature. Both countries did, however, provide a partial substitute for conversion by selling, principally to small purchasers, large amounts of Defense and Savings bonds redeemable at the option of the holder. If it should become profitable to do so, these bonds might be redeemed for

cash and the proceeds used to buy new issues of bonds bearing higher rates of interest.

General Aspects of Conversion.—Government debts are usually represented by bonds or notes which bear interest at a specified rate. Bonds may have a definite maturity date or they may be perpetual. In perpetual bonds the debtor does not promise to repay the principal but does promise to pay interest at the specified rate indefinitely. It is customary to make both types of bonds irredeemable for a certain period of time, known as the period of inconvertibility. After the expiration of that period the debtor government is free to call the bonds for repayment at par or—by special provision—at a small premium.

All voluntary conversions involve only callable bonds and rest upon the fundamental right of a government to repay its debt according to contract. Bondholders are offered an opportunity to exchange their old bonds for new ones bearing a lower rate of interest, the alternative is to accept repayment in cash. A *forced conversion* is one in which the government disregards the period of inconvertibility or does not give bondholders the alternative of repayment. It is an act of sovereignty against which bondholders have no immediate redress. A *compulsory conversion* is one in which all affected bondholders must choose between conversion and repayment as contrasted with one in which they may choose between conversion and retaining their old bonds.

The fundamental purpose of most conversions is to reduce interest costs. Such a reduction is so obviously advantageous to taxpayers that in most English speaking countries, governments consider it not merely a *right* but a *duty* to convert when conditions permit. In some countries, however, bondholder groups have at times been able to prevent conversion on the ground that it would be unfair to creditors. The net gain from conversion will be less than the gross reduction in interest costs for two reasons: first, the government will suffer a reduction in income tax collections from bondholders, and, second, to the extent that bonds are held by governmental agencies, trust funds, etc., the government may have to compensate for the reduction in interest.

A secondary purpose of conversion may be to adjust the schedule of debt maturities. If a large amount of debt is scheduled to mature in one year, refunding operations may be too large to be handled conveniently within the limited time. The load may be lightened by giving some of the bondholders, well in advance of maturity, the opportunity to convert their holdings into bonds with later maturities. Such conversions may or may not reduce interest costs.

It is logical to expect that a government can effect economies by converting its debt in time of peace. The greater part of public debts are incurred in time of war or other great emergencies, when economic conditions are chaotic. Those conditions, plus the large scale of governmental borrowing, usually force a government to pay high interest rates on its loans. If and when the government has weathered the storm and financial stability is restored, government loans can usually be raised on more favourable terms. This, more than any other single factor, explains the gains that may be expected from conversion. The extensive economic and financial controls employed during World War II prevented interest rates from rising and may thus have precluded large gains from conversion in the postwar period.

Before World War I it was customary for governments to have relatively few issues of bonds, each representing a substantial part of the total debt. When one such issue was converted, it was a major financial operation. In Great Britain that condition continued after World War I, but the United States, after 1920, adopted a "flexible debt" policy, *i.e.*, a policy of having many issues of bonds and with their maturities so arranged that a fairly uniform amount of debt would mature each year. Such bond issues are irredeemable during most of their existence and become callable only during the last two to five years before maturity. Because interest rates were declining, the policy was adopted of converting all issues soon after they became callable. The result was a steady flow of relatively small conversions but few that were outstanding.

Great Britain and the United States have resorted to conversion

consistently and as a matter of course whenever conditions have permitted. Generally their conversions have been soundly conceived, carefully planned and smoothly executed. France, on the other hand, has traditionally shown more concern for the interests of bondholders and has been erratic and timid in its use of conversion. In most other European countries no consistent or uniform conversion policy has been developed because of widely varying political and financial conditions.

Principles of Conversion.—From more than two centuries of experience with conversion, certain well defined principles of conversion have been deduced. First, the conversion should be voluntary. Bondholders should always have a choice between converting and accepting repayment. In totalitarian countries with strict economic and financial controls, this principle may be disregarded with impunity, but under liberal capitalism the government which repudiates its covenants or treats its creditors harshly may eventually pay for its action by having to borrow under less favourable terms.

Second, the conversion plan should be simple. Thousands, perhaps millions, of bondholders must make decisions upon which rests the success of the conversion. If several complicated options are presented, decisions will be delayed and many bondholders are likely to request repayment in cash as the simplest alternative.

Third, conversion should be at or near par. If the par value of the new bonds is less than the par of the bonds surrendered, bondholders suffer a loss of capital. Bondholders object to such a loss, even though it be compensated by a higher interest rate. If the par value of the new bonds exceeds the par of the old bonds, the nominal amount of the debt is increased and future conversions are impeded.

Fourth, the new bonds should be convertible for some stated period. Bondholders will be reluctant to accept new bonds if there is a likelihood that the government may convert again in the near future. It is necessary to provide protection against this contingency for a few years. The government, however, should not make this period so long as to impair its opportunity for another conversion after a reasonable time. The length of the period must be a compromise between the conflicting interests of the bondholders and of the government.

Finally, the conversion plan should be carefully prepared and fully publicized. Careful planning will provide for meeting and overcoming contingencies which might be fatal to a hasty or careless plan. Full publicity is necessary to apprise all bondholders of the conversion and to protect them against false representations by buyers who might wish to profit from the conversion.

Conditions of Conversion.—Certain conditions must exist before a conversion is possible. First, the bonds to be converted must be callable. After 1933, states and municipalities of the United States were denied savings of millions of dollars annually in interest because bonds which they had issued between 1920 and 1932, at rates of interest from 4% to 6%, were not callable. Had they been callable, those bonds could have been converted into new ones with interest rates of from 1% to 3%.

A second prerequisite to conversion is a reasonable degree of political stability in the debtor government. The threat of drastic political change with its inevitable uncertainty would usually make bondholders unwilling to accept the less favourable terms which a conversion involves.

A third prerequisite is a decline in prevailing interest rates between the time the bonds were originally issued and the time of the conversion. Under special conditions a government may so improve its financial condition and prospects that the rate of interest at which it can borrow declines even though interest rates generally do not fall.

Before 1930 interest rates were generally regarded as the result of the operation of immutable economic forces. Since that time the realization has been growing that governments, through central banks, trust funds, loan agencies, and other similar institutions, can influence the level of interest rates. In considerable measure, governments can produce interest rates favourable to conversion.

Techniques of Conversion—Several techniques may be employed to speed conversion and to assure its success. The exact time when the operation is announced may be important in gaining public support and in taking advantage of the technical position of the financial markets. Decisions of bondholders may be hastened by allowing only a limited time for the exercise of options and by giving small cash bonuses for prompt conversions. Governments may also gain a substantial advantage by treating all who do not specifically request repayment as having agreed to conversion. In the 1933 conversions, Great Britain allowed holders three months in which to make their choice but gave a cash bonus of 1% to those assenting within 30 days. France allowed only six days for the choice and gave no bonus.

In several ways a government may prepare the market for conversion. In conjunction with the central bank and through regular treasury and trust fund operations, it may reduce interest rates and ease credit conditions generally. It may enlist the support of large holders of bonds, such as banks and insurance companies, and have those institutions publicly announce their decision to convert in the early days of the operation. Finally, the government may ban other issues of new securities for a limited time in order to reduce competition for investors' funds.

The success of conversion will depend to a considerable extent on the terms of the new bonds being offered, the most important of which are the interest rate and the amount of tax exemption afforded. These two features may be combined in an almost infinite number of ways. Differing maturities in the new bonds may increase their appeal, especially if both banks and individuals are important holders of the old bonds.

If the success of a planned conversion is not entirely assured the government may try the conversion of a small portion of the debt to test the plan. Also, if conditions are propitious, a restrained appeal to the patriotism of the bondholders may be made, as in the British conversion of 1932.

A successful conversion of a large portion of the national debt, with a substantial reduction in interest rates, is one of the greatest achievements of financial statesmanship. It depends upon a combination of favourable market conditions, proper timing, a discriminating judgment in choosing terms, features and techniques, and, finally, an intelligent and carefully planned program of publicity.

Examples of Conversion.—(a) *British*—Great Britain has had more experience with conversions than any other country. Important conversions occurred in 1715, 1749, 1822–24, 1830–34, 1853, 1884, and especially in 1888–89, the latter being known as Goschen's conversions. The largest British conversion of all, and the largest single operation of its kind in financial history, occurred in 1932. It was the more remarkable in that it came within a year after the severe financial crisis of Sept. 1931.

Late in June 1932 it was announced that the 5% War Loan, of which about £2,087,000,000 were outstanding, would be converted into 3½% bonds maturing in 1975 and redeemable after 1952. Conversion was at par. Bondholders were given three months in which to make their choice but a cash bonus of 1% was given for assents within 30 days. All who did not specifically request repayment were deemed to have assented to conversion. The way for conversion was prepared and its progress was facilitated by five factors: (1) dull trade had led to the accumulation of large amounts of idle funds; (2) in a series of moves the real-currency rate of the Bank of England was reduced from 6½% in March 1932 to 3% in June; (3) a temporary but well-placed new security issue; (4) large financial companies holding about one-third of the loan agreed to convert their holdings; and to advise their clients to convert; (5) an elaborate and carefully planned program of publicity was conducted, including an appeal to patriotism.

The conversion was a distinct success. Approximately 72% of the old bonds were converted, leaving only £160,000,000 to be paid in cash. The estimated net annual saving in interest was about £2,000,000.

(b) *French*—Although France failed to take advantage of several attractive opportunities during the 19th century, there were important conversions of the French debt in 1833, 1887, 1894

and 1902. As in Great Britain, however, the largest conversion came in 1932.

In Sept. 1932 the government announced that more than 85,000,000,000 francs of the debt bearing interest at 5% and 6% (except for one small issue bearing 7%) would be converted into new 4½% bonds at par. The new bonds were to mature in 1977 and be redeemable after Jan. 1, 1939. Unless bondholders requested repayment within six days they were considered as assenting to the conversion. Especially favourable terms were provided for small holders who had acquired their bonds before 1910 and had suffered from the decline in the value of the franc. This conversion, too, was successful. More than 95% of the old bonds were converted at an estimated annual saving in interest of about 1,320,000,000 francs.

(c) *United States*—The general policy of the United States has been to convert its debt in relatively small portions through a succession of operations covering several years rather than to convert large amounts in one operation. Important amounts were converted in the years 1870–81, 1900–03, and 1921–30.

The 4½% Fourth Liberty Loan, of which \$6,268,000,000 were outstanding in Oct. 1933, was converted in four separate operations between Oct. 1933 and Sept. 1935. Conversion was at par into four different issues of bonds and two issues of treasury notes. The bonds varied in term from 12 to 25 years and were callable only for short periods immediately preceding maturity. Each successive issue bore a lower rate of interest than the preceding one as follows: 4½%–3½%, 3½%, 2½%, and 2½%. The treasury notes ran for four years and bore interest rates, respectively, of 2½% and 1½%. If holders of the old bonds took no positive action they did not receive new bonds but their old bonds became payable in cash at the proper time. Approximately 85% of the old bonds were exchanged for the new issues at an annual interest saving of about \$74,000,000, additional interest savings were realized on the financing connected with the cash repayments. During World War II the United States maintained its policy of continuous conversion, calling issues bearing high interest rates and replacing them with issues bearing lower rates. DEBUSSY, CLAUDE ACHILLE (1862–1918), French composer, was born at St. Germain-en-Laye on Aug. 22, 1862, and died in Paris on March 26, 1918. His musical training he received at the Paris Conservatoire under Marmoncel, Lavignac, Massenet and Guiraud. There, between 1874 and 1884, he gained many prizes for solfège, pianoforte playing, accompanying, counterpoint and fugue, and, in the last-named year, the coveted Grand Prix de Rome by means of his cantata *L'Enfant prodige*. In this composition germs of unusual and "new" talent were already latent, though, in the light of later developments, it is not very easy to discern them, for then Debussy had not come under the influence which ultimately turned his mind to the system which he afterwards used in so remarkable a manner.

Early Tendencies—It was not long, however, before these highly-individual tendencies revealed themselves. For, in order to fulfil that condition of the Prix de Rome which entails the submitting periodically of compositions to the judges, Debussy sent to them his symphonic suite, *Printemps*, to which exception was immediately taken by the judges on the grounds of its formlessness and other unacademic qualities. Following in the wake of *Printemps* came *La damoiselle élue* for female voices (solo and chorus) and orchestra—a setting of a French version of Rossetti's "The Blessed Damosel"—which, in the eyes of the judges, was even more unorthodox than its predecessor, though, he it said fault was found almost as much with the libretto as with the music. So poor was the impression produced by these works, indeed, that

both were denied the customary public performance

The Rome period over, Debussy returned to Paris, whence shortly he went to Russia, where he came directly under the influence already referred to. That is to say, he absorbed here the native music, especially that of Moussorgsky who, recently deceased, had left behind him the reputation of a musical nihilist, and on his return to Paris the results became speedily apparent. At the same time the effect of this Russian visit should not be overrated, and there is no reason to suppose that it did more than confirm and strengthen tendencies which were already deeply implanted, and would have quite certainly revealed themselves in due course in any event.

Recognition Tardy—Public recognition was rather slow in coming to Debussy, but in 1893 the Société Nationale de Musique performed his *La damoiselle élue*, in 1894 the Ysaye quartet introduced the string quartet (one of his greatest achievements), while in the same year was heard another of his most remarkable and individual creations, the now world famous prelude *L'Après-midi d'un faune*, which could no longer leave room for doubt as to the originality of its composer. Concurrently also, his piano forte pieces were being performed more and more. The works named were followed in due course by his only opera, *Pelléas et Mélisande*, first heard at the Opéra Comique on April 30, 1902. Then it was little understood, but understanding came in due course, and it was recognized as one of the most notable contributions to the repertory of the lyric stage since Wagner.

In an Apologia which he subsequently published, Debussy declared that in composing *Pelléas* he had wanted to dispense with "parasitic musical phrases." "Melody," he observed, "is, if I may say so, almost anti lyric and powerless to express the constant change of emotion and life. Melody is suitable only for the chanson, which confirms a fixed sentiment. I have never been willing that my music should hinder, through technical exigencies, the change of sentiment and passion felt by my characters. It is effaced as soon as it is necessary that these should have perfect liberty in their gestures or in their cries, in their joy and in their sorrow." And these principles found exquisite expression in the work as carried out, of which Dr Ernest Walker has happily observed—"It is one of the great landmarks in the history of opera, it is the summit of musical impressionism, catching every faint nuance of the words, always suggesting rather than saying, but always tense and direct and full of throbbing beauty."

Works for Piano and Orchestra—But, outstanding as is *Pelléas et Mélisande*, it is surpassed even in importance by Debussy's contributions to piano literature, in which by the novelty of his methods he was responsible for the greatest development which had been effected in the technique since Chopin. In such things as *La Soirée dans Grenade*, *Jardins sous la pluie*, *L'Isle joyeuse*, *Reflets dans l'eau*, *Brünnens* and *La Cathédrale engloutie*, he revealed possibilities which had previously been entirely unsuspected in the best known and most exhaustively studied of all instruments. Such music might not be of the highest order, in that it made no pretensions to bigness or grandeur, but in its delicacy, subtlety and refinement, in its exquisite adaptation of the most novel means to the purposes of the most sensitive musical impressionism, it possessed a fascination all its own, and may be said to have opened a new chapter in the history of the art.

Debussy's work for the orchestra was, as a whole, of less significance in the technical sense, he did many fine things also, besides the consummate *L'Après-Midi*, in this field. Such are the exquisite nocturnes *Nuages*, *Fêtes* and *Srènes*, one and all the last word in delicate impressionism. Neither should mention be omitted of his songs, all characterized by the same individuality of style and perfection of workmanship distinguishing his music as a whole, and including such examples as "Mandoline," "Re-cueillement," "Fantoche," "La Flûte de Pan" and "La Chevelure," things which have long since won universal favour.

Musical System—As to the theories, so much debated, of this remarkable musician, probably in the whole range of musical history there has not appeared a more difficult theorist to "place." Unquestionably Debussy introduced a new system of colour into music, which has begun already to exert widespread influence

Roughly, Debussy's system may be summarized thus

First, a scale basis is of six whole tones (enharmonic), as middle C, D, E, **G_b**, **A_b**, **B_b**, which are of excellent sound when super imposed in the form of two augmented unrelated triads,

used frequently incomplete (i.e., by the omission of one note) by Debussy.

Now, upon the basis of an augmented triad a tune may be played above it provided that it be based upon the six tone scale, and a fugue may be written, the re entry of the subject of which may be made upon any note of the scale, and the harmony will be complete.

Secondly, a free use of the chord of the 7th, 9th, 11th and 13th upon every degree of the scale instead of (as in the conventional theory) only upon the tonic, super tonic and dominant, in conjunction with melodies constructed upon the ordinary diatonic scale. These two methods have an interesting connection which can be shown, i.e., let a major 9th be taken

one may conventionally flatten or sharpen the fifth of this (A becoming **G_b** or **G_#** as desired) if both the flattened and sharpened fifths be taken in the one chord this chord is arrived at,

which is composed of the notes of the aforesaid scale whole tone. It will be noticed that chords of the 9th in sequence and in all forms occur in Debussy's music as well as the augmented triad harmonies, where the melodic line is based on the tonal scale. This, in all likelihood, is the outcome of Debussy's instinctive feeling for the association of his so called discovery with the ordinary scale.

But the appearance of a whole tone scale as a by product of two ordinary chords a tritone apart (as in a Neapolitan cadence) decorated by passing notes

must not be confused with the conscientious avoidance of classical key relation which Debussy intends. As is shown in the article HARMONY, even Debussy's whole tone scale really falls into the classical scheme, with much more various results. Debussy himself becomes eclectic in his later works, though he would never have allowed the whole-tone chord to resolve in a classical polyphony. (R H L, X)

DECAEN, CHARLES MATHIEU ISIDORE, COUNT (1769-1832), French soldier, was born at Caen on April 13, 1769. He made his name during the wars of the French Revolution under Kleber, Marceau and Jourdan, in the Rhenish campaigns. In 1799 he became general of division, and fought at Hohenlinden (Dec 1800). Selected by Napoleon early in the year 1802 for the command of the French possessions in the East Indies, he set sail with Admiral Linois early in March 1803 with a small expeditionary force, touched at the Cape of Good Hope (then in Dutch hands), and noted the condition of the fortifications there. On arriving at Pondicherry he found matters in a very critical condition. Though the renewal of war in Europe had not yet been heard of, the hostile preparations adopted by the Marquis Wellesley caused Decaen to withdraw promptly to the Isle of France (Mauritius), where, for eight years, he sought to harass British trade and prepare for plans of alliance with the Mahratta princes of India. They all came to naught. Linois was captured by a British squadron, and ultimately, in 1811, Mauritius itself fell to the British. Decaen then received the command of the French troops in Catalonia. He died of the cholera in 1832.

DECALIN, a chemical substance obtained by hydrogenation of naphthalene (*qv*), it is decahydronaphthalene, $C_{10}H_{18}$. It exists in two stereoisomeric forms (*see* *СТЕРОИЗМИЗМЪ*), which are known as *cis* and *trans* decalin, respectively.

DECALOGUE, another name for the biblical *Ten Commandments*, in Hebrew the *Ten Words* (Deut iv 13, x 4, Exod xxiv 28), written by God on the two tables of stone (Exod xxiv 12, xxxii 16), the so called *Tables of the Revelation* (EV "tables of testimony," Exod xxxiv 29), or *Tables of the Covenant* (Deut ix 9, 11, 15) (in patristic $\Gamma\iota$ *ἡ δεκάλογος ἢ βιβλος* or *νομοθεσία*). These tables were broken by Moses (Exod xxxii 19), and two new ones were hewn (xxxiv 1), and upon them were written the words of the covenant by Moses (xxxiv 27, *sqq*) or, according to another view, by God himself (Deut iv 13, ix 10). They were deposited in the Ark (Exod xxv 21, i Ki viii 9). In Deuteronomy the inscription on these tables, which is briefly called the covenant (iv 13), is expressly identified with the words spoken by Jehovah (Yahweh) out of the midst of the fire at Mt. Sinai or Horeb (according to the Deuteronomistic tradition), in the ears of the whole people on the "day of the assembly," and rehearsed in vi 6-21. The order of the commandments varies in some ancient texts (Vatican ms of the LXX, Nash Papyrus), and there are differences in detail between the form in which the Decalogue appears in Exodus and in Deuteronomy. Further, the term "Ten Words" does not occur in Exod xx, but is found in Exod xxiv 28, in a context which seems to imply that the words mentioned had immediately preceded this passage. Accordingly some scholars would find another Decalogue embedded in Exod xxiv 10-26.

The Decalogue of Exod. xx, Deut. v—Comparison between the two texts, especially in the law of the Sabbath, strongly suggests that neither form is original, both having been expanded from a rather shorter common source. It seems that in the earlier commandments even this common source has been extended from a much more concise primitive form, and that the commands first took the form of simple injunctions and prohibitions of the same type as "Thou shalt not steal."

Different views have been held as to the actual divisions of the Decalogue. Thus Philo regarded Exod. xx 2-3 as the first commandment, while the Talmud made v 2 the first and vv 3-6 the second, thus identifying the sins of apostasy and idolatry. In Christian circles the Roman and Lutheran Churches make the first commandment extend from v 2 to v 6, and distinguish the coveting of a wife from the coveting of property (This last is only possible on the basis of the text in Deuteronomy). The arrangement of the Orthodox Eastern, Calvinistic and Anglican Churches takes Exod. xx 2 as an introduction, separates the prohibition of apostasy from that of the making of images, and unites the clauses prohibiting covetousness into a single commandment. Different opinions obtain as to the date of the Decalogue. The general tendency is to place it late rather than early, though the view that the whole is Mosaic has been revived by some modern scholars (*e.g.* McFadyen and Volz).

people in the wilderness and to a settled agricultural community, others could only have applied to the conditions of the latter. It is worth noting that most of the precepts are found also in the 'Book of the Covenant' (Exod. xx-xxiii E), where they occur unconnected with one another. This fact, together with the very simple type of ritual enjoined, has suggested a Judaean rather than an Ephraimite origin for Exod. xxxiv 12-16.

The Decalogue in Christian Theology—Following the New Testament, in which the "commandments" summed up in the law of love are identified with the precepts of the Decalogue (Mark x 19, Rom. xiii 9, cf. Mark xii 28 ff.), the ancient Church emphasized the permanent obligation of the ten commandments as a summary of *natural* in contradistinction to *ceremonial* precepts, though the observance of the Sabbath was to be taken in a spiritual sense (Augustine, *De spiritu et littera*, xiv, Jerome, *De celebratione Paschae*). The mediaeval theologians followed in the same line, recognizing all the precepts of the Decalogue as moral precepts *de lege naturae*, though the law of the Sabbath is not of the law of nature, in so far as it prescribes a determinate day of rest (Thomas, *summa*, I^{ma} II^{ma} qu. c. art. 3, Duns, *Super sententias*, lib. iii dist. 37). The most important mediaeval exposition of the Decalogue is that of Nicolaus de Lyra, and the 15th century, in which the Decalogue acquired special importance in the confessional, was prolific in treatises on the subject (Antoninus of Florence, Gerson, etc.).

Important theological controversies on the Decalogue began with the Reformation. The question between the Lutheran (Augustinian) and Reformed (Philonic) division of the ten commandments was mixed up with controversy as to the legitimacy of sacred images not designed to be worshipped. The Reformed theologians took the stricter view. The identity of the Decalogue with the eternal law of nature was maintained in both churches, but it was an open question whether the Decalogue, as such (that is, as a law given by Moses to the Israelites), is of perpetual obligation. The Socinians, on the other hand, regarded the Decalogue as abrogated by the more perfect law of Christ, and this view, especially in the shape that the Decalogue is a civil and not a moral law (J. D. Michaels), was the current one in the period of the 18th century rationalism. The distinction of a permanent and a transitory element in the law of the Sabbath is found, not only in Luther and Melancthon, but in Calvin and other theologians of the Reformed church. The main controversy which arose on the basis of this distinction was whether the prescription of one day in seven is of permanent obligation. It was admitted that such obligation must be not natural but positive, but it was argued by the stricter Calvinistic divines that the proportion of one in seven is agreeable to nature, based on the order of creation in six days, and in no way specially connected with anything Jewish. Hence it was regarded as a *universal positive* law of God. But those who maintained the opposite view were not excluded from the number of the orthodox. The laxer conception found a place in the Cocceian school.

tures, chiefly of scenes from French and Algerian domestic life. Probably the best known of all his works is "The Monkey Connoisseurs," a clever satire of the juy of the French Academy of Painting, which had rejected several of his earlier works on account of their divergence from any known standard.

See Moreau's *Decamps et son oeuvre* (1869).

DE CANDOLLE, ALPHONSE • *see* CANDOLLE, AUGUSTIN PRYAME DE

DECAPOLIS, a league of ten cities situated with one exception on the eastern side of the upper Jordan and the sea of Tiberias. The names of the ten cities are Damascus, Philadelphia, Raphana, Scythopolis (= Beth Shan, now *Besun*, W. of Jordin), Gadara, Hippos, Dion, Pella, Gerasa and Kanatha. Of these Damascus alone retains its importance. Scythopolis (as represented by the village of Beisan) is still inhabited, the ruins of Pella, Gerasa and Kanatha survive. Scythopolis in command of the communications with the sea and the Greek cities on the coast, was a very important member of the league. The purpose of the league was mutual defence against the marauding Bedouin tribes that surrounded them.

It was soon after Pompey's campaign in 64-63 B.C. that the Decapolis league took shape. The cities comprising it were united by the main roads on which they lay, their respective spheres of influence touching one another. A constant communication was maintained with the Mediterranean ports and with Greece. The cities were subject to the governor of Syria and tried for imperial purposes.

The best account is in G. A. Smith's *Historical Geography of the Holy Land*, chap. xxviii.

DECASTYLE, the architectural term given to a portico that has ten columns, as in the temple of Apollo Didymaeus at Miletus, also applied to a building with such a portico (see TEMPLE).

DECATUR, STEPHEN (1779-1850), American naval commander, was born at Sinnepuxent (Md.) on Jan. 5, 1779, and entered the U.S. Navy as a midshipman in 1798. He was promoted lieutenant and saw service in the short naval war with France (1798-1800). In 1803 he commanded the "Enterprise," a part of Commodore Preble's squadron in the Mediterranean, and in Feb. 1804 led an expedition into the harbour of Tripoli to burn the U.S. frigate "Philadelphia," which had fallen into Tripolitan hands. He succeeded and made his escape under battery fire with only one man wounded. This exploit earned him his captain's commission and a sword of honour from Congress. He was engaged in all the attacks on Tripoli during 1804 and 1805.

In the War of 1812 his ship the "United States" captured H.M.S. "Macedonian." In 1813 he was appointed commodore to command a squadron in New York harbour, soon blockaded by the British. In an attempt to break out in Jan. 1815 his flagship the "President" was forced to surrender to a superior force. Subsequently he commanded in the Mediterranean against the corsairs of Algiers, Tunis and Tripoli with great success. He was made a Navy commissioner (Nov. 1815), an office which he held until killed in a duel with Commodore Amos Barron at Bladensburg (Md.) on March 22, 1820. A toast of his has become famous—"Our country!" In her intercourse with foreign nations may she always be in the right, but our country, right or wrong?"

See A. S. Mackenzie, *Life of Decatur* (Boston, 1846).

DECATUR, a city of northern Alabama, U.S., on the Tennessee river, 75 mi. N. of Birmingham, served by the Louisville and Nashville and the Southern railways, the county seat of Morgan county. It was formed in 1927 by the consolidation of Albany, formerly called New Decatur (pop. 7,652 in 1920) and Decatur (pop. 4,752 in 1920), and its population was 19,879 in 1950 by the federal census. Manufactures include hosiery, tire fabric, cotton seed oil, copper tubing, steel nuts, sand and gravel, fertilizers, brick, tile, synthetic fibres, packing house products, steel barges and boats, sheet metal products, dairy products, iron grillwork, aluminum wares, concrete products, asphalt, flour and food products.

DECATUR, a town of Georgia, on the Georgia railroad, adjoining the city limits of Atlanta to the east, at an altitude of 1,050 ft., the county seat of DeKalb county. The population was 21,626

in 1950 and was 16,561 in 1940 by the federal census. It is a residential suburb the seat of Columbus Theological seminary (Presbyterian) and of Agnes Scott college for women (Presbyterian), founded in 1889 as a "female seminary" and named after the mother of a benefactor, Col. George W. Scott. Decatur was incorporated in 1835.

DECATUR, a city in central Illinois, U.S., on Lake Decatur, the county seat of Macon county. It is on federal highways 36 and 51 and state highways 47, 48 and 121, and is served by the Baltimore and Ohio, the Illinois Central, the Illinois Terminal (electric), the Pennsylvania and the Wabash railways. The land area is 10.1 sq. mi. The population was 67,801 in 1950 and 59,325 in 1940 by the federal census. Decatur is a principal city, of diversified manufacturing industries in a rich agricultural region underlaid with coal. It has a commission form of government.

The assessed valuation in 1948 was \$148,500,711. Bank debts in 1949 amounted to \$815,312,000.

There are parks in and near the city covering 1,230 ac., in one of which the original county courthouse (of logs) is preserved. Lake Decatur (1.1 mi. long), constructed in 1922-23 to assure an ample and dependable supply of water, provides fishing, boating and bathing.

Corn products and soybean products are among the most important manufactures. Others of importance are plastics, brass plumbing goods, malleable and gray iron, structural and sheet steel. Decatur is the trading centre for a ten-county area.

The Wabash has its principal repair shops there, also its hospital for employees.

The James Millikin university (opened 1903) had an enrolment of 1,331 in 1950. Decatur was founded in 1829 and was named after Stephen Decatur.

Decatur was the first Illinois home of Abraham Lincoln, and the Grand Army of the Republic was organized there on April 6, 1866.

DECATUR, a city of eastern Indiana, U.S., on St. Mary's river, 100 mi. N.E. of Indianapolis, the county seat of Adams county. It is on federal highway 27, and is served by the Erie, the Nickel Plate and the Pennsylvania railroads. The population was 7,272 in 1950 and was 5,861 in 1940 by the federal census. It is surrounded by a farming and lumbering region, and has various factories. Decatur was settled about 1836 and incorporated in 1882.

DECAZES, ÉLIE, Duc (1780-1860), French statesman, was born at Saint Martin de Laye (Gironde) on Sept. 28, 1780. He studied law, became a judge in the tribunal of the Seine in 1806, was attached to the cabinet of Louis Bonaparte in 1807, and was counsel to the court of appeal at Paris in 1811. Immediately upon the fall of the empire he declared himself a royalist, and remained faithful to the Bourbons through the Hundred Days. He made the personal acquaintance of Louis XVIII, who appointed him prefect of police at Paris in July 1815. His marked success in that difficult position won for him the ministry of police, in succession to Fouché, on Sept. 24. In the interval he had been elected deputy for the Seine (Aug. 1815) and both as deputy and as minister he led the moderate royalists. His formula was "to royalize France and to nationalize the monarchy." The Moderates were in a minority in the chamber of 1815, but Decazes persuaded Louis XVIII to dissolve the house, and the elections of Oct. 1816 gave them a majority. As minister of police he had to suppress the insurrections provoked by the ultra-royalists (the White Terror), then, after the resignation of the duc de Richelieu, he took the actual direction of the ministry, although the nominal president was General J. J. P. A. Dessoles (1767-1828). He held at the same time the portfolio of the interior. The cabinet, in

BY COURTESY OF C. B. WILLIS, DECATUR, ILL.
COURTHOUSE IN MACON COUNTY ILL. ERECTED 1829 WHERE ABRAHAM LINCOLN PRACTISED LAW WHILE ON THE 8TH JUDICIAL CIRCUIT

which Byron Louis was minister of finance and Marshal Gouvion Saint Cyr remained minister of war, was entirely Liberal, and its first act was to suppress the ministry of police since Decazes held that it was incompatible with the regime of liberty. His reforms met with the strong hostility of the chamber of peers, where the ultraroyalists were in a majority, and to overcome it he got the king to create 60 new Liberal peers. He then passed the laws on the press, suppressing the censorship. By reorganization of the finances, the protection of industry and the carrying out of great public works, France regained its economic prosperity, and the ministry became popular. But the powers of the Grand Alliance had been watching the growth of liberalism in France with an anxiety that was increased by the election of the celebrated Abbe Grégoire. A threat of foreign intervention, rather than the clamour of the "Ultrar," forced Louis XVIII to urge a change in the electoral law that should render such a "scandal" as Grégoire's election impossible for the future. Dessolle and Louis, refusing to embark on this policy, now resigned, and Decazes became head of the new ministry, as president of the council (Nov 1819). But the exclusion of Grégoire from the chamber and the changes in the franchise embittered the Radicals without conciliating the "Ultrar." The news of the revolution in Spain in Jan 1820 added fuel to their fury, and when, on Feb 13 the duke of Berry was murdered, clamorous tongues loudly accused Decazes of being an accomplice in the crime. Decazes foreseeing the storm, at once placed his resignation in the king's hands. Louis at first refused. But in the end he was forced to yield to the importunity of his family (Feb 17), and Decazes, raised to the rank of duke, passed into honourable exile as ambassador to Great Britain. In Dec 1821 he returned to sit in the house of peers, where he continued to maintain his Liberal opinions. After 1830 he adhered to the monarchy of July, but after 1848 he remained in retirement. He had organized in 1826 a society to develop the coal and iron of the Aveyron, and the name of Decazeville was given in 1829 to the principal centre of the industry. He died on Oct 24, 1860.

His son, LOUIS CHARLES ÉLIE DECAZES, duc de Glucksberg (1819–1886), was born at Paris, and became minister plenipotentiary at Madrid and at Lisbon. In 1871 he was elected deputy to the national assembly by the Gironde, and was chosen by the duc de Broglie as minister of foreign affairs in Nov 1873. He voted with the Orleanists the "constitutional laws" of 1875, and approved of Comte de MacMahon's parliamentary coup d'état on May 16, 1877. He died on Sept 16, 1886.

On the duc Decazes see E. Daudet, *Louis XVIII et le duc Decazes* (1899), and his "L'Ambassade du duc Decazes" in *Revue des deux mondes* for 1899.

DECAZEVILLE, a town of south central France, in the department of Aveyron, 34 mi NW of Rodez by the Orleans railway. Pop. (1946) 12,138. It possesses iron mines and is the industrial centre of the coal and iron fields of the Aveyron, which supply the ironworks established by the duc Decazes, minister of Louis XVIII. A statue commemorates the founder.

DECCAN (Sanskrit *Dakṣiṇa*, "the South"), a name applied, according to Hindu geographers, to the whole of India situated south of the river Narbada. It is sometimes understood as the country between that river and the Kistna, the latter having long formed the southern boundary of the Moslem sultanates of the Deccan. In the more extended meaning it includes the whole Indian peninsula, and in this view the Eastern and Western Ghats constitute the most striking feature. These two ranges unite in the north with the Vindhya mountains and thus form a vast triangle enclosing the high tableland from Cape Comorin to the valley of the Narbada. The surface of this tableland slopes from west to east—the great rivers, the Cauvery, Godavari, Kistna and Pennar, though deriving their sources from the base of the Western Ghats, all finding their way into the Bay of Bengal through fissures in the Eastern Ghats.

History.—For the early history of the Deccan under Asoka and the Andhras, Vakatakas, Chalukyas, Rashtrakutas, Yadavas and Kakatiyas see the article *INDIA History*, and also *BOMBAY Presidency History*.

In 1294 Ala ud Din Khilji, nephew of the Delhi emperor, invaded the Deccan, stormed Deogarh (Daulatabad, q.v.) and reduced the Yadava rulers of Multashira to the position of tributary princes. In 1307, after Ala ud Din's accession to the throne, a fresh series of Moslem incursions began, under Malik Kafur, ending in the final ruin of the Yadava power, and by 1333 the reduction of the Deccan had been completed by Mohammed ben Tughlak. The imperial sway was, however, of brief duration. Telingana and Carnata speedily reverted to their former masters, and this defection on the part of the Hindu states was followed by a general revolt of the Moslem governors, resulting in the establishment in 1347 of the independent Mohammedan dynasty of Bahmani and the consequent withdrawal of the power of Delhi from the territory south of the Narbada. On the dissolution of the Bahmani empire between 1482 and 1518, its dominions were distributed into the five Mohammedan states of Golconda, Bijapur, Ahmednagar, Bidar and Berar. To the south of these the great Hindu state of Vijayanagar (q.v.) still survived, but this, too, was destroyed, at the battle of Talikota (1565), by a league of the Mohammedan powers, who also in their turn soon disappeared before the victories of the Delhi emperors. Their rule was of short duration. In 1705 the Marhattas acquired the right of levying tribute in southern India, and their principal chief, the peshwa of Poona, became a practically independent sovereign. A few years later Nizam ul Mulk, the Mogul viceroy of the Deccan, threw off his allegiance and established the seat of an independent government at Hyderabad (1724). The remainder of the imperial possessions in the peninsula were held by chieftains acknowledging the supremacy of one or the other of these two potentates. In the sequel Mysore became the prize of the Mohammedan usurper Hyder Ali. Mysore formed one of the earliest British conquests in the Deccan. Tanjore and the Carnatic were shortly after annexed. In 1818 the forfeited possessions of the peshwa added to their extent, and these acquisitions, with others which later fell to the paramount power by cession, conquest or failure of heirs, formed a continuous territory stretching from the Narbada to Cape Comorin.

Moreland, *Relations of Golconda in the 17th Century* (London, 1931).

DECELEIA (Gr *Δεκελία*), an Attic deme, on the pass which led over the east end of Mt. Parnassos toward Oropus and Chalcis (Khalkis), commanding the Athenian plain. Its eponymous hero, Decelus, was said to have indicated to the Tyndaridae, Castor and Pollux, the place where Theseus had hidden their sister Helen at Aphidnae, and hence there was a traditional friendship between the Decelians and the Spartans (Herodotus, ix, 73). This tradition, together with the advice of Alcibiades, led the Spartans to fortify Decelia as a basis for permanent occupation in Attica during the later years of the Peloponnesian War, from 413–404 B.C. Its position enabled them to harass the Athenians frequently and to form a centre for fugitive slaves and other deserters. The royal palace of Tatoi was built on the site.

See *PELOPONNESIAN WAR*, THE, also *Judeich* in Pauly-Wissowa, *Realencyclopädie*.

DE CELLES, ALFRED DUCLOS (1843–1925), Canadian writer, was born at St. Laurent, Que., and educated at Quebec seminary and Laval university. He edited successively the newspapers *Le Journal de Québec*, *La Minerve* and *L'Opinion Publique* before becoming librarian of the dominion parliament in 1880. Thenceforth he devoted himself to history, producing *La Crise du régime parlementaire* (1888), *À la conquête de la liberté en France et au Canada* (1891), *Les Constitutions du Canada* (1900), *Les États Unis* (1896), *Papineau, Cartier* (1904), *Cartier et son temps* (1907), *The "Patriotes" of 1837* (1916).

DECEMBER (Lat. *decem*, "ten"), the last month of the year. In the earliest Roman calendar, the year was divided into ten months, the last of which was called December, or the 10th month, and this name was retained for the last, or 12th, month

of the year as now divided Julius Caesar gave the month its present length. The *Saturnalia* occurred in December, which explains the phrase of Horace "libertate Decembri utere." Martial applies to the month the epithet *canus* (hoary), and Ovid styles it *gelidus* (frosty) and *junosus* (smoky). The Saxons called it *winter monath*, winter month, and *heligh monath*, holy month, from the fact that Christmas fell within it. Thus the modern Germans call it *Christmonat*. In December is the date of the winter solstice, when the sun reaches the tropic of Capricorn.

DECEMVIRI, "the ten men," the name applied by the Romans to any official commission of ten, followed by a statement of the purpose for which the commission was appointed, e.g., *Viri stitibus iudicandis, sacris faciundis*, etc.

I Usually, it signified the temporary commission which superseded all the ordinary magistrates from 451 to 449 B.C., for the purpose of drawing up a code of laws. In 462 B.C. a tribune proposed the appointment of a commission to draw up a code to secure for the *plebs* a defence against magisterial caprice. In 452 B.C. decemvirs were appointed to draw up a code, during their tenure of office all other magistracies were in abeyance, but they were bound to maintain the rights of the *plebs*. The first board of decemvirs (wholly patrician) held office during 451 B.C., the chief man among them was Appius Claudius (see CLAUDIUS). The decemvirs ruled with singular moderation, and submitted to the *Comitia Centuriata* a code of laws in ten headings. So popular were the decemvirs that another board of ten was appointed for the following year, some of whom, if the extant list of names is correct, were plebeians. These added two more to the ten laws of their predecessors, thus completing the Laws of the Twelve Tables (see ROMAN LAW). But their rule then became violent and tyrannical. They were forced to abdicate (449 B.C.).

II The judicial board of decemvirs (*stitibus iudicandis*) formed a civil court concerned mainly with the status of individuals. They were originally a body of jurors under the presidency of the praetor (*q.v.*), but eventually became minor magistrates of the republic, elected by the *Comitia Tributa*.

III The priestly board of decemvirs (*sacris faciundis*) was half patrician and half plebeian. They were first appointed in 367 B.C., instead of the patrician *dumviri* who had hitherto performed religious duties. Their chief function was the care of the Sibylline books, and the celebration of the games of Apollo and the Secular Games.

IV Decemvirs were also appointed from time to time to control the distribution of the public land (*agris dandis assignandis*, see AGRARIAN LAWS).

DECEPTION TEST, a name given to the measurement of certain bodily changes caused by the effort of lying, or by fear due to a sense of guilt. Working at Graz, Austria, in 1914, Vittorio Benussi devised a test based on the idea that the rate of breathing is affected by the effort of telling a lie, and that this change could be accurately measured. Three years later Harold Burt further developed this method in the Harvard Psychological Laboratory. In 1915 W. M. Marston, working in the same laboratory, had tested the relation of blood pressure to the effort of lying, but found that all persons examined showed blood pressure higher than normal whether they lied or told the truth.

A psychological deception test, based on association of words, was devised in Austria by Wertheimer and Klein in 1904, and developed by Carl Jung in Switzerland in 1905. Jung read a list of words to three nurses suspected of stealing a purse. Some of these words referred to objects which would have been seen when the theft was committed, and the suspects were asked to give associated words. In Jung's view the guilty nurse gave words which would not have been in the mind of an innocent person and further revealed guilt by delay in answering.

The vegetable alkaloid scopolamine was used by a Texas physician, R. E. House, with the idea that it produced a garrulous

semi-intoxication in which the truth was likely to be blurted out. Another test depends on the variation in electrical conductivity of the skin caused by the secretion of sweat under pressure of emotion. The objection to these forms of trial by ordeal is that they are considered too uncertain to be used with assurance in criminal trials.

See C. T. McCormick, "Deception Test and the Law of Evidence," *California Law Review* (Sept. 1917).

DECEBERATE RIGIDITY see EQUILIBRIUM, ANIMAL.

DE CESARE, CARLO (1824-1882), Italian political economist and legislator, was born at Spinazzola. He studied at Naples and was successively inspector general of the banks of issue, secretary general of agriculture, industry and commerce in 1868, and counsellor of the "cour des comptes." In his chief work, *Manuale di Economia pubblica* (2 vols., 1862), he advocated the doctrines of Ricardo. Of his numerous other works the most important are *Il mondo civile e industriale nel secolo XIX* (1857), *Del potere temporale del Papa* (2nd ed., 1861), *Il primo unitario italiano* (2nd ed., 1861), *La Politica, L'Economia e la Morale dei moderni Italiani* (1869), and *La Germania Moderna* (2nd ed., 1874). De Cesare died at Rome in 1882.

DECHAMPS, ADOLPHE (1807-1875), Belgian statesman, born on June 17, 1807, at Melle, in 1842 became governor of Luxembourg, in 1843 minister of public works, during his office working for the opening up of railways, and in 1845 minister of foreign affairs. His intimate knowledge of contemporary politics is exhibited in his *La Second Empire* (1859), *L'Empire et l'Angleterre* (1860), *La France et l'Allemagne* (1865) and *Le Prince de Bismarck et l'entrevue des trois empereurs* (1873). He died on July 19, 1875.

See E. de Moreau, *A. Dechamps* (Brussels, 1911).

DECHEN, HEINRICH VON (1800-1889), German geologist, was born in Berlin on March 25, 1800, and was educated in the university in that city. He was in the service of the mining department of the Prussian State for 44 years in all, being its director from 1841 to 1864. He paid special attention to the coalformation of Westphalia and northern Europe generally and wrote some important works on the mineralogy of the Rhineland, but his main work was a geological map of Rhemish Prussia and Westphalia in 35 sheets on the scale of 1:80,000, issued with two volumes of explanatory text (1855-82). He published also a small geological map of Germany (1869). He died at Bonn on Feb. 15, 1889.

DECIDUOUS, a botanical and zoological term for "falling in season," as of petals after flowering, leaves in autumn, the teeth or horns of animals, or the wings of insects.

DECIMAL see ARITHMETIC, FRACTION, NUMERICAL SYSTEMS. **DECIMAL COINAGE**, any currency in which the various denominations of coin are arranged in multiples or submultiples of ten (Lat. *decem*) with reference to a standard unit. Thus if the standard unit be 1 the higher coins will be 10, 100, 1,000, etc., the lower 1, 0.1, 0.01, etc. In a perfect system there would be no breaks or interpolations, but the actual currencies described as "decimal" do not show this rigid symmetry. In France the standard unit—the franc—has the 10 franc and the 100 franc pieces above it, the 10 centime below it, there are also, however, 50 franc, 20 franc, 5 franc, 2 franc pieces as well as 50 and 20 centime and other denominations. Similar irregularities occur in the German and United States coinages.

Subject to these practical modifications the leading countries of the world (Great Britain and India are the chief exceptions) have adopted decimal coinage. The United States led the way (1786 and 1792, see MORRIS, GOUVERNEUR), and France soon followed (1799 and 1803), her system being extended to the countries of the Latin Union (1865). Germany (1873), the Scandinavian States (1875), Austria-Hungary (1870, developed in 1892) and Russia (1839 and 1897) are further adherents to the decimal system. The Latin-American countries and Japan (1871) have also adopted it.

In Great Britain proposals for decimalizing the coinage have often been discussed. Besides the inconvenience of altering the

established currency, the difficulty of choosing between the different schemes propounded has been a considerable obstacle. One plan took the farthing as a base then 10 farthings = 1 dot (24d), 10 dots = 1 florin (2s 1d), 10 florins = 1 pound (20s 10d). The advantages claimed for this scheme were the preservation of the smaller coins and the avoidance of interference with the smaller retail prices. Its great disadvantage was the destruction of the existing unit of value. Another proposal would retain the pound as unit and the florin, but would subdivide the latter into 100 "units" (or farthings reduced 4%) and introduce a new coin = 10 units (24d). By it the unit of account would remain as at present, and the shilling (as 50 units) would continue in use. The alteration of the bronze and several silver coins, and the need of readjusting all values and prices expressed in pence, formed the principal difficulties.

A third scheme, which was connected with the assimilation of English to French and American money, proposed the establishment of an 8s gold coin as unit, with the penny or franc and the penny (reduced by 4%) as subdivisions. The new coin would be equivalent to 10 francs or (by an anticipated reduction of the dollar) 2 dollars.

A fourth scheme was put forward by the Decimal association to meet the objections raised by the royal commission on coinage of 1918-20 to the proposed 6-mill system (= £ divided into 1,000 parts). This scheme left all the silver coins unchanged but proposed to increase the value of the copper coins by 20%, so that the shilling would consist of ten instead of 12 pence.

For the general question of monetary scales see MONEY, and for the decimal system in reference to weights and measures see MEASURES AND WEIGHTS.

DÉCIN or **TETSCHEN**, a town on the right bank of the Elbe in Bohemia, Czechoslovakia, it owes its chief importance to the fact that it shares with the sister town of Podmokly (*qv*) the guardianship of the entrance to Bohemia from Saxony. It has a varied development of industry, its products comprising chemicals, confectionery, dyes, plaster of Paris, cotton goods, cellulose, flour and beer. The town is dominated by a rocky height crowned by an old 17th century chateau and the frontier position is evident in the fact that its control alternated between Saxony and Bohemia and in the composition of the population (1930), 13,034, of whom about 10,000 are German. The town has road and rail connection with Bodenbach. With the Sudetenland the town was occupied in 1938 by the Germans.

DECIVS, GAIUS MESSIVS QUINTVS TRAIANVS (A.D. 201-251), Roman emperor, was born at Budalia near Sirmium in lower Pannonia in 201. About 245 the emperor Philip the Arabian entrusted him with a command on the Danube, and in 249 (or end of 248), having been sent to put down a military rising in Moesia and Pannonia, he was proclaimed emperor, against his will. Philip advanced against him and was slain near Verona. Decius had to take the field at once against the Goths, who crossed the Danube and overran Moesia and Thrace. The details of the campaign are obscure. The Goths were surprised by the emperor while besieging Nicopolis on the Danube, at his approach they crossed the Balkans and attacked Philippopolis. Decius followed but was defeated near Beroe. Philippopolis fell and its commander, Priscus, declared himself emperor under Gothic protection. The siege had so exhausted the Goths that they offered to surrender their booty and prisoners on condition of being allowed to retire unmolested. But Decius, who had succeeded in surrounding them, refused their offer. The final engagement took place on swampy ground in the Dobruja near Abritum (Abritus) or Forum Treboni and ended in the defeat and death of Decius and his son. Decius was a capable soldier and administrator. The chief blot on his reign was the systematic and authorized persecution of the Christians, which had for its object the restoration of the religion and institutions of ancient Rome. Decius tried to revive the separate office and authority of the censor. The choice was left to the senate, who unanimously selected Valerian (afterwards emperor) who declined the responsibility. The invasion of the Goths and the death of Decius put an end to the abortive attempt.

See Aurelius Victor, *De Caesaribus*, 29, Ept. 29, Jordanes, *De rebus Geticis*, 18, fragments of Dexippus, in C. W. Müller, *Frag. Hist. Graec.* ii (1849), Edward Gibbon, *Decline and Fall*, chap. 10, H. Schiller, *Geschichte der römischen Kaiserzeit*, i (pt. 2), 1883.

DECIVS MUS, PUBLIVS see MUS

DECIZE, a town of central France, in the department of Nièvre, on an island in the Loire, 24 mi. S.E. of Nevers by the Paris-Lyon railway. Pop. (1936) 3,357. Julius Caesar mentions it as Decetia, stronghold of the Aedui, and in 52 B.C. held there a meeting of the senate to settle the leadership of the tribe and to reply to his demand for aid against Vercingetorix. Later the counts of Nevers owned it, and granted it a charter of franchise in 1246. The church of Saint Aré dates in part from the 11th and 12th centuries, there are also ruins of a castle of the counts of Nevers. Decize is the starting point of the Nivernais canal. The coal mine of La Machine, which belongs to the Schneider company of Le Creusot, lies 4 mi. to the north. The industries of Decize and its suburbs on both banks of the Loire include the working of gypsum and lime, and the manufacture of ceramic products and glass. Trade is in horses from the Morvan, cattle, coal, iron, wood and stone.

DECKEN, KARL KLAUS VON DER (1833-1865), German explorer, was born on Aug. 8, 1833, at Kotzen. He left the military service of Hanover in 1860 to explore East Africa. He reached the volcanic mountain, Kilimanjaro, which he ascended to the height of 15,000 ft., and then explored the East African coast. In 1865 he attempted to navigate the Juba river, but with three others was murdered in Bardera by the Somali, the rest of the party escaped to Zanzibar.

See O. Kersten, *KK v. der Deckens Reisen in Ostafrika* (4 vols., 1869-79).

DECKER, SIR MATTHEW, BART (1679-1749), British merchant and writer on trade, born in Amsterdam in 1679 went to London in 1702 and established himself there as a merchant. He was a director of the East India company, sat in parliament for four years as member for Bishop's Castle, and was high sheriff of Surrey in 1729. He was created a baronet by George I. in 1716. Decker's fame as a writer on trade rests on two tracts. The first, *Serious considerations on the several high duties which the Nation in general, as well as Trade in particular, labours under, with a proposal for preventing the removal of goods, discharging the trader from any search, and raising all the Publick Supplies by one single Tax* (1723, name affixed to 7th ed., 1756), proposed to do away with customs duties and substitute a tax upon houses. He also suggested taking the duty off tea and putting instead a licence duty on households wishing to consume it. The second, an *Essay on the Causes of the Decline of the Foreign Trade, consequently of the value of the lands in Britain, and on the means to restore both* (1744), has been attributed to W. Richardson, but internal evidence is strongly in favour of Decker's authorship. He advocates the licence plan in an extended form, urges the repeal of import duties and the abolition of bounties, and, in general, shows himself such a strong supporter of the doctrine of free trade as to rank as one of the most important fore-runners of Adam Smith. Decker died on March 18, 1749.

See the exhaustive article by Prof. E. C. K. Gonner in Palgrave's *Dict. Pol. Econ.*

DECLARATION, formerly, in an action at English law, a precise statement of the cause of action. Under the system of pleading established by the Judicature act 1875, the declaration has been superseded by a statement of claim setting forth the facts on which the plaintiff relies. Declarations are now in use only in certain local courts of record, and in those of the United States and some British colonies in which the common law system of pleading survives. In the United States a declaration is termed a "complaint," which is the first pleading in an action. It is divided into parts—the title of the court and term, the venue or county in which the facts are alleged to have occurred, the commencement, which contains a statement of the names of the parties and the character in which they appear, the statement of the cause of action, and the conclusion or claim for relief. (See PRACTICE AND PROCEDURE.)

The term is also used in other English legal connections, e.g.,

the Declaration of Insolvency (*see* BANKRUPTCY), the Declaration of Title, for which, when a person apprehends an invasion of his title to land, he may, by the Declaration of Title act 1862, petition the Court of Chancery (*see* LAND TITLES), or the Declaration of Trust (*see* TRUST AND TRUSTEES). By the Statutory Declarations act 1835 a solemn declaration may be substituted for an affidavit. In nearly all civilized countries an affirmation is now permitted to those who object to take an oath or upon whose conscience an oath is not binding (*See* AFFIDAVIT, OATH). An exceptional position in law is accorded to a Dying or Deathbed Declaration. Where the charge is one of homicide it is the practice to admit dying declarations of the deceased with respect to the cause of his death. Unsworn declarations as to family matters, *e.g.*, as to pedigree, may also be admitted as evidence, as well as declarations made by deceased persons in the course of their duty (*See* EVIDENCE).

In the United States the declaration survives in such States as still follow common law pleading. It is a statement of all material facts constituting the plaintiff's cause of action in a methodical and legal form filed appropriately. Where code pleading has been adopted, the complaint supersedes the old declaration.

In the United States, the declaration of intention is that statement of an alien that he intends to renounce his or her citizenship and acquire that of the United States. Popularly it is known as "first papers." It may be filed at any time in a court competent in naturalization matters, even though the alien may not be naturalized until he has been a resident for five years. A declaration expires if the alien fails to file his application for naturalization or "second papers" within a period of seven years thereafter. If subsequently he desires to take out naturalization papers, he must file a new declaration of intention. Two years must elapse between the filing of the declaration of intention and the application for naturalization.

DECLARATION OF INDEPENDENCE in United States history, the act (or document) by which the 13 original States of the Union broke their colonial allegiance to Great Britain in 1776. The controversy preceding the war (*see* AMERICAN REVOLUTION) gradually shifted from one primarily upon economic policy to one upon issues of pure politics and sovereignty, and the acts of Congress, as viewed to day, seem to have been carrying it, from the beginning, inevitably into revolution, but there was apparently no general and conscious drift toward independence until near the close of 1775. The first colony to give official countenance to separation as a solution of colonial grievances was North Carolina, which, on April 12, 1776, authorized its delegates in Congress to join with others in a declaration to that end. The first Colony to instruct its delegates to take the actual initiative was Virginia, in accordance with whose instructions—voted on May 15—Richard Henry Lee, on June 7, moved a resolution "that these United Colonies are, and of right ought to be, free and independent States." John Adams of Massachusetts seconded the motion. The conservatives could only plead the unpreparedness of public opinion, and the radicals conceded delay on condition that a committee be meanwhile at work on a declaration "to the effect of the said resolution," to serve as a preamble thereto when adopted. This committee consisted of Thomas Jefferson, John Adams, Benjamin Franklin, Roger Sherman and Robert R. Livingston. To Jefferson the committee entrusted the actual preparation of the paper. On July 2, by a vote of 12 States—10 voting unanimously, New York not voting, and Pennsylvania and Delaware casting divided ballots (3 votes in the negative)—Congress adopted the resolution of independence, and on the 4th, Jefferson's "Declaration." The 4th has always been the day celebrated, the decisive act of the 2nd being quite forgotten in the memory of the day on which that act was published to the world. "Independence Day" is a holiday in all the States and Territories of the United States. It should also be noted that as Congress had already, on Dec. 6, 1775, formally disavowed allegiance to parliament, the Declaration recites its array of grievances against the crown, and breaks allegiance to the crown. Moreover, on May 10, 1776, Congress had recommended to the people of the Colonies that they form such new governments as their representatives

should deem desirable, and in the accompanying statement of causes, formulated on May 15, had declared it to be "absolutely irreconcilable to reason and good conscience for the people of these colonies now to take the oaths and affirmations necessary for the support of any government under the crown of Great Britain," whose authority ought to be "totally suppressed" and taken over by the people—a determination which, as John Adams said, inevitably involved a struggle for absolute independence, involving as it did the extinguishment of all authority, whether of crown, parliament or nation.

Though the Declaration reads as "In Congress, July 4, 1776" The unanimous Declaration of the thirteen united States of America," New York's adhesion was in fact not voted until the 9th, nor announced to Congress until the 15th—the Declaration being unanimous, however, when it was ordered, on the 19th, to be engrossed and signed under the above title. As read before the army meanwhile, it was headed "In Congress, July 4, 1776. A Declaration by the representatives of the United States of America in General Congress assembled." Contrary to the inference naturally to be drawn from the form of the document no signatures were attached on the 4th. As adopted by Congress, the Declaration differs only in details from the draft prepared by Jefferson, censures of the British people and a noble denunciation of slavery were omitted, appeals to Providence were inserted, and verbal improvements made for the sake of terseness and measured statement. The document is full of Jefferson's fervent spirit and personality, and its ideals were those to which his life was consecrated. It is the best known and the noblest of American State papers. Though open to controversy on some issues of historical fact, not flawless in logic, necessarily partisan in tone and purpose, it is a justificatory preamble, a party manifesto and appeal, reasoned enough to carry conviction, fervent enough to inspire enthusiasm. It mingles—as in all the controversy of the time, but with a literary skill and political address elsewhere unrivalled—state dispute with philosophy. The rights of man lend dignity to the rights of Englishmen, and the broad outlook of a worldwide appeal, and the elevation of noble principles, relieve minute criticisms of an administrative system.

Jefferson's political theory was that of Locke, whose words the Declaration echoes. Both Locke and Jefferson wrote simply of political equality, political freedom. Even within this limitation, the idealistic formulae of both were at variance with the actual conditions of their time. The variance would have been greater had their phrases been applied as humanitarian formulae to industrial and social conditions. The Lockian theory fitted beautifully the question of colonial dependence, and was applied to that by America with inexorable logic, it fitted the question of individual political rights, and was applied to them in 1776, but not in 1690, it did not apply to non-political conditions of individual liberty, a fact realized by many at the time—and it is true that such an application would have been more inconsistent in America in 1776 as regards the negroes, than in England in 1690 as regarded freemen. The Declaration's influence upon American legal and constitutional development has been profound. Locke, says Leslie Stephen, popularized "a convenient formula for enforcing the responsibility of governors"—but his theories were those of an individual philosopher—while by the Declaration a State, for the first time in history, founded its life on democratic idealism, pronouncing governments to exist for securing the happiness of the people, and to derive their just powers from the consent of the governed. It was a democratic instrument, and the revolution a democratic movement, in South Carolina and the Middle Colonies particularly, the cause of independence was bound up with popular movements against aristocratic elements. Congress was fond of appealing to "the purest maxims of representation," it sedulously measured public opinion, took no great step without an explanatory address to the country, cast its influence with the people in local struggles as far as it could, appealed to them directly over the heads of conservative assemblies, and in general stirred up democracy. The Declaration gave the people recognition equivalent to promises, which, as fast as new governments were instituted, were converted by written constitutions into

IN CONGRESS, JULY 4, 1776

THE UNANIMOUS DECLARATION of the thirteen united STATES OF AMERICA

WHEN in the Course of human events it becomes necessary for one people to dissolve the political bands which have connected them with another, and to assume among the powers of the earth, the separate and equal station to which the Laws of Nature and of Nature's God entitle them, a decent respect to the opinions of mankind requires that they should declare the causes which impel them to the separation.—We hold these truths to be self-evident, that all men are created equal, that they are endowed by their Creator with certain unalienable Rights, that among these are Life, Liberty and the pursuit of Happiness.—That to secure these rights, Governments are instituted among Men, deriving their just powers from the consent of the governed,—That whenever any Form of Government becomes destructive of these ends, it is the Right of the People to alter or to abolish it, and to institute new Government, laying its foundation on such principles and organizing its powers in such form, as to them shall seem most likely to effect their Safety and Happiness. Prudence, indeed, will dictate that Governments long established should not be changed for light and transient causes, and accordingly all experience hath shewn that mankind are more disposed to suffer, while evils are sufferable, than to right themselves by abolishing the forms to which they are accustomed. But when a long train of abuses and usurpations, pursuing invariably the same Object evinces a design to reduce them under absolute Despotism, it is their right, it is their duty, to throw off such Government, and to provide new Guards for their future security.—Such has been the patient suifrance of these Colonies, and such is now the necessity which constrains them to alter their former Systems of Government. The history of the present King of Great Britain is a history of repeated injuries and usurpations, all having in direct object the establishment of an absolute Tyranny over these States. To prove this, let Facts be submitted to a candid world.—He has refused his Assent to Laws, the most wholesome and necessary for the public good.—He has forbidden his Governors to pass Laws of immediate and pressing importance, unless suspended in their operation till his Assent should be obtained, and when so suspended, he has utterly neglected to attend to them.—He has refused to pass other Laws for the accommodation of large districts of people, unless those people would relinquish the right of Representation in the Legislature, a right inestimable to them and formidable to tyrants only.—He has called together legislative bodies at places unusual, uncomfortable, and distant from the depository of their public Records, for the sole purpose of fatiguing them into compliance with his measures.—He has dissolved Representative Houses repeatedly, for opposing with manly firmness his invasions on the rights of the people.—He has refused for a long time, after such dissolutions, to cause others to be elected, whereby the Legislative powers, incapable of Annihilation, have returned to the People at large for their exercise, the State remaining in the mean time exposed to all the dangers of invasion from without, and convulsions within.—He has endeavoured to prevent the population of these States, for that purpose obstructing the Laws for Naturalization of Foreigners, refusing to pass others to encourage their migrations hither, and raising the conditions of new Appropriations of Lands.—He has obstructed the Administration of Justice, by refusing his Assent to Laws for

troops among us,—for protecting them by a mock Trial, from punishment for any Murders which they should commit on the Inhabitants of these States.—For cutting off our Trade with all parts of the world.—For imposing Taxes on us without our Consent.—For depriving us in many cases, of the benefits of Trial by Jury.—For transporting us beyond Seas to be tried

for pretended offences.—For abolishing the free System of English Laws in a neighbouring Province, establishing therein an Arbitrary government, and enlarging its Boundaries so as to render it at once an example and fit instrument for introducing the same absolute rule into these Colonies.—For taking away our Charters, abolishing our most valuable Laws and altering fundamentally the Forms of our Governments.—For suspending our own Legislatures, and declaring themselves invested with power to legislate for us in all cases whatsoever.—He has abdicated Government here, by declaring us out of his Protection and waging War against us.—He has plundered our seas, ravaged our Coasts, burnt our towns, and destroyed the lives of our people.—He is at this time transporting large Armies of foreign Mercenaries to compleat the works of death, desolation and tyranny, already begun with circumstances of Cruelty & perfidy scarcely paralleled in the most barbarous ages, and totally unworthy the Head of a civilized nation.—He has constrained our fellow Citizens taken Captive on the high Seas to bear Arms against their Country, to become the executioners of their friends and Brethren, or to fall themselves by their hands.—He has excited domestic insurrections amongst us, and has endeavoured to bring on the inhabitants of our frontiers, the merciless Indian Savages, whose known rule of warfare, is an undistinguished destruction of all ages, sexes and conditions. In every stage of these Oppressions We have Petitioned for Redress in the most humble terms: Our repeated Petitions have been answered only by repeated injury. A Prince, whose character is thus marked by every act which may define a Tyrant, is unfit to be the ruler of a free people. Nor have We been wanting in attentions to our British brethren. We have warned them from time to time of attempts by their legislature to extend an unwarrantable jurisdiction over us. We have reminded them of the circumstances of our emigration and settlement here. We have appealed to their native justice and magnanimity, and we have conjured them by the ties of our common kindred to disavow these usurpations, which would inevitably interrupt our connections and correspondence. They too have been deaf to the voice of justice and of consanguinity. We must, therefore, acquiesce in the necessity, which denounces our Separation, and hold them, as we hold the rest of mankind, Enemies in War, in Peace Friends.—

WE, THEREFORE, the Representatives of the UNITED STATES OF AMERICA, in General Congress, Assembled, appealing to the Supreme Judge of the world for the rectitude of our intentions, do, in the Name, and by Authority of the good People of these Colonies, solemnly publish and declare, That these United Colonies are, and of Right ought to be FREE AND INDEPENDENT STATES, that they are Absolved from all Allegiance to the British Crown, and that all political connection between them and the State of Great Britain, is and ought to be totally dissolved, and that as Free and Independent States, they have full Power to levy War, conclude Peace, contract Alliances, establish Commerce, and to do all other Acts and Things which Independent States may of right do.—And for the support of this Declaration, with a firm reliance on the protection of divine Providence, we mutually pledge to each other our Lives, our Fortunes and our sacred Honor

THE DECLARATION OF INDEPENDENCE OF THE UNITED STATES

The text of the Declaration of Independence. The original document is shown in facsimile on the facing page

rights, which have since then steadily extended

For 101 years after the Declaration was proclaimed it had no permanent home. During its wanderings, it found shelter in 10 cities and 5 states, twice narrowly escaped destruction by fire, and in both the Revolutionary War and the War of 1812 was nearly captured by the British. In 1894, when the text of the manuscript had been dimmed by more than 50 years' exposure to light and its signatures damaged by too frequent rolling of the parchment, the document was placed in a safe in the State Department library. Finally, in 1921, it was removed to the Library of Congress, where it is on permanent exhibition in a shrine specially constructed for its preservation and safekeeping.

The signers were: John Hancock (1737-92), of Massachusetts, president; Button Gwinnett (c. 1732-77), Lyman Hall (1725-90), George Walton (1740-1804), of Georgia, William Hooper (1743-97), Joseph Hewes (1730-79), John Penn (1741-88), of North Carolina, Edward Rutledge (1749-1800), Thomas Heyward, Jr. (1746-1809), Thomas Lynch, Jr. (1749-79), Arthur Middleton (1742-87), of South Carolina, Samuel Chase (1741-1811), William Paca (1740-99), Thomas Stone (1743-87), Charles Carroll (1737-1832) of Carrollton, Md., George Wythe (1726-1806), Richard Henry Lee (1732-94), Thomas Jefferson (1743-1826), Benjamin Harrison (1740-91), Thomas Nelson, Jr. (1718-89), Francis Lightfoot Lee (1734-97), Carter Braxton (1736-97), of Virginia, Robert Morris (1734-1806), Benjamin Rush (1745-1813), Benjamin Franklin (1706-90), John Morton (1724-77), George Clymer (1739-1813), James Smith (c. 1719-1806), George Taylor (1716-81), James Wilson (1742-98), George Ross (1730-79), of Pennsylvania, Caesar Rodney (1728-84), George Read (1733-98), Thomas McKean (1734-1817), of Delaware, William Floyd (1734-1821), Philip Livingston (1716-78), Francis Lewis (1731-1803), Lewis Morris (1726-98), of New York, Richard Stockton (1730-81), John Witherspoon (1722-94), Francis Hopkinson (1737-91), John Hart (1708-80), Abraham Clark (1726-94), of New Jersey, Josiah Bartlett (1729-95), William Whipple (1730-85), Matthew Thornton (1714-1803), of New Hampshire, Samuel Adams (1722-1803), John Adams (1735-1826), Robert Treat Paine (1731-1814), Elbridge Gerry (1744-1814), of Massachusetts, Stephen Hopkins (1707-85), William Ellery (1727-1820), of Rhode Island, Roger Sherman (1721-93), Samuel Huntington (1730-96), William Williams (1731-1811), Oliver Wolcott (1726-97), of Connecticut. Not all the men who rendered the greatest services to independence were in Congress in July 1776, not all who voted for the Declaration ever signed it, not all who signed it were members when it was adopted. The greater part of the signatures were certainly attached on Aug. 2, but at least six were attached later. With one exception—that of Thomas McKean, present on July 4, but not on Aug. 2, and permitted to sign in 1781—all were added before printed copies with names attached were first authorized by Congress for public circulation in Jan. 1777.

Winsor, *Narrative and Critical History of America* vol. vi (1888); R. Frothingham *Rise of the Republic* ch. ii (1872); and A. J. Beveridge, *Sources of the Declaration of Independence* in *Pennsylvania Magazine of Hist. and Bio.*, vol. 1 (1926). There are various collected editions of biographies of the signers, probably the best are John Sandercock's *Biography of the Signers of the Declaration of Independence* (1823-27), and William Brodhead's *Book of the Signers* (1866, new ed. 1875). A facsimile of the original parchment in unimpaired condition is inserted in *P. Force's American Archives*, 5th series, vol. 1 at p. 1595 (1848).

DECLARATION OF LONDON see BLOCKADE, CONTRABAND, PRIZE, NEUTRALITY, VISIT AND SEARCH.

DECLARATION OF PARIS (1856) owes its origin to the diametrically opposing views of Great Britain and France on

the carriage of property at sea at the time of the Crimean War. In 1854 France allowed enemy goods in neutral vessels to go free, but confiscated neutral goods in enemy vessels, whilst Great Britain confiscated enemy goods in neutral vessels, but respected neutral goods in enemy vessels. The situation was an impossible one for neutrals. Accordingly each Power abandoned part of its doctrines and acceded to that of its ally's doctrines. This compromise finds expression in Articles 2 and 3 of the Declaration, which stated four principles of international law—

1 Privateering is and remains abolished. 2 The neutral flag covers enemy's goods, with the exception of contraband of war. 3 Neutral goods, with the exception of contraband of war, are not liable to capture under the enemy's flag. 4 Blockades in order to be binding must be effective, that is to say, maintained by a force sufficient really to prevent access to the coast of the enemy. (See Hertslet, *Treaties*, x, p. 547.)

The Declaration was signed by Austria, France, Great Britain, Prussia, Russia, Sardinia and Turkey, and acceded to by all the Powers except Bolivia, Spain, United States, Uruguay and Venezuela. Spain acceded in 1908. The United States withheld formal adherence on the ground that, not possessing a large navy, she was obliged to rely upon privateers, and she would not agree to their abolition unless the principle of the immunity of private property at sea were generally accepted. At the commencement, however, of the Civil War and again in the Spanish American War, 1898, she declared her adherence to the Declaration for the duration of hostilities only. Spain in the latter war, whilst repudiating any obligation to the Declaration, announced that she would take a similar course.

During the World War it was declared in the British Prize Court that the court would regard the Declaration not only in the light of rules binding in the conduct of war, but as a recognized and acknowledged part of the law of nations, see *The Marie Glaeser*, 1 B. and C. P. 38 (144). But with the disappearance of the "Free List", by the extension of the term "contraband" to all commodities of use, directly or indirectly, to the enemy in the operations of war, by the presumption of hostile destination, by the application of the doctrine of continuous voyage, Article 2 became almost wholly nullified. Article 3 was also rendered almost wholly nugatory by the German submarine method of indiscriminate destruction. Whilst the neutral owner of goods on board an enemy vessel was entitled to their restitution or value when brought in for adjudication, he took the risk of all necessary acts of war. It was held by the French and German Prize Courts that in the case of lawful destruction of an enemy merchant vessel compensation for loss of neutral goods on board could not be claimed. Sinking at sight, without visit and search, was, however, illegal, and it has now been prohibited by the Treaty of Washington, 1922, Part Pap. 1922 [Cmd. 1627], ratified by the United States, the British Empire, Italy and Japan. Article 4 was reproduced in the Declaration of London and it was objected that the so-called blockade of the German coast on the Baltic was not effective, since neutral Baltic States still had access to German Baltic ports. The answer is that the British measures were taken under the law of contraband and not under those of blockade. (H. H. L. B.)

DECLARATOR, in Scots law, a form of action by which some right of property, or of servitude, or of status, or some inferior right or interest, is sought to be judicially declared.

DE CLIFFORD, BARON see CLIFFORD.

DECLINATION, in magnetism is the angle between true north and magnetic north, i.e., the variation between the true (geographic) meridian and the magnetic meridian. It is derived from *lat. declinare*, to decline. In 1596 at London the angle of declination was 11° E. of N., in 1652 magnetic north was true north, in 1815 the magnetic needle pointed 24½° W. of N., in 1891 18° W., in 1896 17° 56' W. and in 1906 17° 45'. The angle is gradually diminishing and the declination will in time again be 0°, when it will slowly increase in an easterly direction, the north magnetic pole oscillating slowly around the North Pole. Regular daily changes of declination also occur. Magnetic storms cause irregular variations sometimes of one or two degrees. (See

TERRESTRIAL MAGNETISM)

In astronomy the declination is the angular distance, as seen from the earth, of a heavenly body from the celestial equator, thus corresponding with terrestrial latitude. (See ASTRONOMY.)

DECOLORIZING, in practical chemistry and chemical technology, the removal of coloured impurities from a substance. Charcoal, sometimes made from blood, bones or sugar, but now most usually made from wood, is frequently used. So called "activated charcoal," which is especially effective as a decolorizing agent, is prepared by treating charcoal with super heated steam for several hours at 800-1,000° C, or with air at 350-400° C. When shaken with a coloured solution, charcoal often retains the coloured substances, leaving the solution colourless. Thus the red colour of wines may be removed by filtering the wine through charcoal, the removal of the dark coloured impurities of crude sugar may be similarly effected. Other "decolorizers" acting through purely chemical reactions are chlorine, sulphurous acid, permanganates and manganesates, all of which have received application in the sugar industry. (See CHARCOAL and ADSORPTION.)

DECORAH, a city of northeastern Iowa, U.S.A., on the upper Iowa river, the county seat of Winneshiek county. It is on federal highway 52, and is served by the Chicago, Milwaukee, St. Paul and Pacific and the Rock Island railways. The population was 6,059 in 1950 and 5,303 in 1940. It is the seat of Luther college (1861). Decorah is supported by farming, and the main product is corn which is fed to hogs, and the hogs in turn are marketed. No corn is sold. A famous ice cave is near by. Decorah was founded about 1849, incorporated as a city in 1871.

DECORATED PERIOD, in architecture, the name of the second of the three periods into which the English Gothic was usually divided, generally embracing the first three quarters of the 14th century. It may itself be divided into two, the earlier half being known as the Geometric period, and the later as the Curvilinear, although no definite date separates these two parts. The Geometric Decorated style is characterized by window tracery based on the arch, the circle and the quatrefoil and trefoil, frequently much cusped. (See CURVE.) Windows of great width and height were thus treated, with two, four, six or even eight lights, or main subdivisions. In the later, or curvilinear style, the ogee curve, or curve of double curvature, controls tracery design. Two main types thus developed, one, in which the tracery bars form a net, the other in which flame-like, or flowing forms predominate. (See TRACERY.) In the entire decorated period moulding profiles are heavy and complex, carved ornament is intricate and of great naturalism. The most famous examples are the east end of Lincoln cathedral and the crossing and western part of the choir of Ely. During the decorated period, church vaulting became much complicated and subdivided by the addition, first of tiercerons, which are additional vaulting ribs springing from the capital, and rising to the ridge, toward the end of the period there also appeared hernes, which are smaller ribs of little structural value, connecting the more important ribs, and so forming star or network patterns. (T F H)

DECORATION DAY, a holiday, known also as Memorial day, observed in the northern states of the United States on May 30, originally in honour of soldiers killed in the U.S. Civil War, but subsequently also in honour of those who fell in later wars. Before the close of the Civil War May 30 was thus celebrated in several of the southern states, in the north there was no fixed celebration until 1868, when (on May 5) Commander-in-Chief John A. Logan, of the Grand Army of the Republic, issued a general order designating May 30, 1868, "for the purpose of strewing with flowers or otherwise decorating the graves of comrades who died in defense of their country during the late rebellion", Logan did this "with the hope that it will be kept up from year to year". In 1882 the Grand Army urged that the "proper designation of May 30 is Memorial Day"—not Decoration day. Rhode Island made it a legal holiday in 1874, Vermont in 1876 and New Hampshire in 1877, and by 1910 it was a legal

holiday in all the states and territories save Alabama, Alaska, Arkansas, Florida, Georgia, Louisiana, Mississippi, North Carolina, South Carolina and Texas. In Virginia May 30 is observed as a Confederate Memorial day. June 3 (the birthday of Jefferson Davis) is observed as Confederate Memorial day in Louisiana and Tennessee, April 26, in Alabama, Florida, Georgia and Mississippi, and May 10, in North Carolina and South Carolina.

DECORATIVE ART, that art which is concerned with the decoration of objects which in themselves are not necessarily beautiful, being practically the same meaning as applied art or the arts and crafts. Decorative art may concern itself with the treatment of architectural units, furniture, textiles or any other object which the human being feels should not only be useful but beautiful. If the object has no use other than that of its aesthetic appeal the art is no longer decorative but falls into what is known as fine art. Good decorative art is appropriate in its adaptation and seems to be a part of the object upon which it is executed, as though it had sprung from within, rather than as though it had been applied on the surface. (See PAINTING, DRAWING, SCULPTURE, ARTS AND CRAFTS, etc.)

DE CORT, FRANS (1834-1878), Flemish poet, was born June 21, 1834, at Antwerp, and died Jan. 18, 1878, at Elsenre. He edited the *Schelde* from 1858, and from 1861 to his death was secretary to the general auditor of the Brussels military court. His *Leederen* (2 vols., 1857), his *Zingsang* (1866) and his *Leidaren* of 1868 show great tenderness and feeling. His translation of poems from Burns appeared in 1862. He made many fine translations from Jassmin, the Provencal poet, and from the German.

DECOY, a contrivance for the capture or enticing of duck and other wild fowl within range of a gun, hence any trap or enticement into a place or situation of danger. Decoys are usually made on the following plan. Long tunnels leading from the sea, channel or estuary into a pool or pond are covered with an arched net, which gradually narrows in width, the ducks are enticed into this by a tame trained bird, also known as a "decoy" or "decoy-duck". In America the "decoy" is an artificial bird, placed in the water as if it were feeding, which attracts the wild fowl within range of the concealed sportsman. The word "decoy" has, etymologically, a complicated history. It appears in English first in the 17th century in these senses as "coy" and "coy duck," from the Dutch *kooi*, a word which is ultimately connected with Latin *cavea*, hollow place, "cage." The term is used in football in the case of deceptive plays, i.e., decoying tacklers in a wrong direction, and is a synonym for trickery of the sort in various sports.

It is also widely used in similar sense in police parlance—detection of crime, etc.

DECREE, in earlier form *Decreet*, an authoritative decision having in some places the force of law, also the judgment of a court of justice. In Roman law, a decree (*decretum*) was the decision of the emperor, as the supreme judicial officer, settling a case which had been referred to him. In ecclesiastical law the term was given to a decision of an ecclesiastical council settling a doubtful point of doctrine or discipline (cf. also DECRETALS). In English law decree was more particularly the judgment of a court of equity, but after the Judicature acts the expression "judgment" (see PRACTICE AND PROCEDURE) has been employed in reference to the decisions of all the divisions of the supreme court. A "decree nisi," now "order nisi," is the conditional order for a dissolution of marriage made by the divorce court. (see DIVORCE.) *Decreet arbitral* is a Scottish phrase for the award of an arbitrator. In some foreign countries, e.g. in Spain, royal decrees may amount to legislation, while in some the subsequent ratification by the legislature is required. In the United States, a decree is the judgment given in courts of admiralty and equity. In addition to the decree nisi, courts of equity sometimes issue decrees of nullity, for annulment of marriages.

DECRESCENDO (It.), abbr. *decresc.*, lit. "decreasing," i.e., as used in the familiar musical direction, diminishing in loudness. The sign  conveys the same meaning.

DECRETALS (*Epistolae decretales*), the name (see DEGREE above), which is given in canon law to those letters of the pope which formulate decisions in ecclesiastical law, they are generally

DECURIO, a Roman official title, used in three connections

1. A member of the senatorial order in the Italian towns, and in provincial towns organized on the Italian model. The number of *decuriones* was usually 100. The qualifications for the office were fixed in each town by a special law (*lex municipalis*). Cicero alludes to an age limit, to a property qualification and to certain conditions of rank. The method of appointment varied. Cicero speaks of the senate in the Italian towns as appointed by a vote of the township. But in most towns the chief magistrate drew up a list (*edictum*) of the senators every five years. The *decuriones* held office for life. They were convened by the magistrate, who presided as in the Roman senate. Their powers were extensive. In all matters the magistrates were obliged to act according to their direction, and in some towns they heard cases of appeal against judicial sentences passed by the magistrate. By the time of Julius Caesar (45 B.C.) special privileges were conferred on the *decuriones*, including the right to appeal to Rome for trial in criminal cases. Under the principate their status underwent a marked decline. The office was no longer coveted, and means were devised to compel members of the towns to undertake it. By the time of the jurists it had become hereditary and compulsory. This change was largely because of the heavy financial burdens which the Roman government laid on the municipal senates.

2. The president of a *decuria*, a subdivision of the *curia* (q.v.)

3. An officer in the Roman cavalry, commanding a troop of ten men (*decuria*).

ΒΙΒΛΙΟΓΡΑΦΙΑ—W. Liebenan, *Stadteverwaltung im römischen Kaiserreich* (1900), Pauly-Wissowa, *Realencyclopädie* (1901), A. H. J. Greenidge, *Roman Public Life* (1901), J. E. Sandys, *Companion to Latin Studies* (1912), with useful bibliography, W. E. Heitland, *The Roman Republic* (1933).

DEDEGATCH, officially known as Alexandroupolis, a seaport of Western Thrace in the Hebrus province, 10 mi. NW of the Maritsa (Erros, Meric) estuary, on the Gulf of Enos (Enez), an inlet of the Aegean sea. Pop. about 12,000, Greeks and Armenians. A monastic community of Derivishes, of the Dede sect, which was established there in the 15th century, shortly after the Turkish conquest, gave the place its name. Until 1871 Dedeğatch was a mere cluster of fishermen's huts. Then settlers attracted by the possibilities of trade in the products of the valonia oak forest near by gathered there. In 1884 it was made a sanjak. In 1889 the Greek archbishopric of Enos was transferred to Dedeğatch. On the opening, in 1896, of the Constantinople Salonika (now Istanbul-Thessalonika) railway, a large proportion of the transit trade which Enos (Enez), situated at the mouth of the Maritsa, had acquired, was diverted to Dedeğatch, and an era of unprecedented prosperity began, but when the railway connecting Burgas on the Black sea with the interior was opened, in 1898, Dedeğatch lost all it had won from Enos. Because of the lack of shelter in its open roadstead, the port did not become the great commercial centre which its position otherwise qualified it to be. It is, however, one of the chief outlets for the grain trade of the Adrianople (Edirne), Demotica and Xanthi districts. In the Balkan War of 1913 the town was occupied for a time by Greeks but later handed to Bulgarians. In 1915, when Bulgarians annexed the coastal plains from the Maritsa to the Struma, Dedeğatch became permanently Bulgarian until 1918. After the collapse of Bulgarian opposition in 1918 the town was used for the concentration of British troops against the Turkish frontier. When the peace treaty drew the Bulgarian frontier along the mountains north of the coastal plains Dedeğatch fell to Greece. After the treaty of Lausanne the Greek frontier was withdrawn to the Maritsa river. Dedeğatch became a frontier town and Enos fell to Turkey. In 1941 Dedeğatch was occupied by Bulgarians.

See *Admiralty Handbook of Macedonia*, pp. 463-464 (1920), *Sure*.

DEDEKIND JULIUS WILHELM RICHARD

1831-1901. German mathematician. Born at Friburg, Baden. Studied at Bonn and Berlin. Held various positions in Prussia. His work on the theory of algebraic numbers (1871, 1879, 1894) each of these profoundly influenced current mathematics. In the first, he defined and exploited the "ideals" later named after him, which passed into the standard course in the real number system sup-

porting analysis. In the third, he created the modern theory of algebraic numbers, in which unique factorization is restored to algebraic integers by means of the ideals (not to be confused with Ernst Kummer's earlier ideal numbers) which he invented. The concept of this theory permeates modern algebra. Inductive of Dedekind's flair for what was to increase in general interest after his time, his works of 1897 and 1900 on dual groups anticipated parts of the current theory of lattices developed after 1933. Dedekind's collected works were published in three volumes, 1930, 1931, 1932. (E. T. B.)

DEDHAM, a town of Massachusetts, U.S., on the Charles river, 10 mi. SW of Boston, the county seat of Norfolk county. It is served by the New York, New Haven and Hartford railroad. The population was 18,499 in 1930 and 15,508 in 1940. The town is primarily residential, with some manufacturing of paper products. Dedham was one of the first two inland settlements of the colony, "planted" in 1635 and incorporated in 1636.

A free public school, supported by direct taxation, was established in 1645.

DEDICATION, the setting apart of anything for a special object, especially the consecration of altars, temples and churches, also the inscription prefixed to a book, etc., and addressed to some particular person, formerly designed to gain the patronage of the person addressed. In law, the setting apart by a private owner of a road to public use. (See *Highway*.)

The Jewish Feast of Dedication was observed for eight days from the 25th of Kislev (i.e., about Dec. 12), to commemorate the purging (164 B.C.) of the temple after its desecration by Antiochus Epiphanes. See 1 Macc. 1:20-54, iv, 36-59, 2 Macc. 1:9, 18, ii, 16, v, 15-16, vi, 1-11, John 8:12, also Josephus, *Antiq.* vii, 6-7, xii, v, 4 (where it is called the Feast of Lights).

Dedication of Churches—The custom of solemnly dedicating buildings set apart for Christian worship must be almost as old as Christianity itself. Before the reign of Constantine Christian churches were few, and any public dedication of them would have been dangerous in those days of persecution. But from the early 4th century allusions to and descriptions of the consecration of churches become plentiful.

Like so much else in the worship and ritual of the Christian Church, this service is probably of Jewish origin. The hallowing of the tabernacle and its ornaments (Exod. xl), the dedication of the temples of Solomon and Zerubbabel (1 Ki. viii, Ezra vi), the rededication of the latter by Judas Maccabaeus (see above), the dedication of Herod's temple (Josephus, *Antiq.* xv, ii, 6), and Jesus' recognition of the Feast of Dedication (John 8, 12, 23)—all support this hypothesis.

Eusebius (*Hist. Eccles.*, x, 3-4) speaks of the dedication of churches rebuilt after the Diocletian persecution, including that of the church at Tyre in A.D. 314-315. The consecrations of the church of the Holy Sepulchre, built by Constantine at Jerusalem (A.D. 335), and of other churches after his time are described by Eusebius and other ecclesiastical historians. From them we gather that every consecration was accompanied by a celebration of the Holy Eucharist, a sermon and special dedicatory prayers. St. Ambrose and other writers mention also the deposition of relics, and a vigil overnight, and there are occasional references to the tracing of the Greek and Latin alphabets on the pavement of the church.

The separate consecration of altars, by sacerdotal blessing and unction with chrism, is prescribed in canons of the councils of Agde (506) and Eponea (517). St. Columbanus (d. 615) is said to have also used holy water (Walafrid Strabo, *Vita S. Galli*, cap. 6). At an early date the right to consecrate churches was reserved to bishops, as by the council of Braga in 563 and in the 8th-century Irish collection of canons known as "Synodus Patrum." Accordingly, it is in the pontifical that we find the form of clerical consecration service. The service is a formal one, and is performed by the bishop, or his delegate, in the presence of the clergy and people. It is a solemn and beautiful ceremony, and is one of the most important in the liturgical life of the Church. The service is performed in the following manner: The bishop, or his delegate, enters the church, and is received by the clergy. He then goes to the altar, and, after a short prayer, he begins the service by reading the Gospel of John 8:12-18. He then reads the Collect, and the Epistle of 1 Peter 2:4-8. He then reads the Gospel of Matthew 23:1-12. He then reads the Canon of the Mass, and the Communion. He then reads the Benediction, and the final prayer. The service is then closed by the blessing of the people.

There is a preliminary office for laying a foundation stone (Maskell, pp 191-94). On the day of consecration the bishop vests in a tent outside the church, proceeds thence to the church door, a single deacon being inside the church, and there blesses holy water, twelve lighted candles being placed outside and twelve inside the church. He sprinkles the walls all round outside, and knocks at the door, these two actions are repeated twice and after the third knocking he enters the church with his attendant clerics, all laity being excluded. He then fixes a cross in the centre of the church and the litany is said, including a special petition for the consecration of church and altar. He next inscribes the Greek and Latin alphabets, in form of a St Andrew's cross, on the pavement cindered for the purpose, blesses water, mingled with salt, ashes and wine, and sprinkles thrice the walls inside the church, then the centre of the church longwise and crosswise on the pavement, and then goes round the outside of the church sprinkling it thrice. Returning to the centre of the church he sprinkles holy water to the four points of the compass and toward the roof. Next he anoints with chrism the twelve internal and twelve external wall crosses, afterwards perambulating the church thrice inside and outside, censuring it.

Consecration of Altar.—Then follows the consecration of the altar. Holy water is mixed with chrism, and with the mixture the bishop makes seven crosses on the altar. The altar is sprinkled seven times or thrice with water not mixed with chrism, and the altar-table is washed, censured and wiped. A cross is made with oil of catechumens in the centre of the altar, the altar-stone is anointed with chrism, and the whole altar is rubbed with oil of catechumens and with chrism. Incense is blessed and the altar censured, five grains of incense being placed crosswise in the centre and corners, and on the grains five slender candle-crosses, which are lit. Afterwards the altar is scraped and cleansed, the altar-cloths and ornaments are sprinkled with holy water and placed on the altar, which is then censured. The service ends with the celebration of mass. The various collects, psalms, anthems, benedictions, etc., have been omitted for the sake of brevity.

The Sarum rite described above is substantially identical with that of Rome, but the latter contains in addition one important feature, viz, the translation of relics, found also in the Gallican and other uses. After the sprinkling of the church, the bishop prepares cement at the altar. He then goes to the place (outside the church) where the relics have been placed overnight and carries them in solemn procession to the church door, where he addresses the people and the founder, and two decrees of the council of Trent are read, together with the deed of foundation. Then the bishop, anointing the door with chrism, enters the church with the relics and deposits them in the cavity on the altar, censes and covers them, and anoints the cover. The altar is then censured and wiped, as in the Sarum order.

This use of relics goes back to the time of St Ambrose (see above), but was not universal. The council of Chalcedon (Chelsea) in 816 ordered that part of the consecrated Host should be enclosed if relics were not obtainable. The tracing of the Greek and Latin alphabets on the church floor can be traced back certainly to the beginning of the 10th century, and is doubtless earlier. Its origin and precise meaning are unknown, but various explanations have been suggested by Rossi and others. The annual commemoration of the dedication of a church is probably as old a custom as that of dedication itself. In the Roman Catholic Church it is observed as a double feast, of the first class, with octave.

The dedication service of the Eastern Church is long and elaborate (see J. M. Neale, *History of the Holy Eastern Church*, part II, 1850, pp 1042-45). Relics are prepared and guarded overnight in a neighbouring sacred church. On the day, the bishop goes to the latter, vests and returns in procession with the relics to the new church and goes round it. When he comes to the door the relics are laid on a table called the tetrapodion and the epistle and gospel are read. A second and third procession follow, after which the bishop is admitted into the church, the relics are placed in the reliquary and set on the altar, and the bishop is wrapped in a roll of linen over his vestments. He then

washes the altar with warm water and with wine and makes crosses on it with chrism. The altar is vested and the service ends with the liturgy, which is repeated duly for seven days.

There is no authorized form for the dedication of a church in the reformed Church of England. A form was approved by the convocation of Canterbury in 1712, and an almost identical form was submitted in 1715, but neither form ever received royal sanction. Anglican bishops have, however, drawn up forms for use in their various dioceses. In the diocese of London, for instance, the bishop, attended by clergy and churchwardens, receives outside the west door a petition for consecration, the procession then moves round the whole church outside, while certain psalms are chanted. On again reaching the west door the bishop is admitted after knocking thrice and advances to the east end of the church. He there lays the keys on the table "which is to be hallowed." The *Veni Creator* is sung, followed by the litany with special suffrages. The bishop then blesses the font, chancel, lectern, pulpit, stalls and holy table. The deed of consecration is read and signed and Holy Communion is celebrated. The Church of Ireland and the episcopal Church of Scotland have no fully authorized form of dedication, but various forms have been issued on episcopal authority.

DEDIFFERENTIATION, a biological term meaning the reverse of differentiation, i.e., for processes which lead to organisms or their parts reverting to greater simplicity, the term reduction has also been employed, but is unsatisfactory as it is in demand for chromosome-reduction. (See CYTOLOGY.) Dedifferentiation in its strict sense should not be applied to simple cases of degeneration, but in practice it is often impossible to draw the line.

Dedifferentiation in many Protozoa (*q.v.*) may be a regular and physiological phenomenon. When Protozoa with complicated structure, such as many Ciliates, reproduce by simple fission, many

of the old structures dedifferentiate, the daughter-cells acquiring new organs of the same kind by new differentiation. In *Bursaria*, Lund has shown that, in addition, damage or unfavourable conditions will cause the whole animal to revert to a sphere without any trace of normal differentiation. Redifferentiation to the normal form may occur from this state or from any stage in the process. Similar total dedifferentiation occurs in the encystment of *Bursaria* and many other unicellular forms.

Starvation is a frequent cause of dedifferentiation. The common *Hydra*, by this and other means, may be made to lose all its tentacles, and eventually revert to a mere spheroid with no mouth, and similar phenomena have been described in sea-anemones. The common jelly-fish *Aurelia*, kept without food, shrinks enormously in bulk, some parts, e.g., the gelatinous bell, being much more reduced than others like the mouth-tentacles, specialized tissues lose their histological differentiation, e.g., the genital organs and the special sense-organs, the tentaculocysts. In the worm *Opheurotrocha*, remarkable dedifferentiation occurs if it is damaged or mutilated. In starvation, there will clearly be a "struggle of the parts," the less resistant breaking down and serving as food for the rest. Starvation itself is apparently favourable to dedifferentiation, but when this has once begun, the tissue can be more readily made to degenerate into mere food-materials. This differential resistance of tissues has sometimes been turned to physiological ac-

FROM DEER, AN INTRODUCTION TO EXPERIMENTAL ZOOLOGY (CLARENDON PRESS).
FIG. 1.—STAGES IN THE DEDIFFERENTIATION OF THE TENTACULOCYST OF AURELIA BY STARVATION.
(1) Normal tentaculocyst. (2) Slightly dedifferentiated. (3) Dedifferentiated to a small knob without the characteristic structure.

These do not revert to a morphologically simpler state, but become smaller, living upon their own capital. As Child showed, these reduced specimens not only acquire the proportions of normal young animals, but are in most respects physiologically young, they have undergone regeneration ($q\ v$). Here the destruction of reserves and the altered surface volume relations probably effect the change automatically.

Sea-urchin larvae dedifferentiate readily in unfavourable con-

FIG 5—DEDIFFERENTIATION IN CORYMPHA FOLLOWED BY REDIFFERENTIATION WITH NEW POLARITY

(1) A piece of cut stem. (2) The end nearest to the polyp. (3) The same after dedifferentiation in dilute alcohol in sea water. (4) When replaced in pure sea water redifferentiation occurs but the new stem axis is at right angles to the old the polyp being formed where oxygen is most abundant.

dations, resorbing arms and skeleton, and eventually becoming mouthless lumps. This tendency has been taken advantage of in nature, and dedifferentiation of larval tissues, followed by their resorption into the adult rudiment, is the method of normal metamorphosis ($q\ v$).

A striking type of dedifferentiation is that of tumour tissue malignant and otherwise. When a tumour is formed, the cells of the tissue from which it arises lose some of their differentiation. Roughly speaking, the greater the malignancy, the more complete the dedifferentiation (See CANCER). This type of dedifferentiation apparently differs importantly from that hitherto discussed, for tumour cells are characterized by undue activity and multiplicative power, whereas in the other type activity is reduced, and multiplication, if present, stopped. Possibly the existence of histological differentiation is only possible at a not too high level of metabolic activity, and relatively such stable scaffoldings as connective tissue fibrils, muscle-fibres, nerve-

FROM HUXLEY, PHENOMENA IN DEDIFFERENTIATION

FIG 6—REDUCTION PHENOMENA IN THE ASCIDIAN CLAVELINA (1) Upper part of normal specimen showing heart (below to right) gut, pharynx, and rectum (yellow to left) with above pharynx opening by upper aperture of atrium (opening by aperture to left). The small circles are all slit leading from pharynx to atrium. (2) to (5) stages in dedifferentiation of the same specimen to isolate

fibrils etc. are only constructed and maintained when the cell activities are kept at a certain pitch, and are broken down when they are higher, just as to use a rough analogy sandbanks are only laid down in a river when its rate of flow is suitable and are destroyed if its speed increases. On the principle of the struggle of the parts, it would be expected further that if cell-metabolism were altered so as to encourage cell reproduction less food-material would be available for maintaining structural differentiation or for activities such as secretion. However, these views, though interesting, are admittedly speculative. They do

not in any case cover all the facts, since differentiation can be shown to be sometimes caused by presumably chemical stimuli from another kind of tissue, e.g., when kidney tubule tissue is cultivated alone in artificial media (see TISSUE CULTURE) its cells dedifferentiate entirely, but when connective tissue is added, the tubule-cells differentiate to form regular tubules.

In any event, it is a well established fact that active cell multiplication is incompatible with the maintenance of differentiation, we may accordingly correlate the dedifferentiation of cancer cells with this fact, and conclude that its origin is different from the dedifferentiation correlated with lowered activity.

Dedifferentiation associated with increased cell multiplication is also seen in regeneration. In many cases, the first process observed at the cut surface after wound-healing is rapid multiplication of cells to form a so called regeneration blastema, consisting of cells dedifferentiated as far as visible characteristics go. That they are also dedifferentiated in other respects is shown by the interesting results obtained in newts, where grafting of a young regeneration blastema, e.g., of a limb, to some other region, e.g., the newly cut stump of the tail, will cause the blastema to complete the organ on to which it is grafted, instead of that by which it was first regenerated (See REGENERATION IN ANIMALS, EXPERIMENTAL EMBRYOLOGY).

It will be seen that several diverse processes are at present lumped together under the head of dedifferentiation. Not only is the dedifferentiation correlated with increased multiplicative activity to be sharply distinguished from that correlated with depression of activity, but among depressant agencies starvation, at least in moderate degree, probably has a different, less pathological effect than exposure to chemically unfavourable conditions. Distinction should also be made between reversible dedifferentiation and that which is irreversible and therefore leads to degeneration (though reversible dedifferentiation, if long continued, often passes over into irreversible). In reversible cases, investigation is needed as to whether the dedifferentiated cells themselves redifferentiate (as in Protozoa, and undoubtedly in some Metazoan cases, e.g., in early stages of *Clavelina's* dedifferentiation), or whether they degenerate, and redifferentiation occurs from undifferentiated "reserve" cells. Investigation is also needed with reference to "metaplasia"—the capacity for tissues to transform from one differentiated type into another. While this undoubtedly occurs, it is probably confined to the power of a tissue to pass from lower to higher grade of differentiation, as when non cornified epidermis becomes converted into cornified under abnormal stimuli, and to redifferentiation in a new direction after passing through a de-differentiated phase in which cell multiplication has taken place, as in the above-cited example from regeneration. The study of tissue culture may solve several of these problems.

DEDUCTION, a term used in common parlance for the process of taking away from, or subtracting (as in mathematics),

BY COURTESY OF THE ZOOLOGICAL STATION, NAPLES

FIG 7—DEDIFFERENTIATION IN CLAVELINA

Internal anatomy of a specimen, showing the way in which certain organs dedifferentiate more rapidly than others.

and specially for the argumentative process of arriving at a conclusion from evidence, *i.e.*, for any kind of inference (from Lat *deducere*, to take or lead from or out of, derive). Two forms of the verb are used, "deduce" and "deduct", originally synonymous, they are now distinguished, "deduce" being confined to arguments, "deduct" to quantities. In this sense it includes both arguments from particular facts and those from general laws to particular cases. In logic it is generally used in contradiction to "induction" for a kind of mediate inference in which a conclusion (often itself called the deduction) is regarded as following necessarily under certain fixed laws from premises. This, the most common form of deduction, is the syllogism (*q.v.*, see also *LOGIC*), which consists in taking a general principle and deriving from it facts which are necessarily involved in it. This use of deduction is of comparatively modern origin, it was originally used as the equivalent of Aristotle's *ἀναγωγή* (see *Prior Analytics*, B xxv). The modern use of deduction is practically identical with the Aristotelian *ἀναγωγισμός*. Logical usage is somewhat inconsistent. On the one hand, Deduction is said to be from a universal premise, on the other hand, even syllogisms consisting of singular propositions only are described as deductive. To secure consistent usage it is best to apply the term *deduction* to all inferences from a universal proposition (even to immediate inferences of a singular or particular proposition from a universal) and to no other inference (such as singular syllogisms). Another source of confusion lies in the fact that in Mathematics the term deduction is sometimes used as synonymous with *Analysis*. Descartes' "deductive method" is often misunderstood for this reason as it covers both deduction proper and this analytic method.

DEE, JOHN (1527–1608), English mathematician and astrologer, was born in London, and educated at St John's college, Cambridge, becoming a fellow of Trinity. He spent two years at Louvain and at Rheims in study and lecturing, returning to England in 1551, when he received a pension from Edward VI, which he exchanged for the living of Upton-on-Severn. Soon after Mary's accession he was imprisoned on a charge of using enchantments against the queen's life, but was released in 1555. Dee enjoyed the favour of Queen Elizabeth. He was asked to name a propitious day for the coronation, gave lessons to the queen in the mystical interpretation of his writings, was sent abroad in 1578 to consult with German physicians and astrologers on the nature of her illness, and was employed by her in establishing the claim of the Crown to the overseas countries discovered by British subjects. In 1581 began his collaboration with Edward Kelly, who professed to have discovered the philosopher's stone and to be able to raise spirits. The two spent the years 1583–89 in Poland and Bohemia under the patronage of Albert Laski, palatine of Siradez. Dee returned to England in 1589. He was helped over his financial difficulties by the queen and his friends. In May 1595 he became warden of Manchester college. In Nov 1604 he returned to Mortlake, where he died in Dec 1608, at the age of 81, in the greatest poverty. Dee's *Speculum* or mirror, a piece of solid pink-tinted glass about the size of an orange, is preserved in the British Museum.

His principal works are *Propaedeumata aphoristica* (1558), *Monas hieroglyphica* (Antwerp, 1564), *Epistola ad Fredericum Commandinum* (Pesaro, 1570), *Preface Mathematical to the English Euclid* (1570), *Drivers Annotations and Inventions added after the tenth book of English Euclid* (1570), *Epistola praefixa* *Praefatio ad Euclidem* (1570), *Praefatio ad Euclidem* (1570).

DEE, river, south Aberdeenshire, Scotland, flowing generally eastwards from its source in the west of the county till it reaches the North Sea at the city of Aberdeen. It rises in the Wells of

Dee, a spring on Ben Braerach, one of the Cairngorms, at a height of 4,061 ft. With its tributaries the river drains an area of 1,000 sq m. Rapid and turbulent during the first half of its course of 95 m, it broadens below Aboyne and the rate of flow is diminished. The channel towards its mouth was artificially altered in order to provide increased dock accommodation at Aberdeen, but, above, the stream is navigable only for barges and small craft for a few miles. It runs through beautiful scenery especially in Braemar. About two miles above Invercy it enters a narrow rocky gorge, 300 yd long and only a few feet wide at one part, and forms the rapids and cascades of the famous Linn of Dee. One of the finest of Scottish salmon streams, it retains its purity almost throughout. The principal places on the Dee are Castleton of Braemar, Ballater, Aboyne, Kincardine O'Neil, Banchory, Culter and Culs.

DEE, a river of Wales and England. It rises in Bala Lake, Merionethshire. Leaving the lake near Bala, it flows north east to Corwen and turns east past Llangollen to near Overton, and then bends nearly north to Chester, and thereafter north west through a great estuary into the Irish Sea. In the Llangollen district the Dee crosses Denbighshire, and thereafter forms the boundary of that county with Shropshire, a detached part of Flint, and Cheshire. From Bala to Overton (35 m), the river falls about 330 ft, and its course lies through a narrow, beautiful valley, enclosed on the south by the steep slopes of the Berwyn Mountains and on the north by a succession of lesser ranges. The Vale of Llangollen is especially famous. Here an aqueduct of the Shropshire Union canal bestrides the valley, it is a remarkable engineering work completed by Thomas Telford in 1805. The Dee has a total length of about 70 m and a fall of 530 ft. Below Overton it debouches upon its plain track. Below Chester it follows a straight artificial channel to the estuary, and this is the only navigable portion. The estuary, which is 14 m long, and 5½ m wide at its mouth, between Hibley Point and Point of Air, is not a commercial highway like the Mersey, for at low tide it becomes a vast expanse of sand, through which the river meanders in a narrow channel. The tide rushes in with great speed over the sands, and their danger is illustrated in the well-known ballad "The Sands of Dee" by Charles Kingsley. The Dee drains an area of 813 sq m.

DEED, in law, a contract in writing, sealed and delivered by the party bound to the party intended to benefit. Contracts or obligations under seal are called in English law *specialties*, and down to 1869 they took precedence in payment over *simple contracts*, whether written or not. Writing, sealing and delivery are all essential to a deed. The signature of the party charged is not material, and the deed is not void for want of a date. Delivery, it is held, may be complete without the actual handing over of the deed, it is sufficient if the act of sealing were accompanied by words or acts signifying that the deed was intended to be presently binding, and delivery to a third person for the use of the party benefited will be sufficient. On the other hand, the deed may be handed over conditionally as an *escrow*, in which case it will not take effect as a deed until the conditions are performed. A deed indented, or indenture (so called because written in counterparts on the same sheet of parchment, separated by cutting a wavy line between them so as to be identified by fitting the parts together), is between two or more parties who contract mutually. The actual indentation is not now necessary to an indenture. The *deed-poll* (with a polled or smooth cut edge, not indented) is a deed in which one party binds himself without expression of any obligations undertaken by another party. (See *CONTRACT*.)

Statutes have been enacted in many of the United States, as in Great Britain and her colonies, setting forth certain short and convenient forms for deeds, thus giving effect to statutory provisions and forms. In the United States a deed has the effect of feoffment with livery of seisin or as a deed under the statute of uses or of any species of conveyance necessary to effect the intent of the parties and not repugnant to the legal requirements.

DEED REGISTRATION see *LAND TITLES*

DEEMSTER or **DOOMSTER**, the former title of an officer attached to the High Court of Justice in Scotland who pronounced the doom or sentence on condemned persons. Mention of this

office is made in the Doomsday Book. Deemster is the title proper to each of the two justices of the Isle of Man.

DEER, originally the name of one of two British species, the red deer or the fallow deer, but now extended to all the family Cervidae (see ARTIODACTYLA, PECORA, UNGULATA). Briefly, deer may be defined as Pecora in which antlers are usually present in the male, when no antlers are developed, the upper canine teeth are elongated and sabrelike. The antlers arise from pedicles or bony projections of the frontal bone, when a new antler is to be formed the summits of these pedicles become highly vascular and from the blood thus supplied a bony secretion is deposited. During its growth the antler is covered with soft, hairy skin, through which run a number of blood vessels, this skin is known as the velvet. Toward the completion of the antler's growth a more or less prominent ring of bone, the burr or coronet, is deposited at its base just above the junction with the pedicle, this tends to constrict the blood vessels, and thus cut off the supply of blood from the antlers. When the antlers are freed from the velvet—a process usually assisted by the animal rubbing them against trees—they have a more or less rugose surface, owing to the grooves formed in them by the nutrient blood vessels. In the antlers of the red deer group, which form the type of the whole series, the following names have been applied to their different component parts and branches. The main shaft is termed the beam, the first or lowest tine the brow antler, the second the bezel antler, the third the tree antler, or royal, and the branched summit the crown, or surroysals.

The Cervidae are distributed all over Europe, Asia, northern Africa and America, but are unknown in Africa south of the Sahara. They are essentially woodland animals and where forced to dwell in open country, as in the highlands of Scotland, become stunted. Thus the prehistoric remains found in the Scottish peat bogs indicate that a moderate sized old-time red deer (*Cervus elaphus*), which was a forest dweller, was a third larger than well grown modern forms. That this is not due to deterioration of the stock, but primarily to the conditions of the environment, is shown by the fact that the descendants of Scottish deer introduced into New Zealand are among the largest specimens known. The existing members of the family are arranged in two subfamilies, the Moschinae containing only a single species, the musk deer, and the Cervinae, including not only the true deer but the muntjaks, roe deer, mule deer, etc.

The subfamily Moschinae is distinguished by the presence of a gall bladder and, in the males, a large caudal gland, and by the absence of antlers, face glands and foot glands. The hemispheres of the brain are comparatively smooth, with few convolutions. The subspecies are distributed over a large part of central and northeastern Asia, from Gilgit southward to Cochinchina, and eastward to Korea. The musk deer or kastura (*Moschus moschiferus*) stands about 20 in. at the shoulder, with the hindquarters elevated, but the Korean subspecies is smaller and more slenderly built. The hair is thick and brittle, resembling pith, the general colour is brownish speckled with gray. The ears are large and the upper canine teeth of the males greatly enlarged, projecting well beyond the lip margin. The tail is very short, and the naked area of the muzzle is extensive. Musk deer are forest-dwelling animals, usually found at considerable elevations, the males secrete the "musk," from which the animal derives its name, in an abdominal gland. The record specimen carries canine teeth which project out beyond the jawbone for a distance of 3½ in., these weapons appear to be chiefly used for fighting, the bucks engaging in severe combats during the pairing season.

The Cervinae have no gall bladder or caudal gland but these are foot glands at least in the hind limbs (absent in *Pudu*), antlers are, as a rule developed and are characteristic of all true deer. The cerebral hemispheres present numerous convolutions. It is an interesting point that the ratio between body weight and antler weight increases with the absolute size of the animal. Thus in the red deer (*Cervus elaphus*) it was found that in stags of mean weight 74.4 kg the antler weight was 2.2% of the total in stags of mean weight 120.6 kg, it was 3.03% and in those of 211.8 kg, 4.21%, a point of great evolutionary

significance. The growth of the antlers depends also upon a number of other circumstances which are favourable or unfavourable to the production of large, heavy antlers. Lime in the soil is very important, and the amount of food available, depending on the weather, is also influential. The successive antlers of a stag increase rapidly in weight during the first few years, but after the 11th year, and sometimes before, decrease again ("go back"). The percentage increments for the red deer from Warrnambool park are: second year, 230.6%, third, 72.2%, fourth, 38.6%, fifth, 18.1%, sixth, 8.5%, seventh, 5.2%. The antlers are used in fighting other stags and only exceptionally, or as a last resort, for defense, deer trusting rather to their fleetness to escape from an enemy. It is a remarkable fact, however, that antlerless stags, which fight with their fore hooves, seem often to be able to vanquish their antlered rivals. Most deer (but not the roe) are polygamous, the males fighting fiercely for possession of the females.

The subfamily contains 19 genera which vary in size from the pudu, standing only about 13½ in. in height, to the gigantic moose and elk.

Muntiacus—The members of this genus agree with all the other Cervinae, excepting the reindeer and caribou (*Rangifer*), in the absence of antlers in the females and the presence of a small, bare muzzle. They are known popularly as muntjaks or barking deer and are characterized by the tuslike development of the upper canine teeth in the males, a feature in which these animals approach the condition found in the musk deer and resembling in this respect the tufted deer (*Elaphodus*) and the Chinese water deer (*Hydropotes*). Six species and numerous subspecies have been described, all are small animals, with small and simple antlers consisting of a small brow antler and a beam, arising from long, bony pedicles which are continued downward to form prominent ridges on the frontal region of the skull. In the females these pedicles are represented by small, bony prominences surmounted by tufts of hair. The ears are small and the tail long and thin. The various species are distributed over the Indo-Malayan region eastward as far as Sumatra and Borneo, a number of forms occur in China and one in Formosa, muntjaks do not extend into Japan. The record length of the antlers, taken from the burr to the tip, is 10½ in. The males stand about 20 to 22 in. in height at the shoulder and weigh about 38 lb.

Elaphodus contains but a single species, *E. cephalopus* or Chinese tufted deer, distinguished from the muntjaks by the small size of the antlers and by the supporting pedicles diverging inferiorly. Further, the pedicular ridges on the frontal region are absent. Four races are known, all confined to China. In size these deer about equal the larger species of muntjak.

Dama—Two species of *Dama* are now recognized, *D. dama* and *D. melopotamica* from Iran, they are popularly known as fallow deer. In this genus, as in all the remaining genera except *Hydropotes*, the male canine teeth, when present, are not tuslike. The antlers are large and are supported on short pedicles which do not form frontal ridges as in the muntjaks, the bezel antler is normally absent, and the beam is palmated and bears numerous snags on the hinder edge. The coat is usually spotted with white in summer, and the height at the shoulder is about 3 ft. Originally the species were restricted to the Mediterranean countries and Iran, the typical species has, however, been introduced into many parts of Europe. The extinct Irish elk (*Megaceros*) is an allied genus.

Axis—Some authors regard the genera *Axis*, *Hyelaphus*, *Rusa*, *Rucervus* and *Sika* as subgenera of *Cervus*, but it seems more convenient to regard them as distinct. The chital or spotted deer (*Axis axis*) resembles *Dama* in the coat being spotted with white, the antlers are, however, very different, being long, slender and not palmated. They are three-tined, the brow antler forming a right angle with the beam. These Indian deer are of medium size, standing about 36 in. at the shoulder, fine antlers measure as much as 39 in. along the outer curve.

Hyelaphus—Closely allied to the chital, the hog deer of the genus *Hyelaphus* are more stocky in build and the horn pedicles longer. The auditory bullae are very large and the coat is either spotted in summer or uniformly coloured throughout the year. The two species are confined to the oriental region. *H. porcus* is the best known.

Rusa—This genus includes large, medium-sized and small deer, normally carrying three-tined antlers in which the brow antler forms an acute angle with the beam. The coat is long and shaggy and uniformly coloured in the adults. The species are widely distributed over the oriental region, extending northward as far as Szechuan. Five species are recognized, of which the sambar (*R. ussurorum*) is the best known. This species is typically a very massive animal standing as much as 5½ ft. at the shoulder, some stags carry exceptionally large antlers (45 to 50 in. in length).

Rucervus—In this genus the species of which are large, the second (be) antler is wanting and the beam divides into four or more curved branches, the brow antler forms either a right angle or continuous curve with the beam. The range includes a large part of southern Asia, extending to the island of Hainan. *R. du-rucellus*, the bawingha

the year following. When at last it reached Spain it was received with great enthusiasm, but in view of the tardy recognition of the composer in his own country overtures were made to him to become a naturalized Frenchman and so improve his chances of being heard in Paris. This he declined to do, and on the outbreak of World War I in 1914 he went back to Spain where he made an exhaustive study of Spanish folk music—in particular of the *cante* of Andalusia—before settling in his new home in Granada in the precincts of the Alhambra. The traditional music of Spain provides an unusually rich source of inspiration, containing as it does melodic elements from the church modes introduced by early Christians and eastern rhythms brought by the Moors. De Falla's researches in this field made him a national composer in the profoundest sense of the word. He made comparatively little use of traditional melodies as they stood, for although he believed that the modality of folk tunes should, and does, form the basis of all great music, his belief implied not only a complete absorption of the spirit of that modality but a thorough testing of the material in the light of the composer's aesthetic and ethical principles. Acting upon this, he submitted his own work to the most searching revision before it was given to the public, though fortunately without destroying its effect of spontaneity. He was a firm believer in tonality and in consonant chords, having had no love of dissonance for its own sake. His best-known work is the brilliant second ballet, *The Three-cornered Hat*, first played at the Alhambra, London, in 1919. His first ballet, *Love the Magician*, was performed in Madrid in 1915. Another dramatic work is *Master Peter's Puppet-Show*, a scenic version of a chapter from *Don Quixote*. He also wrote *Nights in the Gardens of Spain* for piano and orchestra, *Concerto for harpsichord (or piano), flute, oboe, clarinet, violin and violoncello*, *Éscapes espagnoles* for piano, and *Seven Spanish Folk-Songs*. He died on Nov. 11, 1946.

See Manuel de Falla, *Immature Essays* (J. & W. Chester, Ltd., London), A. E. Hill (ed.), *Dictionary of Modern Music and Musicians* (London, 1924).

DEFENDER OF THE FAITH (Lat. *Fides Defensor*), a title belonging to the sovereign of England in the same way as *Christianissimus* (Most Christian) belonged to the king of France, and *Catholicus* (Catholic) belongs to the ruler of Spain. It seems to have been suggested in 1516, and although certain charters were appealed to in proof of an earlier use of the title, it was first conferred by Pope Leo X on Henry VIII. The bull granting the title is dated Oct. 11, 1521, and was a reward for the king's treatise against Luther. When Henry broke with the papacy Pope Paul III deprived him of his designation, but in 1544 the title of "Defender of the Faith" was confirmed to Henry by parliament, and was used by his successors on the English throne.

DEFENSE see PRACTICE AND PROCEDURE

DEFENSE MECHANISMS By defense mechanisms, in psychology, is meant a group of acquired adjustive techniques which are developed and used by human beings in overcoming, circumventing, avoiding, escaping from or ignoring frustration and threat. By means of these techniques the individual manipulates situations and reduces the neuromuscular tensions of need or anxiety, of conflict, of thwarting and suspense. As in the case of other learned behaviour, a person need not recognize or identify this procedure to be able to use it effectively. This is implied in popular terminology by the statement that defense mechanisms are as a rule "unconscious."

Defense mechanisms, as products of learning, show a remarkable degree of similarity in their patterns from person to person, at least within our culture. When this similarity was recognized by students of behaviour pathology early in the 20th century, considerable speculation arose concerning the possibility that we might all inherit a "racial unconscious" which in some unknown way determined our patterns of defense. With the development by psychologists of a more adequate understanding of social learning, however, the hypothesis of a "racial unconscious" was discarded in favour of more fruitful explanations in terms of acquired habits. The relative uniformity is actually not difficult to account for when we reflect that human beings are all very much alike in structure, and that in a given culture they are all faced by

certain fundamental problems of adjustment, common to the social environment which they share.

The individual differences that have been found in habitual reliance upon one or another defense mechanism have turned out to be of greater significance for abnormal psychology than the similarities. These differences arise principally from variations in the degree to which each mechanism, or adjustive technique, is used and developed by a given person, particularly during childhood and adolescence. Long before full biosocial maturity has been reached, most persons show well marked preference for certain techniques, and neglect of others, although they themselves seldom recognize their preference or neglect. In many of the behaviour disorders it is possible to trace the inadequacies and distortions of personality organization to the overdevelopment, underdevelopment or maldevelopment of the various defense mechanisms.

Aggressive Defense Mechanisms—Direct aggression is one of the simplest of human reactions to frustration and threat, but under the conditions of adult social organization there are comparatively few circumstances in which it is sanctioned. Most children learn early in life that the nonspecific aggressive temper tantrum and the specific direct aggression are alike relatively unsuccessful in dealing with complex situations, or with individuals who are larger, stronger and more skilled than they themselves are. It is in the process of such learning that children arrive at substitute techniques of indirect, disguised aggression which are tolerated or encouraged by their elders. The most prominent representatives of this group are (1) attention getting, (2) identification, (3) compensation, (4) rationalization and (5) projection.

Attention getting—This technique reduces the tensions of need or anxiety by making the reacting individual the focus of other persons' behaviour. In the form of crying, it develops so early in life that it illustrates clearly the fact that, to be effective, a mechanism need not be planned, recognized or understood by the person using it. The infant's crying is at first merely one component of a vigorous general response to internal or external stimulation, and not a call for help. Its success in bringing relief and comfort, however, makes it the most likely component to persist as the habitual response to any need or anxiety. If crying is consistently rewarded with attention throughout infancy and childhood, it will continue to be a preferred mechanism of defense against all frustration and threat. Similar conditions of learning account in part for persistent breath-holding, thumb sucking, enuresis, slow eating and rejection of food. In older children, adolescents and adults the attention-getting techniques show increased variety and complexity, but the general principles of their development are much the same. Among the commonest patterns are grimacing, asking questions endlessly, boasting, showing off, complaining, nagging, talking roughly, obscenely or oddly, lying, stealing and extravagant giving.

Identification—The mechanism of identification reduces tensions by enabling an individual to react to the characteristics, status, possessions and achievements of other individuals, or groups, as though these were also his own, and to react to objects and symbols as if he shared in the qualities attributed to them. Young children, for example, may gain security and prestige by identifying with a parent, a sibling or a prominent relative or acquaintance. Older children, adolescents and adults identify with the gang, school, clubs, minority and majority groups, and civic or regional aggregations.

Compensation—This technique reduces tensions by substituting some other need-satisfaction sequence for the one that is frustrated or induces anxiety. When a taboo or socially discredited need-satisfaction sequence is directly replaced by a socially approved one, the compensatory substitution is often called sublimation. Like the other mechanisms, compensation plays an important part in the development and maintenance of social institutions, and like them also its consequences may be harmful as well as beneficial to the individual developing it.

Rationalization—The rationalizing person reduces tensions by attributing to his behaviour socially approved motives which

cannot be substantiated by an impartial analysis. Rationalization has constructive value in protecting a person from the over-scrupulous investigation of all his motives, and in this respect acts as a buffer against guilt reactions. It may have detrimental effects, however, when it leads to self-deception in relation to socially or personally significant behaviour.

Projection—In projection, a person reduces tensions by attributing his own motives, intentions, characteristics or attitudes to someone else. If he merely assumes that others must be as he is, we speak of assimilative projection, but if he disclaims what he attributes to another, we speak of disowning projection. Both varieties are found in all normal persons, and both are important in delusional and hallucinatory developments.

Passive Defense Mechanisms—Direct withdrawal or flight in the face of threat and frustration, like direct aggression, has limited usefulness as an adjustive technique under the conditions of adult social organization. The young child finds flight a relatively inadequate reaction to the aggressions and encroachments of older persons, who are superior to him in strength, agility and skill. This leads him to develop and use more indirect, substitute procedures for avoidance and escape. The most prominent representatives of the passive defense mechanisms are (1) seclusiveness or insulation, (2) negativism, (3) regression, (4) repression and (5) phantasy.

Seclusiveness or Insulation—This technique reduces tensions by rendering the individual or his behaviour relatively inaccessible to the reactions of others. It is often no more than an extension of the hiding or shrinking responses which frightened animals and young children show when they cannot flee. Common examples of seclusiveness or insulation are seen in children who prefer to play alone, in adolescents who remain haughty and aloof in the presence of the opposite sex and in adults who choose vocations and avocations that minimize the necessity for human relationships.

Negativism—Negativism reduces tensions by providing reactions opposed to those which a situation demands, thus making participation impossible. Its clearest examples appear in the "age of resistance,"

tated by illness, injury or imprisonment.

Repression—This is the technique of preventing or inhibiting the development of a tension-provoking reaction in the presence of previously adequate stimulation. It is an extension of the exclusion of distracting and disturbing responses which is an essential part of all learning and recall. To result in normally adjustive behaviour, repression must be reasonably complete, must not require a disproportionate expenditure of effort or time, and must not lead to serious impoverishment or distortion of personality organization.

Phantasy—This defense mechanism reduces tensions by restricting one's behaviour to more or less stereotyped daydreams. The child or

DEFERRED ANNUITY

DEFERRED ASSETS,

are not properly chargeable to the current accounting period. The charging of such items to current operating costs is deferred until the period arrives to which they are applicable. The premium, for example, on an insurance policy may be paid one year in advance. In addition to unexpired insurance, the other common de-

ferred assets are advertising paid in advance, development expense, moving expense and organization expense. With such items as insurance and advertising, the problem of prorating costs is relatively simple, with such items as development, moving and organization expenses, the problem becomes more involved.

DEFFAND DE LA LANDE, MARIE ANNE DE

VICHY-CHAMROND, MARQUIS DU (1697-1780), a celebrated Frenchwoman, was born at the chateau of Chamrond of a noble family on Dec. 25, 1697. Educated at a convent in Paris, she showed a sceptical and cynical turn of mind which led the abbot to arrange that Massillon should reason with her, but he accomplished nothing. She was married at 21 to her kinsman, Jean Baptiste de la Lande, marquis du Deffand, but they were separated as early as 1722. Mme du Deffand, young and beautiful, is said by Horace Walpole to have been for a short time the mistress of the regent, the duke of Orleans (Walpole to Gray, Jan. 25, 1766). In 1721 began her friendship with Voltaire, but their regular correspondence dates only from 1736. She spent much time at Seaux at the court of the duchesse du Maine, where she formed a close friendship with the president Charles Henault (qv). In Paris she was in a sense the rival of Mme Geoffrin, but the members of her salon were drawn from aristocratic society more than from literary circles, though Voltaire, Montesquieu, Fontenelle and Mme de Staël Delaunay were among the habitués. When Henault introduced D'Alembert, Mme du Deffand was at once captivated by him. With the other encyclopaedists she was never in sympathy, and appears to have tolerated them only for his sake. When she lost her sight in 1754 she engaged Mlle de Lespinasse to help her in entertaining. This lady's wit and charm made some of the guests, D'Alembert among others, prefer her society to that of Mme du Deffand, and she arranged to receive her friends for an hour before the appearance of her patron. When this state of things was discovered Mlle de Lespinasse was dismissed (1764), but the salon was broken up, for she took with her D'Alembert, Turgot and the literary clique generally. From this time Mme du Deffand rarely received any literary men. The principal friendships of her later years were with the duchesse de Choussol and with Horace Walpole. Her affection for the latter, which dated from 1765, was the most durable of all her attachments. Under the stress of this tardy passion she developed qualities of style and eloquence of which her earlier writings had given little promise. In the opinion of Sainte-Beuve the prose of her letters ranks with that of Voltaire as the best of that classical epoch. Walpole refused at first to acknowledge the closeness of their intimacy from fear of the ridicule attaching to her age, but he paid several visits to Paris expressly for the purpose of enjoying her society, and maintained a close and most interesting correspondence with her for 15 years.

She died on Sept. 23, 1780, leaving her dog Tonton to the care of Walpole, who was also entrusted with her papers. Of her innumerable witty sayings the best known is her remark on the cardinal de Polignac's account of St. Denis's miraculous walk of two miles with his head in his hands—*Il n'y a que le premier pas qui coûte*. (It is only the first step which costs.)

The *Correspondance inédite* of Mme du Deffand with D'Alembert, Henault, Montesquieu, and others was published in 2 vol. (1809). In 1820 Mary Berry edited *Letters of the Marquise du Deffand to the Hon. Horace Walpole, afterwards earl of Orford, from 1766 to 1784* (4 vol.), and gave numerous extracts from Walpole's letters to Mme du Deffand, since destroyed. In 1912 Mrs. Paget Toynbee published in 3 vol. *Lettres de Mme du Deffand à Horace Walpole*, with 18 of the supposedly lost letters from Walpole. Her letters were also edited by M. de Lescure in *Correspondance complète de la marquise du Deffand* (1865), and by the marquis de Ste. Aulaire in *Correspondance inédite*, etc. (1859 and 1866). See also Sainte-Beuve, *Causeries du Lundi*, vol. 1 and xiv (1852-62), L. Percy, *Le président Henault et Mme du Deffand*, 4th ed. (1893), P. de Ségur, *Esquisses et recits Mme du Deffand et sa famille* (1908), Claude Ferval (Marguerite Amery de Pierrebourg), *Madame du Deffand* (Paris, 1933), Gaston Rageot, *Madame de Deffand* (Paris, 1937). Warren Hunting Smith published *Letters to and from Madame du Deffand and Julie de Lespinasse* (1938), and W. S. Lewis and W. H. Smith edited *Horace Walpole's correspondence with Madame du Deffand and Warrt*, 3 vol. (1939).

DEFIANCE, a city of northwestern Ohio, U.S., at confluence of Auglaize and Tiffin rivers with the Maumee, county seat of Defiance county, on federal highway 24 and five state highways, and is served by Baltimore and Ohio and Wabash railways, bus and truck freight lines. Pop. (1950) 11,270 (federal census). It is the central market of the Maumee valley, a rich dairying and farming region. Manufactures include machine tools, radio condensers, metal stampings, screw machine products, commercial refrigeration, dairy products, luncheon meats, beer, gray iron castings, glass fibre items, service station equipment and mechanics' tools. It is the seat of Defiance college (Christian), established as a normal school in 1884. The confluence of the rivers was a favourite meeting place of the Indians. In 1794 Gen. Anthony Wayne built a fort (which he named Defiance) on a spot now included in a public park. Fort Winchester was built by Gen. Harrison there during the War of 1812. The town was incorporated as a village in 1836. It developed commercially after the opening of the Miami and Erie canal (1845), was made the county seat in that year, and became a city in 1882.

DE FILIPPI, FILIPPO (1869-1938), Italian scientist and explorer, was born in Turin April 6, 1869. After graduating in medicine at the Turin University, he became assistant in the surgical clinic and lecturer in operative surgery in the University of Bologna. He published a number of important papers on physiological and biological chemistry. In 1897 he went with the Duke of the Abruzzi to Alaska as scientific observer and ascended Mount St. Elias. Although he did not accompany the Duke to the Ruwenzori in Central Africa in 1906, De Filippi wrote the report of the expedition. In 1909 De Filippi joined the Duke's expedition to the Western Himalaya and Karakoram Mts., where a point 24,600 ft. high was reached on a ridge of the Bride Peak close to K2, which established a record of altitude unsurpassed until the exploits on Mount Everest (1922 and 1924). He later (1913-14) organized and led an important scientific expedition to the Karakoram range in Central Asia, under the auspices of the Indian and Italian Governments. He died Sept. 23, 1938.

He published *The Ascent of Mount St. Elias* (1900), *Ruwenzori* (1909), *Karakoram and Western Himalaya* (2 vol. 1912), *Storia della spedizione scientifica italiana nel Himalaya, Karacorum e Turchestan Cinese, 1913-1914* (1924), and *Ippolito Desideri di Pistoia, S.J. His Travels and Account of Tibet, 1712-27* (1931 and 1937).

DEFINITION, a logical term used popularly for the process of explaining, or giving the meaning of, a word, and also in the concrete for the proposition or statement in which that explanation is expressed (Lat. *definitio*, from *de finire*, to set limits to, describe). In logic, definition consists in determining the qualities which belong to given concepts or universals, it is not concerned with individuals, which are marked by an infinity of peculiarities, any one or all of which might be predicated of another individual. Individuals can be defined only in so far as they belong to a single kind. According to Aristotle, definition is the statement of the essence of a concept, that is, it consists of the genus and the differentia. In other words, "man" is defined as "animal" and "rational," or "rational animal," i.e., the concept is (1) referred to the next higher genus, and (2) distinguished from other modes in which that genus exists, i.e. from other species. "Rational animal" is thus the predicate of the statement constituting the definition. Sometimes the word "definition" is used to signify merely the predicate. It is sometimes argued that, there being no definition of individuals as such, definition is of names (see J. S. Mill, *Logic* I viii §5), not of things, it is generally however, maintained that definition is of things, regarded as, or in so far as they are, of a kind. Definition of words can be nothing more than the explanation of terms such as is given in a dictionary.

The following rules are generally given as governing accurate definition: (1) *The definition must be equivalent or commensurate with that which is defined*, it must be applicable to all the individuals included in the concept and to nothing else. Every man, and nothing else, is a rational animal. "Man is mortal" is not a definition, for mortality is predicable of irrational animals. (2) *The definition must state the essential attributes*, a concept cannot be defined by its accidental attributes, those attributes must be given which are essential and primary. (3) *The definition must*

be per genus et differentiam, as we have already seen. These are the important rules. Three minor rules are: (4) *The definition must not contain the name of the concept to be defined*, if it does, no information is given. Such a proposition as "an archdeacon is one who performs archidiaconal functions" is not a definition. Concepts cannot be defined by their correlatives. Such a definition is known as a *circulus in definiendo*. (5) *Obscure and figurative language must be avoided*, and (6) *Definitions must not be in the negative when they can be in the affirmative*.

Definition *per genus et differentiam* is a concise description of what a certain kind of thing is. There is another kind of definition, known as *genetic definition*, which describes how the kind of thing in question can be produced. Some terms can be defined in both ways, e.g., the term *circle* may be defined as "a plane curve every point of which is equidistant from a certain point called the centre," or as "a plane curve produced by moving a point at a constant distance from another point." Many chemical formulae are really genetic definitions.

DEFLATION. A diminution of the volume of currency, causing a rise in the value of money per unit and a fall in prices. Its effect varies with the degree of inflation which preceded it and which it is concerned to reduce. For a full discussion see *INFLATION AND DEFLATION, MONEY*.

DEFOE, DANIEL (c. 1659-1731), English author, was born in the parish of St. Giles, Cripplegate, London, in the latter part of 1659 or early in 1660, of a Nonconformist family. His father James Foe, was a butcher and a citizen of London. Until late in life Daniel signed Defoe or Foe indifferently.

Daniel was educated at a famous dissenting academy, Mr. Charles Morton's of Stoke Newington, where many of the best-known Nonconformists of the time were his schoolfellows. He joined Monmouth's rebellion in 1685, and is supposed to have owed his lucky escape from the law to his being a Londoner, and therefore a stranger in the west country. Before his western escapade he had taken up the business of hosiery factor, and had married Mary Tuffley, by whom he had seven children. At the entry of William and Mary into London he is said to have served as a volunteer trooper "gallantly mounted and richly accoutred." At this period he seems to have been a sort of commission merchant, especially in Spanish and Portuguese goods, and at some time to have visited Spain on business. In 1692 he failed for £17,000. Although his creditors accepted a composition, he afterwards honourably paid them almost in full, a fact attested by not very friendly witnesses. He then became secretary and afterwards manager and chief owner of some tile works at Tilbury, but here also he was unfortunate, and his imprisonment in 1703 brought the works to a standstill, and he lost £3,000. About the middle of the reign of William III he was introduced to the King, and in 1695 he was appointed accountant to the commissioners of the glass duty, an office which he held for four years. At this time he produced his *Essay on Projects* (1698), containing remarkable suggestions, much in advance of his time, on banks, road management, friendly and insurance societies of various kinds, debt asylums, bankruptcies, academies, military colleges, high schools for women, etc. In the same year he wrote the first of a long series of ingenious pamphlets on the then burning question of occasional conformity. He argued that the conscience of the Dissenters should not permit them to conform, yet he denounced the impolicy of requiring tests as ill in support of the government he published in 1693 *An Argument for a Standing Army*, followed in 1700 by a defence of William's war policy called *The Two Great Questions considered*, and 1701 of pamphlets on the partition treaty. *The True Born Englishman* (1701) is a satire in rough but extremely vigorous verse on the national objection to William as a foreigner, and on the claim of purity of blood for a nation of mixed origin. He also took part in the proceedings which followed the Scottish petition, and was the author, some say the presenter, of the *Leijon Memorial*, which asserted the supremacy of the electors or the elected. The theory of the indefeasible supremacy of the monarchs of England was one of Defoe's favourite political topics, and he returned to it in a powerfully written tract entitled *The Original Power of the Collective*

Body of the People of England examined and asserted (1701)

In an evil hour for himself Defoe wrote the anonymous *Shortest Way with the Dissenters* (1702), a statement in the most forcible terms of the extreme "high-flying" position, which some high churchmen were unwary enough to endorse, without any suspicion of the writer's ironical intention. The author was soon discovered, and the advertisement offering a reward for his apprehension gives the only personal description we possess of him, as "a middle-sized spare man about forty years old, of a brown complexion and dark brown-coloured hair, but wears a wig, a hooked nose, a sharp chin, grey eyes, and a large mole near his mouth." In this conjuncture Defoe had really no friends, for the Dissenters had already been annoyed by his rather caustical tracts on the question of occasional conformity, and were as much alarmed at his book as the high-flyers were irritated. He was fined (Feb. 24, 1703) 200 marks, and condemned to be pilloried three times, to be imprisoned indefinitely, and to find sureties for his good behaviour during seven years. It was in reference to this incident that Pope, whose Catholic rearing made him detest the abettor of the Revolution and the champion of William of Orange, wrote in the *Dunciad*—

Earless on high stands unabash'd Defoe

—though he knew that the sentence to the pillory had long ceased to entail the loss of ears. Defoe's exposure in the pillory (July 20, 30, 31) was, however, rather a triumph than a punishment, for the populace took his side, and his *Hymn to the Pillory* is one of the best of his writings in verse. Unluckily for him his condemnation had the indirect effect of destroying his business at Tilbury.

He remained in prison until Nov. 1, 1704, and then owed his release to the intercession of Robert Harley, who represented his case to the queen, and obtained for him not only liberty but pecuniary relief and employment, which, of one kind or another, lasted until the termination of Anne's reign. There is no doubt that Harley, who understood the influence wielded by Defoe, made some conditions. Defoe says he received no pension, but his services were certainly rewarded, and he was a secret agent of the government in 1706 and 1707 in Scotland, working in favour of the Union. In this case he was employed by Godolphin, to whom Harley had recommended him. He wrote in prison many short pamphlets, chiefly controversial, published a curious work on the famous storm of the 26th November, 1703, and started in February 1704 *The Review*. This was a paper which was issued during the greater part of its life three times a week. It was entirely written by Defoe, and extends to eight complete volumes and some few score numbers of a second issue. He did not confine himself to news, but wrote something very like finished essays on questions of policy, trade and domestic concerns; he also introduced a "Scandal Club," in which minor questions of manners and morals were treated in a way which undoubtedly suggested the *Tatlers* and *Spectators* which followed. Only one complete copy of the work is known to exist, and that is in the British Museum. After his release Defoe went to Bury St. Edmunds, though he did not interrupt either his *Review* or his occasional pamphlets. One of these, *Giving Alms no Charity, and Employing the Poor a Grievance to the Nation* (1704), is extraordinarily far-sighted. It denounces both indiscriminate alms giving and the national work shops proposed by Sir Humphrey Mackworth.

In 1705 appeared *The Consolidator, or Memoirs of Sundry Transactions from the World to Moon*, a political satire which is supposed to have given some hints for Swift's *Gulliver's Travels*, and at the end of the year Defoe performed a secret mission, the first of several of the kind, for Harley. In 1706 appeared the *True Relation of the Apparition of one Mrs. Veal*, an excellent example of Defoe's skill as a special reporter. In the course of his service in Scotland he wrote his *History of the Union*, which appeared in 1709. In this year Henry Sacheverell delivered his famous sermons, and Defoe wrote several tracts about them and attacked the preacher in his *Review*.

In 1710 Harley returned to power, and Defoe was placed in a somewhat awkward position. He seems, in fact, to have agreed

with the foreign policy of the Tories and with the home policy of the Whigs, and naturally incurred the reproach of time serving and the hearty abuse of both parties. At the end of 1710 he again visited Scotland. In the negotiations concerning the Peace of Utrecht, Defoe strongly supported the ministerial side, to the intense wrath of the Whigs, displayed in an attempted prosecution against some pamphlets of his on the all important question of the succession. Again the influence of Harley saved him. He continued, however, to take the side of the Dissenters in the question affecting religious liberty. He naturally shared Harley's downfall, and, though the loss of his salary might seem a poor reward for his constant support of the Hanoverian claim, it was little more than his ambiguous, not to say trimming, position must have led him to expect.

Defoe declared that Lord Annesley was preparing the army in Ireland to join a Jacobite rebellion, and was indicted for libel, and prior to his trial (1715) he published an apology entitled *An Appeal to Honour and Justice* which is one of the chief sources for the facts of his life. He was convicted, but was liberated later in the year under circumstances that only became clear in 1864, when six letters were discovered in the Record Office from Defoe to a government official, Charles Delafaye, which, according to William Lee, established the fact that in 1718 at least Defoe was doing political work of an equivocal kind—that he was sub-editing the Jacobite *Mist's Journal* under a secret agreement with the government that he should tone down the sentiments and omit objectionable items. He had, in fact, been released on condition of becoming a government agent. He seems to have fulfilled similar functions in *Dormer's Letter* and the *Mercurius Politicus*.

The first volume of Defoe's most famous work, the immortal story—partly adventure, partly moralizing—of *The Life and Strange Surprising Adventures of Robinson Crusoe*, was published on April 25, 1719. It ran through four editions in as many months, and then in August appeared the second volume. Twelve months afterwards the sequel *Serious Reflections*, now hardly ever reprinted, appeared. The first two parts were reprinted as a *feuilleton* in *Heathcote's Intelligencer*, perhaps the earliest instance of the appearance of such a work in such a form. The story was founded on Dampier's *Voyage round the World* (1697), and still more on Alexander Selkirk's adventures, as communicated by Selkirk himself at a meeting with Defoe at the house of Mrs. Damans Daniel at Bristol. Selkirk afterwards told Mrs. Daniel that he had handed over his papers to Defoe. *Robinson Crusoe* is one of the world's classics in fiction. Crusoe's shipwreck and adventures, his finding the footprint in the sand, his man "Friday," are all imitatively told, but it is the conception of civilized man alone face to face with nature which has made Defoe's great work an imperishable part of world literature. In the same year appeared *The Dumb Philosopher, or Dickory Cronke*, who gains the power of speech at the end of his life and uses it to predict the course of European affairs.

In 1720 came *The Life and Adventures of Mr. Duncan Campbell*. This was not entirely a work of imagination, its hero, the fortune-teller, being a real person. There are amusing passages in the story, but it is too desultory to rank with Defoe's best. In the same year appeared two wholly or partially fictitious histories, each of which might have made a reputation for any man. The first was the *Memoirs of a Cavalier*, which Lord Chatham believed to be true history. *Captain Smgleton*, the last work of the year, has been unjustly depreciated by most of the commentators. The record of the journey across Africa, with its surprising anticipations of subsequent discoveries, yields in interest to no work of the kind.

In 1721 nothing of importance was produced, but in the next year three works of capital importance appeared. These were *The Fortunes and Misfortunes of Moll Flanders*, *The Journal of the Plague Year*, and *The History of Colonel Jack*. *Moll Flanders* still ranks among the great English novels, and deserves far more notice than it has usually received.

The Journal of the Plague Year, more usually called, from the title of the second edition, *A History of the Plague*, reads like a

contemporary record. No one had the imaginative power necessary to create circumstantial detail in a greater measure than Defoe, and there is no more reason to presuppose documentary basis than in the case of *Moll Flanders*. Defoe was able to make all his narratives appear true stories, and he was gifted in a high degree with historical imagination. *The History of Colonel Jack* is an unequal book, and the end of the story is less good than the beginning.

To this period belong his stories of famous criminals, of Jack Sheppard (1724) of Jonathan Wild (1725) of the Highland Rogue, &c., Rob Roy (1733). The pamphlet on the first of these Defoe maintained to be a transcript of a paper which he persuaded Sheppard to give to a friend at his execution.

In 1724 appeared also the first volume of that admirable guide, *A Tour through the whole Island of Great Britain*, which was completed in the two following years. In 1725 appeared *A New Voyage round the World*, apparently entirely due to the author's own fertile imagination and extensive reading. It has all the interest of Anson's or Dampier's voyages.

Towards the end of 1726 appeared *The Complete English Tradesman*, which called forth the scorn of Charles Lamb. To 1726 also belongs *The Political History of the Devil*. This belongs to a series of demonological works, of which the chief others are *A System of Magic* (1726), and *An Essay on the History of Apparitions* (1728), issued the year before under another title. *A Plan of English Commerce*, containing very enlightened views on export trade, appeared in 1728.

During the years 1715-28 Defoe had issued a formidable array of pamphlets and minor works which cannot be enumerated here. No man can ever have written more continuously. He must in some way or other have obtained a considerable income. In 1724 he had built himself a large house at Stoke Newington, and he had obtained on lease in 1722 a considerable estate from the corporation of Colchester, which was settled on his unmarried daughter at his death. He died in Ropemaker's Alley, Moorfields, on April 26, 1731, and was buried in Bunhill Fields. He left no will, all his property having been previously assigned, and letters of administration were taken out by a creditor. How his affairs fell into this condition, why he did not die in his own house, and why in the previous summer he had been in hiding, as we know he was from a letter still extant, are points not clearly explained. In 1724 he was, however, attacked by Mist, who was disarmed and wounded (May 18) imprisoned. It is more likely that Mist had found out that Defoe was a government agent and quite probable that he thus informed other editors, for Defoe's journalistic employment almost ceased about this time, and he began to write anonymously, or as "Andrew Moreton." Mist had escaped to France, and may have designed revenge on Defoe. It is possible that he had to go into hiding to avoid the danger of being accused as a real Jacobite, when those with whom he had contracted to assume the character were dead.

Colonel Jack, *The Cavalier*, *Duncan Campbell*, *The Plague*, *Everybody's Business*, *Mrs. Veal*, *The Shortest Way with Dissenters*, *Guiney Alms no Charity*, *The True-Born Englishman*, *Hymns to the Pillory*, and very copious extracts from *The Complete English Tradesman*. An edition of Defoe's *Romances and Narratives* in sixteen volumes by G. A. Aitken came out in 1895. *The Selected Writings of Daniel Defoe* (12 vols.), were published by Blackwell, 1907.

The reprints and editions of *Crusoe* have been innumerable, it has been often translated, and the eulogy pronounced on it by Rousseau gave it special currency in France, where imitations (or rather adaptations) have also been common.

See also John Forster, *Historical and Biographical Essays* (1858), G. Saintsbury, "Introduction" to Defoe's *Minor Novels*, and valuable notes by G. A. Aitken in *The Contemporary Review* (February 1890) and *The Athenaeum* (April 30, 1889, August 31, 1890). Dr. Karl T. Baumbach edited two unpublished works of Defoe, *The Compleat English Gentleman* (1890) and *Of Royal Education* (1905), from British Museum Add. MS. 32,355. Further light was thrown on Defoe's work as a political agent by the discovery (1906) of an unpublished paper of his in the British Museum by G. F. Warner. This was printed in the *English Historical Review*, and afterwards separately.

DE FOREST, LEE (1873—), U.S. inventor, was born at Council Bluffs, Ia., Aug. 26, 1873, graduated from Yale Sheffield Scientific school in 1896 and received his Ph.D. in 1899. Almost immediately he started his career of invention and the promotion of radio communication or wireless as it was then called.

Soon the De Forest Wireless Telegraph company was organized but after several years it failed. Primarily an individualistic experimenter and inventor, De Forest next spent several years on the important problem of devising a sensitive detector for the reception of radio waves. This work culminated in 1906 in the invention of the audion, the elementary form of the modern radio tube. Slowly the usefulness of these tubes as generators, amplifiers and detectors of radio waves was established. However, it was not until the radio communication needs of World War I arose that the audion, by then improved by the work of others, became an invaluable engineering device and was manufactured in large quantities.

In 1910 De Forest transmitted the singing voice of Enrico Caruso and thus was one of the pioneers of radio broadcasting. His many patents included the phonofilm,

an early development in the field of talking motion pictures. He was honoured by medals and awards from several learned societies and served as president of the Institute of Radio Engineers.

(W. C. Wix)

DEFREGGER, FRANZ VON (1835-1921), Austrian genre painter, was born in Dolsach, in Tyrol, on April 30, 1835, in the old farm house Ederhof zu Stronach. He spent his youth amid the mountains as a farm labourer, and on the death of his father took over the farm, at the age of 23. Two years later he sold his farm, meaning to go to America, but eventually went to Innsbruck to study drawing and carving, to which he was devoted from his boyhood. His teacher, Franz Stolz, took him to Munich in 1861. In 1863 he went to Paris, and returning to Munich, studied under Piloty for five years. His pictures, representing the rustic life of the Tyrolese, and the struggle of Tyrol, under Andreas Hofer, for freedom from foreign yoke, met with success from the first. They made their appeal by the subject-matter. Among his best known works are the "Speckbacher" (1866) at the Ferdinandeum, Innsbruck, the "Wrestlers" (1870), the "Dancers" (1871), the "Return of the Victors" (1876). He is represented in most German museums and also in the Metropolitan Museum of Art, New York.

DEGAS, HILAIRE GERMAIN EDGAR (1834-1917), French painter, was born in Paris on July 19, 1834 and died there

THE ORIGINAL AUDION INVENTED BY DE FOREST. The audion by regulating the amount of current that passes and magnifying feeble currents is of vital importance to long distance telephony and radio.

on Sept. 27, 1917. He studied under Lamoignon and Ingres at the Ecole des Beaux Arts, and first exhibited in the Salon of 1865, contributing a "War in the middle ages," a work executed in pastel. To this medium he was ever faithful, using it for some of his best work. But he soon turned to subjects from contemporary life. He exhibited "Steeplechase" (1866), "Family Portraits" (1867) and a portrait of a dancer in the "Ballet of La Source" (1868). In 1869 and 1870 he restricted himself to portraits, but thenceforward he abandoned the salons and attached himself to the Impressionists. With Manet and Monet he took the lead of the new school at its first exhibition in 1874, and repeatedly contributed to these exhibitions (in 1876, 1878, 1879 and 1886). In 1868 he had shown his first study of a dancer, and in numerous pastels he proclaimed himself the painter of the ballet. He painted innumerable studies of dancers, showing an amazing mastery of drawing and of light. Several of his works may be seen at the Luxembourg Gallery, to which they were bequeathed among a collection of impressionist pictures by M. Caillebotte. In 1880 Degas showed his powers of observation in a set of "Portraits of Criminals," and he attempted modelling in a "Dancer," in wax. He afterwards returned to his studies of the sporting world, exhibiting in Dec. 1884 at the Petit Gallery two views of "Races" which had a great success, proving the increasing vogue of the artist among collectors. At the eighth Impressionist Exhibition, in 1886, Degas continued his realistic studies of modern life, showing drawings of the nude, of workwomen, and of jockeys. Besides his pastels and his paintings of genre and portraits—among these, several likenesses of Manet—Degas also handled his favourite subjects in etching and in aquatint, and executed several lithographs of "Singers at Cafés-concerts," of "Ballet-girls," and indeed of every possible subject of night-life and incidents behind the scenes. His work is to be seen not only at the Luxembourg but in many of the great private collections in Paris, in England and America. In the Centenary Exhibition of 1900 he exhibited "The Interior of a Cotton-Broker's Office at New Orleans" and "The Rehearsal."

DE GEER, JONKHEER DIEK JAN (1870–), Dutch statesman, was born on Dec. 14, 1870, and graduated doctor at Groningen. He was a barrister and a journalist by profession. Entering the second chamber in 1907, he became one of the leaders of the Christian Historical Union. He was burgomaster of Arnhem (1920–22), finance minister (1921–23), and in March 1926 became prime minister, retaining for himself the portfolio of finance. The new Government put forward a moderate program of retrenchment, disarmament, and the promotion of native participation in the government of the East Indies. In August 1939 de Geer again became premier.

DE GEER, LOUIS GERHARD, BARON (1818–1896), Swedish statesman and writer, was born on July 18, 1818, at Finspång castle. In 1855 he became president of the Gota Hofret, or lord justice of one of the Swedish supreme courts. From 1858–70 he was minister of justice. His greatest achievement was the reform of the Swedish representative system, whereby he substituted a bicameral elective parliament, on modern lines, for the existing cumbersome representation by estates, a survival from the later middle ages. This great measure was accepted by the *Riksdag* in Dec. 1865, and received the royal sanction on June 22, 1866. He retired from the ministry in 1870, but took office again, as minister of justice, in 1875. From 1876–80 he was minister of State, and from 1881–88 chancellor of the universities of Uppsala and Lund.

Besides several novels and aesthetic essays, De Geer wrote political memoirs of supreme merit both as to style and matter, the most notable of which are *Minnesteckning öfver A. J. v. Hopken* (1881), *Minnesteckning öfver Hans Järta* (1874), *Minnesteckning öfver B. B. von Platen* (1886), and his own *Minnen* (1892), an autobiography, invaluable as a historical document. See *Sveriges historia* (1881, etc.), vi, Carl Gustaf Malmström, *Historiska Studier* (1897), C. Arcadius, *Löns de Geer* (1906).

DEGENERATION This term is loosely used in diverse ways in biology. It was applied by Sir Edwin Ray Lankester to an evolutionary change in the direction of simplification. Degenerative or, better, retrogressive evolution may be said to have taken place in those plants or animals in which a presumed ancestral organ or part is greatly reduced or even lacking. In a modern bird, to use a familiar example, whose beak performs the office of the teeth in other animals, no vestige of a tooth occurs. Yet it was otherwise in many ancient birds, such as *Hesperornis* and *Ichthyornis* (q.v.), known to us only from their fossilized skeletons, their jaws were well provided with abundant conical teeth. The weight of evidence leads us to conclude that the dentition of birds has been lost in the course of their evolution. The fossil record tells a similar story about other toothless forms, e.g., the sturgeon among fishes, toads, turtles, egg-laying mammals, anteaters and whalebone whales. So is it also with fins and limbs which were primitively present as two pairs, fore and hind (pectoral and pelvic), in ancestral vertebrates. Most of the modern forms have retained both pairs of appendages but others in supposed adaptation to specialized habits have lost one or both sets of limbs as in the eels, the limbless coelocans (burrowing amphipods), numerous lizards and the entire group of snakes. In all of the above there has been a considerable elongation of the body and, necessarily, changes in the mode of locomotion. In whales (see CETACEA), the most highly modified of the secondarily aquatic animals, the forelimbs have been returned as flippers, while the hind pair is represented by small paired remnants of the hip bone deeply buried in the flesh. An analogous but less extensive degeneration is exemplified in flightless birds (ostrich, cassowary, kiwi, etc.) in which the wing, although typically formed, is reduced to such an extent that it does not suffice for flight.

Among the best examples of degeneration correlated with environment are cave animals. Independently and in widely scattered regions such diverse inhabitants of caves as crayfish, spiders, beetles, grasshoppers (cave crickets), fish and salamanders are blind as a result of the reduction or loss of the eyes and colourless owing to the reduction of pigment.

Although the examples above have been chosen from more familiar forms, it should be pointed out here that degeneration in evolution is a very general process. Most highly developed organisms have lost some organs, modified and elaborated others and developed some entirely unrepresented in the ancestral stocks (see EVOLUTION, ORGANIC and article by Emerson cited below).

If we grant that such retrogression has taken place, we are faced with the question of the means by which it was effected. Charles Darwin thought that the initial reduction in an organ might be brought about by disuse (a view which has received no recent support), but he realized the logical difficulty of calling on disuse to produce any further changes "after the organ had once been rendered functionless." The current concepts of selection (q.v.) suggest that in the absence of selection pressure favouring the maintenance of an organ (e.g., an eye in a cave animal) gene mutations which degrade the structure may proceed unchecked, particularly if the effect of the mutations be favourable in respect to other organs.

The process of degenerative evolution has gone furthest in parasites, such as tapeworms and the remarkable parasitic crustacean, *Saccus*, among others (see PARASITOLOGY).

ment is well-illustrated in the metamorphosis of insects (Diptera, Hymenoptera, etc.), where there is extensive destruction of the larval cells followed by the reconstruction of the adult on a new plan. Analogous processes occur in other kinds of metamorphosis, as in the ptilinum larva of nemertines and the pluteus larva of sea urchins. The dissolution of the tail in the tadpole is a more localized change. During fetal life in higher vertebrates, the notochord is largely lost, the cartilage of the provisional skeleton is in large part dissolved to make way for the deposition of bone, the paired embryonic kidneys (mesonephros) rapidly waste away, the duct system of each being salvaged in males to serve as *ductus deferens* and epididymis, but withering to functionless rudiments in the female. The Mullerian ducts

(oviducts), well developed in the embryos of both sexes, continue to grow in females, but become vestigial in the male. These developmental alternatives have provided an ideal object for the investigation of causal relationships in degeneration by means of hormone (qv) treatment or transplantation of organs later to degenerate. The mesonephros of a chick, for example, has been shown to degenerate at the proper time when transplanted quite regardless of the age of the host; it seems to carry within itself the seeds of its own dissolution (Vera Danchakoff).

Perhaps to be placed in the same category is the cyclical or continuous regression of the various cells or organs in adults: skin, blood cells, *corpora lutea* in the ovary, the uterine epithelium, etc., in which the parts are regenerated either continuously or periodically as the case may be.

In the third place, particular attention has been directed to senile degeneration, the disappearance of sensory, nerve, muscle and other cells in aging. This is possibly better treated as a phenomenon of pathology (qv) which studies the degenerative changes following disease or accident.

DEGGENDORF or **DECKENDORF**, town of Bavaria, Germany, 25 mi N W of Passau, on the left bank of the Danube, which is there crossed by two iron bridges. Pop. (1930) 11,767. It is at the lower end of the beautiful valley of the Perlbach. The old town hall dates from 1566. The church of the Holy Sepulchre, built in 1337, attracts thousands of pilgrims to its *Porta Coeli* or *Gradenopforte* (Gate of Mercy) opened annually on Michaelmas eve and closed again on Oct. 4. The town is a depot for the timber trade of the Bavarian forest, a station for Danube steamboats and the seat of several mills, breweries, etc. On the bank of the Danube outside the town are the remains of the castle of Fintelstein, and on the Geiersberg (1243 ft.), in the immediate vicinity, stands another old pilgrimage church. About 6 mi N is the village of Metten, with a Benedictine monastery founded by Charlemagne in 801, restored as an abbey in 1840 by Louis I of Bavaria, and well known as an educational institution. The first mention of Deggenndorf occurs in 868, and it appears as a town in 1212. Henry (d. 1296) of the Landshut branch of the ruling family of Bavaria made it the seat of a custom-house, and in 1331 it became the residence of Henry III of Nattenberg (d. 1333). In 1337 a wholesale massacre of the Jews, who were accused of having thrown the sacred host of the church of the Holy Sepulchre into a well, took place in the town, and it is probably from about this date that the pilgrimage above mentioned came into vogue. The town was captured by the Swedish forces in 1633, and in the war of the Austrian Succession it was more than once laid in ashes.

DE GOEJE, MICHAEL JAN. see **GORJE, MICHAEL JAN DE**

DEGREE, a step or stage. In academic usage, a degree is a title conferred by a university as a mark of proficiency in scholarship. The word was first applied to the preliminary steps to the mastership or doctorate, viz., the baccalaureate and baccalaureate. "The use of academic degrees, as old as the 13th century, is visibly borrowed from the mechanic corporations, in which an apprentice, after serving his time, obtains a testimonial of his skill and a license to practise his trade and mystery" (Gibbon, *Autobiography*, 29). Originally, as the words "master" and "doctor" imply, the degree was a certificate of fitness to teach at a university. Degrees in law, medicine and theology still carry with them a license to practise the corresponding professions, but degrees in arts are no more than certificates of a certain measure of acquaintance with the subject. In modern times the practice has arisen of conferring honorary degrees as a recognition of distinction with out regard to academic qualifications. (X)

In general two practices are followed in the award of degrees. The European and South American countries have as a rule retained the degrees of the five traditional faculties: law, medicine, theology, arts and philosophy, and in granting academic recognition for work in newer fields of study have granted the degree of the faculty to which they most nearly approximate. Except in France and Spain all intermediate degrees, such as those of

bachelor and master, have been abolished. In Germany the doctorate of the various faculties is the only one granted, but there is a tendency to add new signatures such as *Dr Phil Nat* or *Dr Rer Nat* in mathematics and sciences and *Dr Ing* or *Dr Rer Techn* in engineering. Except in the faculty of law, where the *baccalaureat* is granted, the usual French degrees are the *licence* and *doctorat* according to the faculties, these are State degrees, to which a *doctorat d'université* has been added recently, carrying with it the recognition of a university but none from the State.

In the British universities Oxford and Cambridge have remained conservative and grant the B.A. as the first degree in most faculties, the B.Sc. and B.Litt. at Oxford are awarded for special research and examination. In 1926 Dublin introduced the B.Sc. for students who do not present a classical language in their examinations. The local universities have been more liberal in adding to the list of degrees although the B.A. and B.Sc., the latter in a great variety of special branches of science and technology, are the first degrees (M.A. in Scotland). The B.Com. in commerce, B.Arch. in architecture and B.Ed. in education are the more recent additions. The second degree is the M.A. or M.Sc., obtained everywhere by examinations except at Oxford and Cambridge where it is granted after a period of residence and payment of the prescribed dues. The doctorate (D.Sc., D.Litt., LL.D., etc.) is available in most branches, but in arts and science is usually awarded on the basis of contributions to knowledge and distinction in some special field. Since World War I an attempt has been made, but without much success, to establish the Ph.D. by examination. The usual degrees are available in medicine, law and theology. In all the universities the first degrees in arts or science may be obtained as an ordinary degree or with honours.

The greatest multiplication of degrees has taken place in the United States. Not only has there been a rapid expansion of specialization in the universities and colleges, but graduation in each specialty is recognized by a distinctive degree. The commonest degrees are still the B.A. and B.S. to which the signature of the special field is added, as B.A. in Ed., or B.S. in Arch. No attempt seems to be made at standardization, thus in business are B.B. in B. and B. (business administration and banking) and B.B.A. (business administration). As soon as a new grouping of subjects takes place, it is designated by its own degree, as B.J. (journalism) or B.S. in AeE (aeronautical engineering). These special fields have their corresponding designations at the more advanced levels, especially the master's degree, and although there is a tendency to retain the Ph.D. as the most advanced degree in arts and science special signatures are found, as Ed.D. (education). An attempt has been made for several years to grant certain degrees, such as L.H.D., D.D., LL.D., Litt.D., and D.C.L., *honoris causa* only. (I. L. K.)

In the science of measurement, degrees are small equal subdivisions of an interval, eg , the interval between the freezing and boiling points of water are divided into equal increments of temperature, the size of these depending on the arbitrary temperature scale chosen (see THERMOMETRY). The angle (qv) through which the radius of a circle turns in completing one revolution is divided into 360 degrees. The subdivisions of density scales are also termed degrees (see HYDROMETRICS). The universal symbol for degree is a small circle at the top right-hand side of the figure denoting the number of degrees, eg , fifteen degrees centigrade is written thus 15°C . The degree as an angular measure is further divided into 60 minutes of arc ($1^{\circ}=60'$).

In mathematics, the degree of an expression is determined by the highest dimensions of its terms, thus $2x^2y+xy$ is an expression of the third degree, the first term, being the product of three variables, x , x and y , has three dimensions and is of higher dimensions than the second which is the product of only two variables (see EQUATIONS, THEORY OF). In dynamics (qv) the expression "degrees of freedom" refers to the number of unique possible directions or modes of motion of a body (see also QUANTUM MECHANICS AND GYROSCOPE).

DEHMEL, RICHARD (1863-1920), German poet, was born in Wendisch Hermsdorf, Brandenburg, on Nov. 18, 1863. He was educated in Kremen, Berlin and Danzig, and in 1882 began

to study philosophy, natural sciences and social economy, and also became editor of a provincial newspaper. From 1887-95 he was secretary of the Union of German Fire Insurance Companies. In 1891 he published his first volume of poetry, *Erlösungen*. This was followed by *Aber die Liebe* (1893), and *Weib und Welt* (1896). From 1899 until 1902 he travelled in Italy, Greece, Switzerland, Holland and England, and afterwards lived in Blankensee, near Hamburg. In collaboration with his first wife, Paula Dehmel, he published some books for children, including *Fitzbutze* (1907). He wrote a novel in lyrical form, *Zwei Menschen* in 1903, the epic composition *Die Verwandlungen der Venus* in 1904 and also dramas and pantomimes. He took part as a volunteer in World War I, and in 1919 published his diary, *Zwischen Krieg und Menschheit*. Among his dramas, *Die Menschenfreunde* (1917) was successful. His *Collected Works*, 10 vol., began publication in 1906. Dehmel's work is characterized by most unusual emotional power. His theme, whether it be erotic or social, awakens in him an intensity of feeling which seeks expression with almost explosive force. Sometimes taste and even sense are swept away in this torrent, on the other hand, Dehmel had a very strong feeling for form and music, and his best pieces, where form and thought have been most successfully welded together, are among the masterpieces of the German lyric. He died at Blankensee, Feb. 8, 1920. See *Selected Letters*, 2 vol. (1922-23), E. Ludwig, *Richard Dehmel* (1913).

DEHRA DUN, a district of British India, in the Meerut division of the United Provinces, with an area of 1,202 sq mi. The Dun proper is a beautiful valley lying between the Siwalik range and the foothills of the Himalayas. The administrative district runs up into the latter and embraces the sanatorium of Mussorie. The mountains in its northern section attain a height between 7,000 and 8,000 ft., one peak reaching an elevation of 8,565 ft., the highest point of the Siwalik range is 3,041 ft. above sea level. The principal passes through the Siwalik hills are the Timli pass, leading to the military station of Chakrata, and the Mohand pass leading to the sanatoriums of Mussorie and Landaur. The Ganges bounds the Dehra Dun valley on the east, the Jumna bounds it on the west. It is well wooded, undulating and relatively temperate in climate. To the east the valley is characterized by swamps and forests, but to the west the natural depressions freely carry off the surface drainage. In 1941 the population was 266,244. A railway to Dehra Dun from Hardwar, on the Oudh and Rohilkhand line (32 mi.), was completed in 1900. The district is served by the Dun canals. Tea gardens cover a considerable area, and the valley contains a colony of European tea planters.

Dehra Dun only emerges from the mists of legend into authentic history in the 17th century A.D., when it formed part of the Garhwal kingdom. Toward the end of the century the heretical Sikh Guru, Ram Rai, expelled from the Punjab, sought refuge in the Dun and gathered a crowd of devotees. Fateh Sah, rajah of Garhwal, endowed the temple which he built, round which grew up the town of Gurudwara or Dehra Dun (q.v.). In the 18th century the fertility of the valley attracted the attention of Najib-ud-daula, governor of Saharanpur, who invaded it with an army of Rohillas in 1757 and annexed it to his dominion. His rule, which lasted till 1770, brought great prosperity to the Dun, but on his death it became a prey to the surrounding tribes, its desolation being completed after its conquest by the Gurkhas in 1803. In 1814 it was taken possession of by the British.

DEHRA DUN, a town of British India, headquarters of the Dehra Dun (q.v.) district in the United Provinces. It lies at an elevation of 2,300 ft., at the terminus of the Hardwar Dehra Dun railway. Dehra Dun is the headquarters of the Trigonometrical survey and of the forest department, besides being a cantonment for a Gurkha force. The Indian Forest college, which trains forest officials for all parts of India, is a fine building. Attached to it is a research institute for the scientific study of silviculture and the exploitation and administration of forests. The Prince of Wales Royal Indian Military college was founded in 1922 to train Indian boys for the Royal Military college at Sandhurst, England, and for the Indian Military academy after the establishment

of that institution at Dehra Dun in 1932.

The town of Dehra Dun grew up round the temple built in 1699 by the heretical Sikh Guru, Ram Rai, the founder of the Udasi sect of Ascetics. This temple is a remarkable building in Mohammedan style. The central block, in imitation of the emperor Jahangir's tomb, contains the bed on which the Guru, after dying at will and coming back to life several times, ultimately died outright, it is an object of great veneration. At the corners of the central block are smaller monuments commemorating the Guru's wives. Pop. of town (1941) 57,183.

DEHYDRATION, in chemistry, the removal of molecules of water from a chemical compound. The water may be present in the form of water of hydration (see **HYDRATE**) in which case it is removed by heating the crystals, or by placing them in an evacuated desiccator in the presence of a drying agent such as phosphorus pentoxide. It may be removed from the molecules of oxyacids and basic hydroxides by similar procedures. Alternatively, water may form part of a molecule of an organic compound, in which case it is frequently removed by heating the compound in the presence of a metallic oxide, which acts as catalyst (see **CATALYSIS**), e.g., depending on the conditions, alcohols may yield either aldehydes or ethers (see **ALCOHOLS**, **ETHERS**, **OLEFINES**).

DEHYDROGENATION, the removal of hydrogen from the molecule of a chemical compound, which may be effected in the case of an organic compound by heating it in the presence of a metal, which acts as a catalyst (see **CATALYSIS**). e.g., the alcohols (q.v.) lose hydrogen and yield aldehydes (q.v.), see also **HYDROGENATION**.

DEINARCHUS, last of the "ten" Attic orators, son of Sostratus (or, according to Suidas, Socrates), born at Corinth about 361 B.C. He settled at Athens early in life, and when not more than twenty five was already active as a writer of speeches for the law courts. In 324 the Areopagus, after inquiry, reported that nine men had taken bribes from Harpalus, the fugitive treasurer of Alexander. Deinarchus wrote, for the prosecution, the three speeches which are still extant—*Against Demosthenes*, *Against Aristogiton*, *Against Philochos*. The sympathies of Deinarchus were in favour of an Athenian oligarchy under Macedonian control, but it should be remembered that he was not an Athenian citizen. In the Harpalus affair Demosthenes was doubtless innocent, and so, probably, were others of the accused. Yet Hyperides, the most fiery of the patriots, was on the same side as Deinarchus. Under the regency of his old master, Demetrius Phalereus, Deinarchus exercised much political influence. On the restoration of the democracy by Demetrius Poliorcetes, Deinarchus was condemned to death and withdrew into exile at Chalcis in Euboea. About 292 B.C., thanks to his friend Theophrastus, he was able to return to Attica. Deinarchus died at Athens about 291.

According to Suidas, Deinarchus wrote 160 speeches, and Dionysius held that, out of 85 extant speeches bearing his name, 58 were genuine—28 relating to public, 30 to private causes. Although the authenticity of the three speeches mentioned above is generally admitted, Demetrius of Magnesia doubted that of the speech *Against Demosthenes*, while A. Westermann rejected all three. Deinarchus had little individual style and imitated by turns Lysias, Hyperides and Demosthenes. He is called by Hermogenes $\delta \kappa \rho \iota \nu \theta \iota \varsigma \Delta \eta \mu \omega \sigma \theta \epsilon \nu \eta \varsigma$, a Demosthenes whose strength is rougher, without flavour or sparkle.

Editions (text and exhaustive commentary) E. Matzner (1842), (text) T. Thalhema (1887), F. Blass (1888), see L. L. Forman, *Index Antiquorum*, *Lycargus*, *Deinarchus* (1897), and, in general, F. Blass, *Attische Beredsamkeit*, in. There is a valuable treatise on the life and speeches of Deinarchus by Dionysius of Halicarnassus.

DEINOCRATES, a famous and original Greek architect of the time of Alexander the Great. He tried to create the ambitious fancy of that king with a design for carving Mount Athos into a gigantic seated statue. This plan was not carried out, but Deinocrates designed for Alexander the plan of the new city of Alexandria, and constructed the vast funeral pyre of Hephaestion. Alexandria was, like Petraeus and Rhodes (see **HIPPODAMUS**), built on a regular plan, the streets of most earlier towns being narrow and confused.

DEIOCES (Δηϊόκης) according to Herodotus (1.96 ff.) the first king of the Medes. He narrates that, when the Medes had rebelled against the Assyrians about 710 B.C., according to his chronology (cf. Diodor., II.32), they lived in villages without any political organization. Then Deioces, son of Phraortes, was chosen judge in his village, and the justice of his decisions induced the inhabitants of the other villages to throng to him. At last the Medes resolved to set up a kingdom, and chose Deioces king. He now caused them to build a great capital, Ecbatana, with a royal palace, and introduced the ceremonial of oriental courts. He united all the Median tribes, and ruled 53 years (c. 699–647 B.C.), though perhaps, as G. Rawlinson supposed, the 53 years of his reign are exchanged by mistake with the 22 years of his son Phraortes.

The narration of Herodotus is only a popular tradition. We know from the Assyrian inscriptions that just at the time which Herodotus assigns to Deioces the Medes were divided into numerous small principalities and subjected to the great Assyrian conquerors. Among these petty chieftains, Sargon in 715 mentions Däyukku, "lieutenant of Man" (the probably was, therefore, a vassal of the neighbouring king of Man in the mountains of south-eastern Armenia), who joined the Urtarians and other enemies of Assyria, but was by Sargon transported to Hamath in Syria "with his clan." His district is called "bit Däyaukkü," "house of Deioces," also in 713, when Sargon invaded these regions again. So it seems that the dynasty, which more than half a century later founded the Median empire, was derived from this Däyukku, and that his name was thus introduced into the Median traditions, which contrary to history considered him as founder of the kingdom.

DEIOTARUS, a tetrarch of Galatia in Asia Minor, and a faithful ally of the Romans. At the beginning of the third Mithridatic war, he drove out the troops of Mithridates from Phrygia. Pompey, when settling the affairs of Asia (63 or 62 B.C.) rewarded him with the title of king and an increase of territory (Lesser Armenia). Deiotarus naturally sided with Pompey in the civil war and after Pharsalus escaped with him to Asia. In 47 Caesar arrived in Asia from Egypt and pardoned Deiotarus for having sided with Pompey. In consequence of the complaints of certain Galatian princes, Deiotarus was deprived of part of his dominions, but allowed to retain the title of king. On the death of Mithridates of Pergamum, tetrarch of the Trocmi, Deiotarus was a candidate for the vacancy. Other tetrarchs also pressed their claims, Deiotarus was accused by his grandson Castor of having attempted to assassinate Caesar when the latter was his guest in Galatia. Cicero undertook his defence, but the assassination of Caesar prevented any final decision. In his speech Cicero deals mainly with the distribution of the provinces, the real cause of the quarrels between Deiotarus and his relatives. After Caesar's death, Mark Antony, for a large sum of money announced that, in accordance with instructions left by Caesar, Deiotarus was to resume possession of all the territory of which he had been deprived. When civil war again broke out, Deiotarus was persuaded to support Brutus and Cassius, but after Philippi went over to the triumvirs. He remained in possession of his kingdom till his death at a great age (see GALATIA).

See Cicero *Philippica*, II.37, *Ad frat. vul.* 10, 12, 13, 17, 2, 4, *Ad Att.* 10, 1, *De div.* 1, 15, 16, 36, 37, *De harusp.* 109, 111, and above all *Pro rege Deiotaro*, Appian, *Bell. Mitrid.* 75, 114, *Bellum Alexandr.* 104, 34–41, 65–77, Dio Cassius xli 63, xlii 45, xliii 24, 38, xliiii 33.

DEIR or **DEIR EZ-ZOR**, a town in Syria (French mandated territory until 1941) on the right bank of the Euphrates, 215 mi. above its junction with the Khäbūr population 6,659. The chief town of a considerable area it boasts a hotel, bazaar and many shops. It has a French garrison and an acrodrome, macadamized streets and a public garden, and is a centre of commerce. In Ptolemy's list of towns on the right bank of the Euphrates (Geog. v. 18) the following have been identified with Deir ez-Zor: *Gadurtha* (Tischer, Herzfeld), *Birtha* (Kiepert), *Ausara* (= *Ausara*) (Dussaud). The ancient roads from Aleppo and Damascus to Baghdad met here. One of the modern motor routes from Damascus to Baghdad passes through the town.

DEIRA, the southern of the two English kingdoms afterwards united as Northumbria. According to Simeon of Durham it extended from the Humber to the Tyne, but the land was waste north of the Tees. York was the capital of its kings. The date of its first settlement is quite unknown, but the first king of whom we have any record is Ella or Aelle, the father of Edwin, who is said to have been reigning about 585. After his death Deira was subject to Aethelfrith, king of Northumbria, until the accession of Edwin, in 616 or 617, who ruled both kingdoms (see EDWIN) till 633. Osric the nephew of Edwin ruled Deira (633–634), but his son Oswine was put to death by Oswio in 651. For a few years subsequently Deira was governed by Aethelwald, son of Oswald. See Bede, *Historia ecclesiastica*, II.14, III.1, 6, 14 (ed. C. Plummer, 1896). Nennius, *Historia Brittonum*, 3.64 (ed. Th. Mommsen, Berlin, 1898), Simeon of Durham, *Opera*, I, 339 (ed. T. Arnold, 1882–85) (F G M B).

DEIRDRE, in older Irish Derdriu, the heroine of the tale of the *Fate of the Sons of Uisnech*, one of the "three sorrowful tales" of Ireland. According to the story, she was the daughter of Feidlimid, son of Dall, the king's story-teller. When the Ultonian braves were drinking in the house of Feidlimid, and his wife, then pregnant, was serving them, the child screamed from the womb of her mother. The druid Cathub prophesied that a girl-child would be born, by name Derdriu, and great evil would come with her. The Ultonians said she should be slain, but King Conchobar interfered, and ordered her to be brought up in seclusion, and kept to be his own wife. Derdriu grew up thus, but having accidentally come in contact with Níais, son of Uisnech, she fell in love with him, and persuaded him and his two brethren, Amle and Ardan, to carry her off to Alba. Here the four lived together for some time, but they were enticed back by guile by Conchobar's emissaries. The three brethren were slain, and Derdriu taken to Conchobar, but she committed suicide to avoid falling into the king's hands. The *dénouement* of the tale varies, however, in different versions.

The tale is edited (without translation) in Windisch's *Irische Texte*, vol. I (Leipzig, 1880). A convenient edition of a modern version has been published, with translation and vocabulary, by the Society for Preservation of the Irish Language (1898). For a modern Scottish Gaelic version see Alex. Carmichael, *Deirdre* (Paisley, 1914).

(R A S M.)

DEISM is a theological term bearing two accepted meanings.

1. It is the technical name for a particular philosophical doctrine concerning the relation of God to the world. Deism is then contrasted with theism (*q.v.*), though etymologically the two words are equivalent. Whereas theism asserts God to be continuously active in the world and in touch with human souls, *i.e.*, to be immanent in, or operative upon, nature and man in respect of providential guidance, revelation and grace, deism limits the divine activity to creation of the world and fixation of its primary collocations. It conceives the world-process to be determined by these alone. The world originally received from its Maker a capacity for self-development, or a delegated autonomy describable in terms of proximate causes without invocation of further divine intervention. Thus deism is what is popularly called the doctrine of an absentee God, who, once and for all having wound up the world-machine, has left it to run its course and to work out its self-evolution. In this extreme form, deism has seldom been embraced by theological thinkers, it has rather seemed to be in exaggerated conception of the relative independence of the world and its causal nexus. But unless theism asserts somewhat or relatively fixed order and continuity of causal determination in created things, from which the Deity stands "a hand breadth off" to give free play, so that God is not the sole operative cause in the spheres of physical process and human conduct, it lapses from the doctrine of an immanent God into pantheism. In other words, if theism is to be in earnest with the distinction involved in speaking of God *and* the world, and is not to adopt Spinoza's identification, expressed in his phrase *God or Nature*, it must accept so much of deistic tincture as to enable it to assert that there is a world-order which, however dependent on God, is in some degree independent of Him in that, when once "planted out," it evolves according to the laws of its being, and so provides a sphere for His continuous energizing. Thus pantheism

and deism are two extremes between which theism is a middle way

2 Deism is also the received name for a trend of theological thought, not explicitly concerned with the philosophical problem above indicated. The term then has an historical, rather than a technically philosophical, signification, and this is its earlier and commoner meaning. The movement which the word indicates was connected primarily with the relation of revealed religion to natural religion, or the relation of Christian doctrine to theology mediated by reason alone, as exercised on the world and man. It manifested itself chiefly, but not exclusively, in England, and most conspicuously in the 18th century. In fact "deism" is very commonly an abridgment of the phrase "English deism of the 18th century." Deistic thought had, indeed, already appeared in the 17th century, but it was then premature and consequently still-born, whereas the movement in the first half of the succeeding century evoked widespread excitement and controversy, and profoundly influenced theological science.

Deism, as it first emerged, was the natural issue, in theology, of historical causes that operated similarly in other fields of thought. The Reformation had brought individual liberty in religion, and toleration had become a politically expedient practice. Consequently, variety of opinion found expression, from allegiance to the orthodox theology such as might be called protestant scholasticism, to the vagaries and "enthusiasms" of individuals and sects. The new physical science, progressing rapidly after the Copernican revolution, was presenting an exemplar of certain knowledge, a sound method and criterion of truth. This was the primary quest of deism. It was first prosecuted by Lord Herbert of Cherbury (1583-1633), the father of English deism, and a contemporary of Descartes. Without denying or repudiating historically "revealed" religion, such as Christianity, Lord Herbert commended a "natural" religion, not transmitted by tradition admitting of corruption, nor accepted on external authority, but demanded and established by reason common to all men, and capable of finding universal acceptance. Adopting as certain, because unquestioned in his age, the belief that in all men there is divinely implanted a faculty, such as was commonly called "natural light," comparable to instinct save that it is of the nature of intellect rather than of sensibility, he taught that this rational light is the mediator of innate ideas or "common notions" in which the essential elements of all true religion are to be found. These are that God exists, that man's duty is to worship Him, that virtue and piety are the essentials of worship, that repentance and retribution are divinely called for from us, and that there is a future life in which reward and punishment will be meted out. Such, he further held, was the primitive form of religion, from which mankind has been diverted.

As Herbert laid the foundations of deism, in the 17th century, in so far as its positive and its philosophical aspects are concerned, so also, during the same century, did Charles Blount (1654-93) initiate the negative procedure which became the more conspicuous characteristic of deism in the later stages of its development. This procedure consisted in criticism of the Scriptures, of received views as to authorship of the sacred books, of miracles, of specific Christian doctrines, and of ecclesiastical history. It has been called negative, because its aim was not so much to commend the certainty and sufficiency of natural theology, of which deism at first asserted revealed theology to be a more or less superfluous republication, as to suggest the doubtfulness of the data, evidences and arguments, on which revealed religion had hitherto been based. The chief writers who, between 1700 and 1750, conducted this attack upon orthodoxy, were Thomas Woolston, Anthony Collins, Thomas Morgan and Thomas Chubb. They were not scholars of the highest order, nor thinkers of more than mediocre ability. Indeed they were silenced by writers better equipped with learning. Nevertheless deism of this negative or sceptical kind was not merely the exhibition of temporary unrest or discontent. It was an expression of vague suspicions which developed into critical sciences that, in the succeeding century, effected a revolution in Christian apologetics. In its championship of freedom of inquiry, in search for certainty instead of groundless or disputable opinion, in its insistence on reason as

the sole instrument for acquiring and judging of truth, and in its use of the method of doubt, deism may be said to offer a parallel to the Cartesian renaissance in philosophy, and to represent the beginning of modernity in English theology. Hence, even on its negative side, deism is an important movement in the history of theological thought.

This phase of 18th century deism finds its best expression in two works. The first is *Christianity not mysterious*, by John Toland, in which it is argued that there is nothing in the Gospels that is mysterious, either in the sense of being contrary to reason or in the sense of being above or beyond reason. Toland, from one point of view, upheld the certainty of the natural theology which reason could read, and of the revelation that had been divinely vouchsafed to it. Provided they are allowed to put their own interpretation on the vague and ambiguous word "reason," most persons of common sense, as well as most philosophers, will perhaps nowadays accept Toland's conclusion. If reason include the discovery of actual premises, such as science deals with, it does not provide the infallible natural theology that deism prided itself on having found, and in comparison with which it afterwards proceeded to disparage revealed religion. Rather did Bishop Butler, the most considerable critic of the deists, bid the mark in his pregnant dictum, "probability is the guide of life." The other of the two works just now referred to, is Matthew Tindal's *Christianity as old as the Creation, or the Gospel a Republication of the Religion of Nature*. This book states the case in favour of natural religion more comprehensively than any other of its period. It came to be called "the deist's Bible," and it evoked in especial degree the notice of Bishop Butler and other defenders of revealed religion. The deistic creed, here set forth, is essentially similar to that of Lord Herbert, and natural religion is regarded as consisting in rational knowledge, as contrasted with subjectively caused belief, together with morality. Revelation is restricted to communication of ready-made truth, and the "natural" revelation, old as creation, is described as "internal," *se*, as involved or implicated in the constitution of the world and the natures of God and man. Being thus essential or intrinsic, it is an eternal truth of reason, not contingent on historical facts.

If any one of the deists' tenets was more fundamental than another, it was their assertion that revealed religion presupposes natural religion. And this, though it was for the most part overlooked or evaded during the 19th century, may be regarded as their lasting contribution to theological thought. Unfortunately their conception of the content of natural theology, and of the rational grounds on which they supposed it to be infallibly based, involved *a priori* assumptions which, shortly after deism found its completed expression in Tindal, were demolished by Hume, and later by Kant. Genetic sciences as yet scarcely existed, evolution or development was as wanting from the stock of 18th century ideas as it was paramount in the succeeding century. So the deists worked with static ideas, and some of the assumptions, which to them seemed self-evident truths, came to be found inconsistent with facts. Human nature and reason are evolved products, and reason as innate *homo natura*, to which, the deist thought, a just God *must* reveal Himself perfectly and clearly from the first, never existed. It may be observed, however, that none of those free thinkers held the kind of deism that was here first described, but rather repudiated it as "atheism."

See Leslie Stephen, *History of English Thought in the 18th century*, Vol. I (1876 and 1902) and the bibliography therein. (F R T)

DEISTER, a chain of hills in Germany, in the Prussian province of Hanover, about 15 m SW of the city of Hanover. It runs from Springe in the south of Rodenberg in the north. It has a total length of 14 m and rises in the Hölfer to a height of 1,250 feet. The chain is well-wooded and abounds in game. There are some coal mines and sandstone quarries.

DÉJAZET, PAULINE VIRGINIE (1798-1875), French actress, born in Paris on Aug. 30, 1798, first appeared on the stage at the age of five. In 1820 she started to play soubrette and "breeches" parts at the Gymnase, with such success that such parts became known as "Déjazets." After playing at the Nouveautés and the Variétés she became manager of the Folies,

renamed the Theatre Dejazet. Here, even at the age of 65, she had marvellous success in youthful parts, especially in some previously unacted early plays of Sardou. She retired in 1868, and died on Dec. 1, 1875.

Duval, *Virginie Déjazet* (1876), L. H. Lecomte, *Un amour de Déjazet* (1907), and *Virginie Déjazet* (1904)

DE KALB, a city of De Kalb county, Ill., U.S., on the Kishwaukee river, 60 mi W of Chicago. It is on federal highway 30A, is served by the Chicago and North Western, Chicago Great Western and Chicago, Milwaukee, St. Paul and Pacific railways. Land area 2 sq mi. The population was 11,708 in 1950 and 9,146 in 1940 by the federal census.

Barbed wire was invented and first manufactured there. Other products manufactured are truck bodies, insulated copper wire and cable, pianos, piano accordions, canned vegetables, commercial refrigerating machinery, screen cloth, day beds, bed springs, ladies' apparel, books, fractional-horsepower motors, drop forgings and gray iron castings.

De Kalb is in the centre of the rich agricultural lands, corn, small grain and cattle raising predominate. The Northern Illinois State Teachers college occupies a campus of 67 ac. De Kalb was settled in 1832, incorporated a city in 1877, until 1840 it was called Buena Vista.

DE KEYSER, THOMAS (1596 or 1597-1667). Dutch painter, was born at Amsterdam, the son of the architect and sculptor Hendrik de Keyser. Aert Pietersz, Cornelis vander Voort, Werner van Valkert and Nicolaas Elzas are accredited by different authorities with having developed his talent. De Keyser chiefly excelled as a portrait painter, though he also executed some historical and mythological pictures, such as the "Theseus" and "Aradne" in the Amsterdam town hall. His portraiture is full of character and mastery in handling, and often, as in the "Old Woman" of the Budapest gallery, is distinguished by a rich golden glow of colour and Rembrandtesque chiaroscuro. Some of his portraits are life-size, but the artist generally preferred to keep them on a considerably smaller scale, like the famous "Group of Amsterdam Burgomasters" assembled to receive Marie de' Medici in 1638, now at The Hague museum. His pictures are in the Dresden and Frankfurt museums, in the Heyll collection at Worms, and the Liechtenstein gallery in Vienna. The National Gallery, London, owns a characteristic portrait group of a "Merchant with his Clerk". The Hague museum, besides the group already referred to, a magnificent "Portrait of a Savant," and the Haarlem museum a fine portrait of "Claes Fabricius." At the Ryks museum in Amsterdam there are 12 of his works.

DEKKER, EDWARD DOUWES (1820-1887), Dutch writer, commonly known as **MULTATULI**, was born at Amsterdam on March 18, 1820. In 1838 he went out to Java, and obtained a post in the inland Revenue. He rose from one position to another until, in 1857, he found himself assistant-resident at Ambon, in the Moluccas. In 1857 he was transferred to Laban, in the Bantam residency of Java. By this time, however, he had begun to protest against the abuses of the colonial system. He was threatened with dismissal from his office for his opennes of speech, and, throwing up his appointment, he returned to Holland in a state of fierce indignation. He determined to expose in detail the scandals he had witnessed, and he began to do so in newspaper articles and pamphlets. In 1860 he published under the pseudonym of "Multatuli," his romance, *Max Havelaar* (Eng. trans. by W. Stebbins, with introd. by D. H. Lawrence, 1927). This book made a complete exposure of the abuse of force labour in the Dutch Indies. His *Memnebreven* (1861), in spite of their mild title of "love letters" proved to be mordant satires of the most rancorous and unsparring kind. He collected his miscellanies in *Wierook* (1862), called *Ideen* (7 vols., 1862-77), and shaking the dust of Holland from his feet, went to live at Wiesbaden. Dekker died at Wiesbaden, on the Rhine, on Feb. 19, 1887. His *Brieven* (16 vols., 1890-92), and his *Verzamelde Werken* (10 vols., 1902) were edited by his widow.

See t. van Eeden, "Multatuli" in *Studien* (vol. 1 18,0), and G. Jonckbloet, *Multatuli* (1894)

DEKKER (DE DICKER), **THOMAS** (c 1572-c 1632), English dramatist, was born in London, and a Thomas Dekker who may probably be identified with the poet, was buried at St James's, Clerkenwell, on Aug. 25, 1632. Ben Jonson drew him as Demetrius Fannius, the "dresser of plays," in the *Postaster*. His name as playwright first appears in Henslowe's *Diary* on Jan. 8, 1598, and he was busily engaged in the preparation of plays in the next few years. In all he is said to have had a hand in 44 plays. His special interest is as a depicter of London life, of the manners and tastes of the citizens and their wives, of the London apprentice, and of the young aristocrats who frequented the play-house. About six of the plays attributed to Dekker survive. *Old Fortunatus*, drawn from a German tale already dramatized by Hans Sachs, was played on Dec. 27, 1599, and printed in 1600. *The Shoemaker's Holiday*, based on T. Deloney's prose tract *The Gentle Craft*, was probably played in 1600, and was printed in that year. *Patent Grissill* (played 1600, pr. 1603) was the joint work of Dekker, Chettle and Haughton. In *Satirastomach* (played 1601, pr. 1602), which was a counterblast to Jonson's *Poetaster*, Dekker seems to have had the help of Marston. Dekker also had a hand in *Sir Thomas Wyatt* (1602), *The Honest Whore* (1604), *Westward Ho* (1604) and many others. If *It be not Good the Devil is in It* (c. 1610) and *Match Me in London* (of unknown date) are ascribed wholly to Dekker, and many plays for which his name is given in the theatrical records are lost. The last play in which he had a share appears to be *The Noble Soldier* (c. 1631), in which Day and S. Rowley were perhaps his associates.

Dekker was also a popular pamphleteer, and one of his pamphlets, *The Gull's Hornbook* (1609) gives an unmatched picture of the London of Dekker's day by describing in detail a day in a young fop's life in the city. In *The Wonderful Year* (1603) he describes the state of London during the plague of that year with a realism that matches Defoe. Other pamphlets are *The Seven Deadly Sins of London* (1606), *News from Hell, Brought by the Devils Carrier* (1606), etc.

In 1613 Dekker's fortune, never too radiant, underwent eclipse. In 1598 and 1599 Henslowe had lent him money for his discharge when he had been arrested, but in 1613 he was put in the King's Bench prison for debt, and lay there certainly until 1616 and perhaps until 1619. In *Dekker his Dreame* (1620) he speaks of the "Bed in which seven years I lay dreaming," possibly referring to his prison bed.

Dekker is not one of the greatest dramatists of his time, but his loveable personality, his irrepressible humour and his Londoner's lightheartedness, whimsicality and happy-go lucky temperament have endeared him to all students of Jacobean London. He was, too, a lyric poet of genius, and to him we owe some most charming lyrics. One of them "Art thou poor, yet hast thou golden slumbers" is to be found in every anthology of the period.

Dekker's *Dramatic Works* were edited by R H Shepherd (1873), and four plays were published by E Rhys in the *Mermaid Series* (1887). His *Non-Dramatic Works* were edited by A B Grosart (1884-86) for the Huth Library, and *The Gull's Hornbook* by R B McKerrow (1904). See E K Chambers, *The Elizabethan Stage* (vol. vi, 1923).

DE KOVEN, REGINALD (1861-1920), composer, was born at Middletown, Conn., April 3, 1861. At the age of 20 he graduated from Oxford with a doctor's degree in music. He also studied music in Stuttgart, Florence, Paris and Vienna. After his return to the United States, he wrote music criticism for many publications, including *Harper's Weekly* and the *New York World*. In 1902 he founded the Washington Symphony Orchestra, which he conducted until 1905. He was a fertile composer of comic operas, 300 songs and works for piano and orchestra. The first included *Don Quixote: The Hero—The Fools, Madmen, Robbers, The King's Courtiers, The Merry Men, The Beggar to the Prince, The Garden Boy, The Rascal of the Red Sea*, successful of all his given to the American stage and production through out the English speaking world. Two grand operas *Trilby* and *The Centaur's Progress* were also composed by him. He died in Chicago, Jan. 15, 1922.

DE LA BECHF, SIR HENRY THOMAS (1896-1955), English geologist was born in 1896 the son of an army officer.

settled in Jamaica. The boy spent his youth in England with his mother at Lyme Regis and was educated for the army at the college at Great Marlow, but the peace of 1815 changed his career. He joined the Geological Society of London, of which he was president in 1848-49. After a period of travel in Europe he began the detailed investigation of the rocks of Cornwall and Devon. Thrown much into contact with the mining community, he conceived the idea that the nation ought to compile a geological map of the United Kingdom, to aid the scientific development of its mineral industries, and persuaded the government to give him an appointment in connection with the Ordnance Survey. This formed the starting point of the Geological Survey of Great Britain, which was officially recognized in 1835, when De la Beche was appointed director. Eventually Parliament sanctioned the erection of a museum of geology and the organization of a staff of professors. The establishment, in which were combined the offices of the Geological Survey, the Museum of Practical Geology, The Royal School of Mines and the Mining Record Office was opened in Jermyn street, London, in 1851.

De la Beche published numerous memoirs on English geology in the *Transactions of the Geological Society of London*, as well as in the *Memoirs of the Geological Survey*, notably the *Report on the Geology of Cornwall, Devon and West Somerset* (1839). In his *Researches in Theoretical Geology* (1834) he enunciated a philosophical treatment of geological questions much in advance of his time. His *Geological Observer* (1851, 2nd ed., 1853), enlarged from an earlier work, displays his talent for artistic delineation of geological phenomena. He was elected FRS in 1819, was knighted in 1848, and near the close of his life was awarded the Wollaston medal. He died on April 13, 1855.

See Sir A. Geikie's *Memoir of Sir A. C. Ramsay* (1895), which contains a sketch of the history of the Geological Survey, and of the life of De la Beche (with portraits), also *Summary of Progress of the Geological Survey for 1897* (1898).

DELABORDE, HENRI FRANÇOIS, COUNT (1764-1833), French soldier, the son of a Dijon baker, served in the revolutionary war from the beginning. He was created count in 1808 when he was serving under Junot in Portugal. He fought the skilful action of Rolica. In 1812 he was a divisional commander under Mortier in the Russian campaign. He joined Napoleon during the Hundred Days, was court-martialled at the Restoration, but acquitted on technical grounds.

DELAEROIX, FERDINAND VICTOR EUGENE (1798-1863), French historical painter, leader of the romantic movement, was born at Charenton-St. Maurice, near Paris, on April 26, 1798. His father, Charles Delacroix (1741-1805), was foreign minister under the Directory. Eugene was educated at the Lycée Napoléon, and then entered the atelier of Baron Guérin. He studied the works of Rubens and Paolo Veronese at the Louvre, and he was attracted by the work of Jérucaut, whose influence can be traced in Delacroix's first important picture, "Dante and Virgil," exhibited in 1822 and now in the Louvre. At a time when the classic school was predominant and artists were intent on the representation of scenes of antiquity and mythology the appearance of Delacroix's "Massacre of Chios" in the Salon of 1824 marked a victory for the romantic movement. It represented in a tragic manner the atrocities enacted in Greece, and, like Byron's poetry, enlisted sympathy for the Greek War of Independence. The picture was painted in glowing colours, and contrasted with the dark canvases of the Classicists, whose opposition was roused. The aged Gros is said to have called the "Massacre of Chios" *le massacre de la peinture*. Delacroix spent some months in England in 1825, and drew fresh inspiration from the works of Byron. He was attracted by the fresh and direct painting of Constable's landscapes. His next two pictures, "Marino Faliero Decapitated on the Giant's Staircase of the Ducal Palace" and "Greece Lamenting on the Ruins of Missolonghi," with many smaller works, were exhibited for the benefit of Greek patriots in 1826. Next year he produced "Sardanapalus," from Byron's drama. After this, he says, "I became the abomination of painting, I was refused water and salt"—but, he adds with singularly happy naïveté, *J'étais enchanté de moi-même!* The

patrimony he inherited, or what remained of it, was 10,000 *livres de rente*, and with economy he lived on this, and continued to paint large historical pictures. In 1831 he reappeared in the Salon with six works, among which was "Liberty leading the People," now in the Louvre, and immediately after left for Morocco, where he found the colour and light which flooded his later work "The Entry of the Crusaders" into Constantinople is a powerful colour harmony (Louvre). A visit to Madrid acquainted him with the methods of Velasquez and Goya. The "Noce Juive" (1839) in the Louvre shows the influence of Spain. In 1835, through the influence of Thiers, he received a commission to decorate the interior of the chamber of deputies, and between that date and 1861 he completed that and other great decorative works "The Triumph of Apollo," the panel in the centre of the ceiling of the Galerie d'Apollon in the Louvre, subjects from the Divine Comedy in the library of the Luxembourg, and the mural paintings in the church of St. Sulpice, and in the Salon de la Paix in the Hôtel de Ville. Delacroix died on Aug. 13, 1863, at Champrosay, considered the greatest of the romanticist subject painters. Although he was hailed during his life time as a great revolutionary, it is not him, but Ingres, his classicist opponent and rival, whom modern painters claim as their ancestor. His large pictures represent romantic epics have not created a following. It is by his magic colour harmonies that he contributed to the development of painting, and his subtle decomposition of colour taught one of their principal secrets to the impressionists.

Moreau, *Delacroix et son œuvre* (1893), Dorothy Bussy, *Eugène Delacroix* (1907), Ph. Burty, *Lettres d'Eugène Delacroix 1815-1863* (1879), Raymond Escholer, *Delacroix* (1927).

DE LA GARDIE, JAKOB, COUNT (1583-1652), Swedish field-marshal, son of Count Pontus de la Gardie, was born at Reval on June 30, 1583. In 1610 he led an army of mercenaries to Moscow in support of Basil Shusky, after his abdication La Gardie seized Ingria and Novgorod, which acknowledged the sovereignty of the Swedes, but the Swedish army was held up before Pskov. But with the accession of the Romanovs the Russian situation changed. La Gardie defeated the Russians at Bronitski in July 1614, but Gustavus Adolphus now took charge of the operations, and with him La Gardie returned to Sweden. By the peace of Stolbova (1617) the Swedish possessions on the eastern Baltic were secured. La Gardie was promoted field-marshal, and devoted himself to the organization of the army. In 1625 he was again fighting in the Baltic provinces. On the death of Gustavus Adolphus he was appointed one of the guardians of the child queen Christina. He married in 1618 Countess Ebba Brahe, the early love of Gustavus Adolphus. He died on Aug. 22, 1652.

See A. Hamilton, *Minne af riksmarsken greve Jakob Pontusson de la Gardie* (1880).

DE LA GARDIE, MAGNUS GABRIEL, COUNT (1622-1686), Swedish statesman, was born on Oct. 15, 1622, in Reval, son of the preceding. In 1646 Queen Christina sent him on an extraordinary mission to France, and on his return he married the queen's cousin, Marie Euphrosyne of Zweibrücken. He stood well in Christina's favour and continuously held high office until 1653 when he fell into disgrace and had to leave the court. But in the reign of Charles X (1654-60), his brother-in-law, he held high command in the army fighting in the Baltic provinces against Russia and Poland, and conducted the peace negotiations at Oliva (1660). Charles appointed him grand chancellor and a member of the Council of Regency of Charles XI during his minority. He succeeded in dominating the council, and pursued a policy of reckless extravagance, and in 1674 engineered the alliance with France, which entangled Sweden two years later in the disastrous war with the elector of Brandenburg (See *SWEDEN History*). In 1675 a special commission was appointed to enquire into the conduct of De la Gardie and his associates, and on May 27, 1682, it decided that the regents and the senate were solely responsible for dilapidations of the realm, the compensation due by them to the Crown being assessed at 4,000,000 *daler* or £500,000. De la Gardie was treated with relative leniency, but he "received permission to re-

ture to his estates for the rest of his life" and died there in comparative poverty, a mere shadow of his former magnificent self. He was a man of brilliant social gifts and a great patron of literature and art. He presented to the library at Uppsala the famous late 15th century *Codex Argenteus* of Uhlans' Gothic version of the Gospels.

See Martin Vebull, *Svegers Störhetstid* (Stockholm, 1881), *Sv. Hist. IV*, R. N. Bun, *Scandinavia* (Cambridge, 1905), *Konst och Konstnärer* and *M. G. de la Gardie's Hof* (1905).

DELAGE, YVES (1854–1920), French zoologist, was born on May 13, 1854, at Avignon. He became zoology professor at the Sorbonne in 1886. In 1901 he was made director of the laboratory of marine biology at Roscoff, Finistère. Delage was one of the first authorities on animal reproduction hybridism and heredity (see **HYBRIDISM**).

He died in Paris on Oct. 8, 1920.

See *L'Hérédité et les grands problèmes de la biologie générale* (1895, 2nd ed., 1903), *La Structure du protoplasma* (1895), *Traité de zoologie comparée* (6 vols., 1896–1902), *Les Théories de l'évolution* (1900, Eng. trans. 1912), *Le Parthénogénèse naturelle et expérimentale* (1913), with M. Goldsmith, *Le Reptile, étude psychologique, philosophique et littéraire* (1919).

DELAGOA BAY (Portuguese for the bay "of the lagoon"), officially known as *Bahia de Lourenço Marques* (qv), an inlet of the Indian ocean on the east coast of South Africa, between 25° 40' and 26° 20' S, with a length of 26 m and a breadth of 22 m. It is the northern termination of the series of lagoons which line the coast from St. Lucia bay. The opening is towards the north-east. The southern part of the bay is formed by the Inyaka (native *Nyaka*) or Mablungulu peninsula.

North of the peninsula is Inyaka island, with the fishing village of Pt. Melville at its north-west point, and beyond Elephant's island Delagoa Bay forms a valuable harbour, accessible to large vessels at all seasons of the year. The surrounding country is low and very unhealthy, but the island of Inyaka has a height of 240 ft., and could be used as a sanatorium. The Manihisa or Komati river enters the sea just north of the bay, the Matolia, the Umbeluzi and the Tembe, from the Lebombo, meet in the estuary called by the Portuguese the Espírito Santo, but generally known as the English river, and the Maputa, or Lusitua, which has its head waters in the Drakenberg, enters in the south, as also does the Funtl river. These rivers are the haunts of the hippopotamus and the crocodile.

The bay was discovered by the Portuguese navigator Antonio de Campo, one of Vasco da Gama's companions, in 1502. Antonio Caldeira explored the lower courses of the rivers entering Delagoa Bay especially the Espírito Santo. The Portuguese visited the district from time to time. In 1721 the Dutch East India company built a fort and "factory" on the spot where Lourenço Marques now stands, but in 1730 the settlement was abandoned. Thereafter the Portuguese had—intermittently—trading stations on the Espírito Santo. In 1771, the Austrian Asiatic company of Trieste attempted to establish a station there, but were expelled. Intermittent native wars followed the building of a fortress on the site of the present town in 1781. In 1823 W. F. W. Owen concluded treaties of cession with native chiefs and appropriated to Britain the country from the English river southwards. In 1824 the Portuguese disregarding the British treaties concluded treaties with the natives, and endeavoured (unsuccessfully) to take military possession of the country. The sovereignty of either power was left undecided till the claims of the Transvaal Republic rendered a solution of the question urgent. Great Britain had taken no steps to exercise authority on the spot, while the ravages of Zulu hordes, combined Portuguese authority to the limits of their fort. In 1835 Boers had attempted to form a settlement on the bay, which is the natural outlet for the Transvaal, and in 1868 the Transvaal President Marthinus Pretorius, claimed the country on each side of the Maruta down to the sea. In the following year, however, the Transvaal acknowledged Portugal's sovereignty over the bay. In 1861 Bickford had declared Inyaka and Elephant's island British territory. In 1872 the dispute between Great Britain and Portugal was submitted to the arbitration of M. Thiers, the French President, and on July 24, 1875,

his successor, Marshal MacMahon, declared in favour of the Portuguese. It had been previously agreed by Great Britain and Portugal that the right of pre-emption in case of sale or cession should be given to the unsuccessful claimant to the bay. Portuguese authority over the interior was not established until some time after the MacMahon award, normally the country south of the Manihisa river was ceded to them by the Matshangana chief Umzila in 1861. In 1889 another dispute arose between Portugal and Great Britain in consequence of the seizure by the Portuguese of the railway running from the bay to the Transvaal. This dispute was referred to arbitration, and in 1900 Portugal was condemned to pay nearly £1,000,000 in compensation to the share holders in the railway company (See LOURENÇO MARQUÊS and GAZALAND).

For an account of the Delagoa Bay arbitration proceedings see Sir E. Hertslet, *The Map Of Africa by Treaty* (1909). Consult also the British blue-book, *Delagoa Bay, Correspondence respecting the claims of Her Majesty's Government* (1875), L. van Deventer, *La Hollande et la Baie Delagoa* (The Hague, 1883), G. McC. Theal, *The Portuguese in South Africa* (1896), Tessé, *The Key to South Africa, Delagoa Bay* (1899), and *History of South Africa since September 1795* (1908). *The Narrative of Voyages to explore the shores of Africa performed under direction of Captain W. F. W. Owen, R.N.* (1833) contains much interesting information concerning the district in the early part of the 19th century.

DELAINE A term which applies strictly to an all-woollen fabric of light and fine texture and constructed with the plain calico weave. The fabric may be all white or piece-dyed, i.e., dyeing the cloth in the "piece," after weaving, as distinct from coloured cloth woven from warp and weft yarn dyed previous to weaving. Delaine fabrics are also sometimes figured with patterns in various colours. The pattern may be printed on the warp, before weaving, after the manner adopted in chintzes and cretonnes (qv) and in Chiné silk fabrics, while others are printed with patterns after weaving, as in calico printing. One quality of delaine is made with 54 warp ends per inch, of 46's, and 64 picks per inch of 64's Botany wool. Delaine union fabrics are also produced from a cotton warp and Botany weft, with 30's counts of yarn for both warp and weft, and with 64 warp threads and picks per inch. Some fabrics described as "delainettes" are produced from all-cotton both for warp and weft of soft spun yarn, and finished with a soft finish similar to that of the lighter and finer textures of flannel (qv).

(H. N.)

DE LA MARE, WALTER JOHN (1873–), British poet and novelist, of Huguenot descent, was born on April 25, 1873, at Charlton, Kent, and educated in London at St. Paul's Cathedral Choir school. From 1889 to 1908 he was engaged in business in London, but he had already printed poems and prose, writing as "Walter Ramal" in *The Cornhill* and other magazines, and in 1902 his *Songs of Childhood* appeared, his novel *Henry Brocken* following in 1904. A grant from the Privy Purse enabled him to devote himself fully to literary work, and he gradually found a growing audience for his delicate and highly individual work. *The Return* (1910) won the Prix de la Poésie. *The Listeners and other Poems* (1912), *Peacock Pie* (1913), *Motley and Other Poems* (1918) brought him to the front rank of his contemporaries, and volumes of his collected poems appeared in 1920, 1935 and 1942, as well as *Collected Rhymes and Verses* in 1944. A lyrical play *Crossings*, was published in 1921, and also further poems, *The Fall*. The long novel, *Memoirs of a Midwife* (1921), showed his prose gifts at their highest. It also showed him to be a master of fantasy (he gives substance and verisimilitude to the fantastic) and of symbolism, and the critic has seen in him the heir of Macmillan tradition. Other prose volumes included *The Riddle* (1921), *Broomsticks* (1925), *The Commoisier and Other Stories* (1926), *Lewis Carroll* (1932) and *Mr. Bumps and His Monkey* (1942).

See R. I. Mignoz, *Walter de la Mare* (1924).

DELABRE, JEAN BAPTISTE JOSEPH (1749–1822), French astronomer, was born at Amiens on Sept. 19, 1749. In 1771 he became tutor to the son of M. d'Assy, receiver-general of finances. He attended the lectures of J. J. Lalande, who induced d'Assy in 1788 to install an observatory for his benefit at his own

residence. Here Delambre observed and computed almost uninter-
ruptedly, and in 1790 obtained for his *Tables of Uranus* the prize
offered by the academy of sciences. He was admitted to the In-
stitute on its organization in 1795, and became, in 1803, perpetual
secretary to its mathematical section. He served from 1795 on
the bureau of longitudes. From 1792 to 1799 he was occupied
with the measurement of the arc of the meridian extending from
Dunkirk to Barcelona, and published a detailed account of the
operations in *Base du système métrique* (3 vols., 1806, 1807,
1810). He succeeded Lalande in 1807 as professor of astronomy
at the Collège de France, and was treasurer to the imperial uni-
versity from 1808 until its suppression in 1815. Delambre died
in Paris on Aug. 19, 1822. He wrote *Histoire de l'astronomie
ancienne* (2 vols., 1817), *Histoire de l'astronomie au moyen âge*
(1819), *Histoire de l'astronomie moderne* (2 vols., 1821), *His-
toire de l'astronomie au XVIII^e siècle* (édit. C. L. Mathieu, 1827),
Tables éphémériques des satellites de Jupiter, inserted in the third
edition of J. J. Lalande's *Astronomie* (1792), and republished in
an improved form by the bureau of longitudes in 1817, and other
works.

DELAMERE or DE LA MER, GEORGE BOOTH,
1ST BARON (1622-1684), son of William Booth, of Dunham
Massey in Cheshire, was born in Aug. 1622. He was returned for
Cheshire to the Long Parliament in 1645 and to Cromwell's parlia-
ments of 1654 and 1656. In 1656 he was appointed military com-
missioner for Cheshire and treasurer at war. He was one of the
excluded members who tried and failed to regain their seats after
the fall of Richard Cromwell in 1659. He had for some time been
regarded by the Royalists as a well wisher to their cause, and
now became one of the chief leaders of the new "Royalists" who
at this time united with the cavaliers to effect the Restoration.
A rising was arranged for Aug. 5 in several districts, and Booth
took charge of operations in Cheshire, Lancashire and North
Wales. He seized Chester on the 19th and marched towards York.
The plot, however, had failed in other parts of the country, and
Lambert defeated Booth's men at Nantwich Bridge. Booth him-
self was captured at Newport Pagnell on the 23rd and was im-
prisoned in the Tower. He was soon liberated, sat in the parlia-
ment of 1659-60, and was one of the 12 members deputed to
carry the message of the Commons to Charles II. at The Hague.
In July 1660 he received a grant of £10,000, and on April 20,
1661, he was created Baron Delamere, with a licence to create
six new knights. The same year he was appointed *castrorum*
of Cheshire. He died on Aug. 8, 1684, and was buried at Bowdon.

His second son, HENRY (1652-1694) who succeeded him in the
barony, was created earl of Warrington in 1690. He was im-
plicated in the Rye House Plot (1683), joined William of Orange
in 1688, and received many honours from the new king.

DELAND, MARGARETTA WADE (CAMPBELL)
(1857-1945), American writer, was born at Allegheny, Pa., Feb.
23, 1857. She studied in private schools and at Cooper Union in
New York, and for a time taught drawing. In 1880 she married
L. F. Deland, of Boston. She attracted attention with her first
novel, *John Ward, Preacher* (1881), which dealt with religious
and social questions after the manner of Mrs. Humphry Ward.
Her books include *The Story of a Child* (1892), *The Awakening
of Helena Richie* (1906), *The Iron Woman* (1911), *The Rising
Tide* (1916), *The Vehement Flame* (1922), *Old Chester Days*
(1935). She was most popularly known for her sympathetic
studies of village life and character, *Old Chester Tales* (1899)
and *Dr. Lavendar's People* (1904). She died Jan. 13, 1945.

**DE LAND, a city of Florida, U.S.A., 100 mi SSE of Jack-
sonville, on the St. John river, 18 mi from the Atlantic ocean,
the county seat of Volusia county. It is served by the Atlantic
Coast Line railroad, and by water to Jacksonville. The popula-
tion was 8,536 in 1950 and 7,041 in 1940 by the federal census.
It is in a region of beautiful hills, orange groves and lakes, where
winter truck farming and the growing of citrus fruits and *Aspara-
gus plumosus* fern are important. Ponce de Leon springs are 7
mi north. De Land is the seat of the John B. Stetson university,
established as an academy in 1883 by the founder of the town,
and renamed in 1889 after John Batterson Stetson, a Philadelphia**

hat manufacturer, who gave it nearly \$500,000. The town was
founded in 1876, by Henry A. De Land, a manufacturer of Fair-
port, N.Y., who built a public school in 1877, a high school in
1883 and the academy mentioned above in 1883.

DELANE, JOHN THADDEUS (1817-1879), editor of
The Times, born in London and educated at King's college, Lon-
don, and Magdalen college, Oxford. He was called to the bar at
the Middle Temple in 1847. Delane was editor of *The Times* for
36 years (1847-77), and under his rule the paper acquired very
great influence at home and abroad. It had become a power in
British politics under Delane's predecessor, Barnes, and under
Delane it attained a larger cosmopolitan standing. He superin-
tended in detail the work of the leader writers and foreign cor-
respondents of the paper. Among the latter in Delane's day were
Thomas Chenerly in Constantinople, and Blowitz in Paris. An
example of the caution exercised by Delane in foreign affairs may
be cited. When in 1875 Blowitz sent word that Bismarck contem-
plated a fresh attack on France, Delane held back the news for a
fortnight until he had been able to send Chenerly to Paris to sub-
stantiate the report. Delane had an impartial mind, and built up
a tradition of independence of the Government of the day, even
when it was a Conservative one.

See the biographies by Arthur Irwin Dasent (1908) and Sir Edward
Cook (1915).

DELANO, JANE ARMINDA (1862-1919), American
nurse, was born at Townsend, N.Y., on March 12, 1862. She
graduated from the Bellevue hospital school of nursing in 1886.
In 1888 she was asked to take charge of a temporary hospital
during the yellow fever epidemic in Jacksonville, Florida. After
an experience as visiting nurse in Arizona, in the days of the still
war like Apache Indians, she was appointed superintendent of
nurses at the University of Pennsylvania hospital, Philadelphia,
Pa., 1891, and director of nursing at her alma mater in 1902.
From 1909-12, she served as superintendent of the U.S. Army
Nurse Corps. During the latter part of this period she accepted
the chairmanship of the National Committee on Red Cross Nurs-
ing Service and began the development of a nursing reserve. In
1909 there were but 950 nurses on the Red Cross records. A
month after the outbreak of World War I, ten picked units from
the 5,000, then on the rolls, sailed for Europe. Before the end
of the war 20,000 Red Cross nurses served at home and abroad
with the army, navy and the American Red Cross in its work
among the civilian population. When in France on a tour of in-
spection she died at Savenay, on April 15, 1919, worn out by war
work. After a military funeral overseas her body was brought
home on a U.S. transport for interment at Arlington National
cemetery, on Sept. 18, 1920. Her decorations included Japanese,
Austrian and Pan-American medals, and her country's DSM
awarded posthumously for "extraordinary devotion to duty."

DELANY, MARY GRANVILLE (1700-1788), an Eng-
lishwoman of literary tastes, was born at Coulston, Wilts., on
May 14, 1700, and died on April 15, 1788. She was a niece of the
1st Lord Lansdowne. In 1718 she was unhappily married to
Alexander Pendaves, a rich old Cornish landowner, who died
in 1724. During a visit to Ireland she met Dean Swift and his
intimate friend, the Irish divine, Patrick Delany, whose second
wife she became in 1743. After his death in 1768 she passed all
her summers with her bosom friend the dowager duchess of
Portland—Prior's "Peggy"—and when the latter died George III.
and Queen Charlotte, whose affection for their "dearest Mrs.
Delany" seems to have been most genuine, gave her a small
house at Windsor and a pension of £300 a year. At this time
Mrs. Delany was a charming and sweet old lady, with a reputa-
tion for cutting out and making the ingenious "paper mosaics"
now in the British Museum, she had known everyone worth
knowing in her day, had corresponded with Swift and Young,
and left an interesting picture of polite society in her *Autobio-
graphy and Letters*, 1700-88, an abridged version of which was
compiled by G. Paston, 1900. Burke calls her "a real fine lady"—
"the model of an accomplished woman of former times."

See *Mrs. Delany at Court and among the Wits*. Arranged from the
"Autobiography and Correspondence" With an introduction by
R. Brimley Johnson (1925).

DE LA REY, JACOBUS HERCULES (1847-1914), Boer general, was born in the Lichtenburg district in what is now the Orange Free State, and in his youth and early manhood fought in the Kafir wars. In 1893 he entered the Volksraad of the South African Republic, where he supported the policy of Gen. Joubert. At the outbreak of the war with Great Britain in 1899 De La Rey was made a general, and fought in the western campaign against Lord Methuen and Lord Roberts. He won his first great success at Nitra's Nek on July 11, 1900, where he compelled the surrender of a strong British detachment. In the second or guerrilla stage of the war De La Rey was conspicuously successful. He was assistant to Gen. Louis Botha and a member of the government with charge of operations in the western Transvaal. The principal actions in which he was successful (see also *TRANSVAAL History*) were Nooitgedacht, Vlakfontein and the defeat and capture of Lord Methuen at Klerksdorp (March 7, 1902). The British general was severely wounded in the action, and De La Rey released him at once, being unable to afford him proper medical assistance. This humanity and courtesy marked De La Rey's conduct throughout the war. After the conclusion of peace De La Rey, who had shared in the negotiations, visited Europe with other Boer generals to raise funds for resettlement. In Dec. 1903 he went on a mission to India, and induced the Boer prisoners of war detained at Ahmednagar to accept the new order of things and to take the oath of allegiance. In Feb. 1907 Gen. De La Rey was returned unopposed as member for Ventersdorp in the legislative assembly of the first Transvaal parliament under self-government. At the outbreak of the World War he was implicated in Maritz's rebellion, and was shot dead by a police patrol at Johannesburg on Sept. 16, 1914.

DE LA RIVE, AUGUSTE ARTHUR (1801-1873), Swiss physicist, was born at Geneva on Oct. 9, 1801. He was the son of Charles Gaspard de la Rive (1770-1834), who became professor of pharmaceutical chemistry at the Academy of Geneva in 1802 and rector in 1823. In 1823 de la Rive was appointed to the chair of natural philosophy in the Academy of Geneva. He devoted himself specially with François Marcat (1803-83), to the investigation of the specific heat of gases, and to observations for determining the temperature of the earth's crust. Electrical studies, however, engaged most of his attention. His experiments on the voltaic cell were of importance in the development of electrical theory, the results were published in 1836. In common with Faraday, de la Rive held the theory that voltaic electricity was due to chemical action. In 1840 he described a process for the electroplating of silver and brass, for which in the following year he received a prize of 3,000 francs from the French Academy of Sciences. Between 1854 and 1858 he published a *Traité de l'électricité théorique et appliquée*, which was translated into several languages. De la Rive's birth and fortune gave him considerable social and political influence. He was distinguished for his hospitality to literary and scientific men, and for his interest in the welfare and independence of his native country. In 1860, when the annexation of Savoy and Nice had led the Genevese to fear French aggression, de la Rive was sent by his fellow-citizens on a special embassy to England, and succeeded in securing a declaration from the English Government, which was communicated privately to that of France. Later (1867) he carried out a series of researches on the discharge of electricity through gases, with observations on the critical pressure and the conductivity of the cathode dark space. He died suddenly at Marseille on Nov. 27, 1873.

DELAROCHE, HIPPOLYTE, commonly known as PAUL, (1797-1856), French painter, was born in Paris on July 17, 1797. He studied under Gros and exhibited for the first time in the Salon of 1822. He visited Italy in 1838 and 1843, when his father-in-law, Horace Vernet, was director of the French Academy. His studio in Paris was in the rue Mazarine, where he never spent a day without some good result, his hand being sure and his knowledge great. His subjects, definitely expressed and popular in their manner of treatment, illustrating certain views of history dear to partisans, yet romantic in their general interest, were painted with a firm, solid, smooth surface, which gave an

appearance of the highest finish. Delarocche held a course midway between the classicists and the romantics. His long series of historical pictures had a great popular success and were made familiar in thousands of homes by engravings of them. Three of them are in the Louvre: "The Death of Queen Elizabeth" (1827), "The Children of Edward IV" (1830), and "The Young Martyr." But his easel pictures no longer have much importance.

In 1837 Delarocche received the commission for the great picture, 27 mètres long, in the hemicycle of the lecture theatre of the École des Beaux-Arts. This represents the great artists of the modern ages assembled in groups on either hand of a central elevation of white marble steps, on the topmost of which are three thrones filled by the architects and sculptors of the Parthenon. To supply the female element in this vast composition he introduced the geni or muses, who symbolize or reign over the arts, leaning against the balustrade of the steps. The portrait figures are nearly all unexceptionable and admirable. This great and successful work is on the wall itself, an inner wall, however, and is executed in oil. It was finished in 1841 and considerably injured by a fire which occurred in 1855, which injury he immediately set himself to remedy (finished by Robert-Flcury), but he died before he had well begun, on Nov. 4, 1856.

See L. Runtz, *Oeuvre de Paul Delarocche*, photographic reproductions, with a notice by H. Delaborde and Jules Goddard (1858). Rees, *Delarocche* (1880).

DELARUE, GERVAIS (1751-1835), French historical investigator, formerly regarded as one of the chief authorities on Norman and Anglo-Norman literature, was a native of Caen who took refuge in England during the French Revolution. His principal works are *Essais historiques sur les Bordes, les Jongleurs, et les Trouvères normands et anglo-normands* (3 vols., 1834), and books on the history of his native town.

DE LA RUE, WARREN (1815-1889), British astronomer and inventor of the photo-heliograph, son of Thomas de la Rue, was born in Guernsey on Jan. 18, 1815. He constructed in 1850 a 13-in. reflecting telescope, mounted first at Canonbury, later at Cranford, Middlesex, and with its aid executed many drawings of the celestial bodies. In 1851 he saw a daguerrotype of the moon by G. P. Bond, shown at the great exhibition of that year. Employing the more rapid wet-collodion process, he succeeded before long in obtaining exquisitely defined lunar pictures, which remained unsurpassed until the appearance of the Rutherford photographs in 1865. In 1854 he turned his attention to solar physics, and in order to obtain a daily photographic representation of the state of the solar surface he devised the photo-heliograph, described in his report to the British Association, "On Celestial Photography in England" (1859), and in his Bakerian Lecture (*Phil Trans vol. cli*). Regular work with this instrument, begun at Kew by De la Rue in 1858, was carried on there for 14 years, and was continued at Greenwich from 1873 to 1882. The results obtained in the years 1862-66 were discussed in two memoirs, entitled "Researches on Solar Physics," published by De la Rue, in conjunction with Professor Balfour Stewart and Mr. B. Loewy, in the *Phil Trans* (vol. clix and vol. cli). The photographs which he took in Spain of the solar eclipse of July 18, 1860, proved beyond doubt the solar character of the prominences or red flames, seen around the limb of the moon during a solar eclipse. In 1873 De la Rue presented most of his astronomical instruments to the university observatory, Oxford, in 1887 he provided it with a 13-in. refractor to enable it to take part in the International Photographic Survey of the Heavens. With Dr. Hugo Müller as his collaborator he published many chemical papers between 1856 and 1862, and investigated, 1868-1883, the discharge of electricity through gases by means of a battery of 14,600 chloride of silver cells. He was twice president of the Chemical Society, and also of the Royal Astronomical Society (1864-66). He died in London on April 19, 1889.

DELATOR, in Rome, one who gave notice (*deferre*) to the treasury officials of moneys due to the imperial *fiscus* (see *AERARIUM*). This meaning was extended to those who lodged information as to punishable offences, and further, to those who brought a public accusation against any person. Although the word *delator* ("common informer") is confined to imperial times,

the right of public accusation had long been in existence. When exercised from patriotic motives its effects were beneficial, but when rewards were introduced this was no longer the case. Cicero expresses his opinion that such accusations should be undertaken only in the interests of the state or for other urgent reasons. Under the empire the system degenerated into an abuse, which reached its height during the reign of Tiberius.

Delatores were drawn from all classes of society. The objects of their attacks were the wealthy, all possible rivals of the emperor and those whose conduct implied a reproach against the imperial mode of life. Special opportunities were afforded by the law of *maiestas* (treason) which (originally directed against attacks on the ruler by word or deed) was made to cover all kinds of irrelevant accusations. The chief motive for these accusations was no doubt the desire of amassing wealth, since by the law of *maiestas* one fourth of the goods of the accused was assured to the accuser (who was hence called *quadruplator*). Pliny and Martial mention instances of enormous fortunes amassed by those who carried on this hateful calling. But it was not without its dangers. If the *delator* lost his case he was liable to the same penalties as the accused, he was exposed to the risk of vengeance at the hands of the proscribed, or of their relatives, while emperors like Tiberius had no scruples about putting out of the way those creatures for whom they had no further use. Under the better emperors severe penalties were inflicted upon the *delatores*.

Titus drove into exile or reduced to slavery those who had served Nero, after they had been flogged in the amphitheatre. The abuse reappeared under Domitian, they were again banished by Trajan, and threatened with capital punishment in an edict of Constantine.

See J. E. B. Mayor's note on Juvenal, iv, 48, for ancient authorities, also J. E. Sandys, *Companion to Latin Studies* (1921), with useful bibliography.

DELAUNAY, ELIE (1828-1891), French painter, was born at Nantes on June 12, 1828, and died in Paris on Sept. 5, 1891. He studied under Jean Flandrin and at the Ecole des Beaux-Arts. He worked in the classicist manner of Jean Ingres until, after winning the Prix de Rome, he went to Italy in 1856, and abandoned the ideal of Raphaellesque perfection for the sincerity and severity of the quattrocentists. As a pure and firm draughtsman he stands second only to Ingres. After his return from Rome he was entrusted with many important commissions for decorative paintings, including the frescoes in the church of St. Nicholas at Nantes, the three panels of "Apollo," "Orpheus" and "Amphion" at the Paris opera house, and 12 paintings for the great hall of the council of state in the Palais Royal. His "Scenes from the Life of St. Geneviève," which he designed for the Pantheon, remained unfinished at his death. The Luxembourg museum has his famous "Plague in Rome" and a nude figure of "Diana," and the Nantes museum, the "Lesson on the Flute." In the last decade of his life he achieved great popularity as a portrait painter.

DELAUNAY, LOUIS ARSÈNE (1826-1903), French actor, was born in Paris, the son of a wine seller. He studied at the Conservatoire, and made his first formal appearance on the stage in 1845, in *Tartuffe* at the Odéon.

Three years later he made his debut at the Comédie Française as Dorante in Pierre Corneille's *Le Menteur*, and began a long and brilliant career in young-lower parts, which he continued to act until he was 60, his grace, marvellous diction and passion enchanting his audiences. He was especially happy in the plays of Alfred de Musset.

Delauay was made a chevalier of the Legion of Honour in 1883, and retired in 1887.

See *Souvenirs de M. Delaunay de la Comédie-Française* (1901).

DELAUVIGNE, JEAN FRANÇOIS CASIMIR (1793-1843), French poet and dramatist, was born in April 1793, at Havre, and was educated in Paris at the Lycée Napoléon. His *Dithyrambe sur la naissance du roi de Rome* (1811) secured for him a sinecure in the revenue office. Inspired by the catastrophe of 1815, Delavigne wrote the stirring patriotic poems entitled

Messéniennes. In 1813 his play *Les veupes Siciliennes*, refused for the Théâtre Français, was performed at the Odéon. In *Le Paria* (1821) he expressed political opinions which led to his deprivation of a comfortable sinecure, but Louis Philippe compensated him by making him librarian at the Palais Royal. Here he wrote the *Ecole des vieillards* (1823), his best comedy, which gained him election to the Academy in 1835. To this period also belong *La Princesse Aurélie* (1828) and *Mario Favier* (1829), a drama in the romantic style.

For his success as a writer Delavigne was in no small measure indebted to the stirring nature of the times in which he lived. The *Messéniennes*, as noted above, had their origin in the excitement consequent on the occupation of France by the allies in 1815. Another crisis in his life and in the history of his country, the revolution of 1830, stimulated him to the production of a second masterpiece, "La Parisienne." This song, set to music by Daniel Auber, was on the lips of every Frenchman, and rivalled in popularity the "Marseillaise." A companion piece, "La Var soviennne," was written for the Poles, by whom it was sung on the march to battle. Other works of Delavigne followed each other in rapid succession—*Louis XI* (1832), *Les Enfants d'Edouard* (1833), *Don Juan d'Autriche* (1835), *Une Famille au temps de Luther* (1836), *La Popularité* (1838), *La Fille du Cid* (1839), *Le Conseiller rapporteur* (1840) and *Charles VI* (1842), an opera libretto partly written by his brother, Germain (1790-1868).

In 1843 he started for Italy in search of health, but died at Lyons on Dec. 11, 1843.

Delavigne's *Poésies* and his *Théâtre* were published in 1863. His *Oeuvres complètes* (new ed., 1885) contains a biographical notice by his brother, Germain Delavigne, who is best known as a librettist in opera. See also Charles Sainte Beuve, *Portraits littéraires*, vol. V, *Favrol, Étude sur Casimir Delavigne* (1894), and F. Vucachez, *Casimir Delavigne* (1893).

DELAWARE, popularly called the "Diamond State," is one of the 13 original states of the United States. It is situated in the eastern part of the peninsula formed by Chesapeake bay and the estuary of the Delaware river, between approximately 38° 27' and 39° 50' N lat and 75° 2' and 75° 47' W long. The state has a length of about 100 mi and an average width of a little more than 20 mi, its total area being 2,057 sq mi, of which 79 sq mi are inland water surface. Excepting Rhode Island, it is the smallest state in the union.

Delaware is bounded north and northwest by Pennsylvania, east by the Delaware river and Delaware bay, which separate it from New Jersey, and by the Atlantic ocean, south and west by Maryland.

Physical Features.—Delaware lies on the Atlantic coastal plain and is for the most part level and low, its average elevation above the sea being about 60 ft. Topographically, the state is two unequal areas, divided by a line following the general course of White Clay and Christina creeks. Northward of this line the country is rolling, with bold hills, moderately deep valleys and rapid streams. Southward, the country is level or gently undulating. West of Wilmington there rises a ridge which crosses the state in a northwesterly direction and forms a watershed between Christina and Brandywine creeks, its highest elevation above sea level being 440 ft at Centerville. South of the Christina there begins another elevation, sandy and marshy, which extends almost the entire length of the state from northwest to southeast and forms a second water parting. Numerous streams drain the state throughout its length. Those of the north flow into Christina and Brandywine rivers, whose estuary into Delaware river forms Wilmington harbour, those of the southwest have a common outlet in the Nantuxcoke river of Maryland, those of the east empty into Delaware bay and the Atlantic ocean. The principal harbours are those of Wilmington, New Castle and Lewes. The shore of the bay is marshy, that of the Atlantic is sandy. In Kent county there are more than 60,000 ac of tidal marshland, some of which has been reclaimed by means of dikes, Cypress swamp, in the extreme south, has an area of 50,000 ac. Hornblende, feldspar, granite of the Brandywine region and kaolin are found in the north. The prevailing soils of the region are clays, sometimes mixed with loam. Next, to the southward, come the

Cretaceous formations and clays suitable for terra cotta manufacture. The soils of this region are mainly loams. The remainder of the state has a sandy soil resting on Tertiary white and blue clays.

Minerals of economic value are found only in the north part of the state. Kaolin, mined chiefly in the vicinity of Hockessin, New Castle county, granite, used for road making and rough construction work, found near Wilmington, and brick and tile clays are the products of greatest importance.

The proximity of the Delaware and Chesapeake bays helps to give Delaware a mild climate. The mean annual temperature is approximately 55° F., ranging from 52° in the S to 56° in the N, and the extremes of heat and cold reported by the U.S. weather bureau are 107° in the summer and -12° in the winter. The annual rainfall, greater on the coast than inland, ranges from 40 to 45 in.

History—Before the coming of the white men, the present state of Delaware was inhabited by tribes of aborigines of the Leni-Lenape stock, later called Delaware Indians. Of an ancient and proud lineage, they were known as the "original people" and bore the familiar name of "grandfathers of the red men." The Nanticokes, occupying the lower part of Delaware and the eastern shore of Maryland, were Algonkin speaking people like the Lenape. The Minquas Indians, an Iroquois tribe, came from the interior to trade.

Henry Hudson discovered Delaware bay and river for the Dutch in 1609. The following year, Capt Samuel Argall of Virginia named the bay for Lord De la Warr, the governor of that colony. After the Dutch lost this, their "South river," the name Delaware survived.

The territory was more thoroughly explored in 1615-16 by Cornelis Hendricksen, whose reports did much to cause the incorporation of the Dutch West India company (q.v.) in 1621. About the time the Puritans were establishing themselves in New England, the first settlement on Delaware soil was made by members of the Dutch company in 1631 near the site of the present *Lewes*. The leaders, one of whom was Capt David P. de Vries, wished "to plant a colony for the cultivation of grain and tobacco as well as to carry on the whale fishery in that region." The settlement, however, was soon completely destroyed by the Indians (see *Lewes*).

When the Dutch West India company failed to meet the expectations of its founder, William Usselinx, he proposed plans for trade and colonization to Gustavus Adolphus of Sweden. Swedish and Dutch interest resulted finally in a jointly financed company and an expedition to the Dutch "South river," the Delaware, in charge of Peter Minuit, former Dutch governor of New Netherland. In 1638, Minuit, who was an investor in the New Sweden company as well as expedition leader, established a settlement at what is now Wilmington, naming it "Fort Christina," in honour of the child queen Christina, and naming the entire territory, bought by Minuit from the Minquas Indians and extending indefinitely westward from the Delaware river between Bombay hook and the mouth of the Schuylkill river, "New Sweden." After the Swedish purchase of Dutch holdings in the New Sweden company, the next settlement was made by a group of Dutch Swedes and Germans in 1641. In 1642, mature plans for colonization were adopted. A new company, officially known as the West India, American or New Sweden company, but also popularly known as the South company, was chartered and a governor Johan Printz (c. 1600-61) was sent out by the crown. He arrived early in 1643 and subsequently established settlements, including one on the island of Truicum at the site of Lexington, Pa., another at the mouth of Salem creek, N. J., and another near the mouth of the Schuylkill river. Printz remained governor of New Sweden for a period of ten years, his mans on, fort and church were on Truicum island. Tension soon arose with New Netherland although the Swedes and the Dutch owing to their common dislike of the English and the common interests of Sweden and the Netherlands in the Thirty Years' War, had in fact attained a formal friendship. In 1651, Peter Stuyvesant, governor of New Netherland, and more aggressive than his predecessors built Ft. Casimir, near what is

now New Castle. In 1654 Printz's successor, Johan Claudius Rysing, who had arrived from Sweden with a large number of colonists, expelled the Dutch from Ft. Casimir. In retaliation, Stuyvesant, in 1655, with seven vessels and several hundred men, recaptured the fort and also captured Ft. Christina (Wilmington). New Sweden thus passed into Dutch control and became a dependency of New Netherland. In 1656, however, the Dutch West India company sold the region including Ft. Casimir to the city of Amsterdam, which in the following year established a settlement called "New Amstel" at Ft. Casimir (New Castle). This settlement, badly administered, made little progress.

In 1663 the whole of the Delaware country came under the jurisdiction of the city of Amsterdam, but in the following year, with New Netherland, was seized by the English. For a brief interval, in 1673-74, the Dutch were again in control, but in the latter year, by the treaty of Westminster, the "three counties on the Delaware" again became part of the English possessions in America held by the duke of York, later James II. His formal grant from Charles II was not received until March 1683. In order that no other settlements should encroach upon his centre of government, New Castle, the northern boundary was determined by drawing an arc of a circle 12 mi. in radius with New Castle as the centre. This accounts for the curved boundary line between Delaware and Pennsylvania. However, in Aug. 1682, the duke of York conveyed the entire territory to William Penn by deeds of feoffment and leases for 10,000 years, a transfer later challenged by Maryland. But differences in race and religion, economic rivalry between New Castle and Pennsylvania towns, and petty political quarrels over representation and office-holding, similar to those in the other American colonies, were so intense that Penn in 1691 appointed a special deputy governor for the "lower counties."

Although reunited with the "province" of Pennsylvania in 1693, the so called "territories" or "lower counties" secured a separate legislature in 1704 and a separate executive council in 1710, the governor of Pennsylvania, however, was the chief executive until 1776. A protracted boundary dispute with Maryland, which colony at first claimed the whole of Delaware under Lord Baltimore's charter, was not settled until 1767, when the present line separating Delaware and Maryland was adopted. In the American Revolution Delaware furnished only two regiments to the American Continental army, but they were among the best in the service. One of the companies of the first regiment carried a number of gamecocks said to have been the brood of a blue hen, hence the soldiers, and later the people of the state, have been popularly known as the "Blue Hen's Chickens," though the state itself, as already mentioned, is popularly called the "Diamond state."

Although Washington's whole army entered the state of Delaware and was encamped near Newport with a view to blocking Gen. Howe's march to Philadelphia after the landing of the latter's army at the head of the Elk in Aug. 1777, only a brisk skirmish at Cooch's Bridge (contemporaries called it Cooch's Mill) was fought on Sept. 3 between the American light infantry under Gen. Maxwell and some British detachments. Having encamped near Newark, Del., for five days, Howe marched through that town toward Kennett Square, Pa., in an effort to flank Washington's army, causing the American commander to march his men behind the Brandywine river in order to confront Howe at Chadd's Ford. (See *BRANDYWINE*.)

In 1776 a state government was organized, and the name "Delaware State" was first adopted. In the constitution of 1792 the title was changed to "State of Delaware." One of the peculiarities of the government under the first constitution was that, in addition to the regular executive, legislative and judicial departments, there was a privy council without whose approval the governor's power was little more than nominal. In 1786 Delaware was one of the five states whose delegates attended the Annapolis convention (see *ANAPOLIS CONVENTION*) and it was the first (Dec. 7, 1787) to ratify the federal constitution. The state was strongly Federalist for 30 years after the adoption of the federal constitution, and in several presidential elections stood almost alone in choosing Federalist electors. This strong Federalist influence

caused the state to oppose the War of 1812, but after war was declared it loyally supported the union. The slavery sentiment of the state was never strong, as was shown by the assembly's passing a resolution favouring the restrictions placed on further slave expansion by the Missouri Compromise and in 1845 passing a resolution against the annexation of Texas. In 1860 the state cast its electoral votes for John C. Breckinridge, as it was thought he represented the most neutral stand on the question of slavery.

A further effort was made to prevent the rupture on the slave question when the general assembly, in 1861, went on record as favouring the Crittenden compromise (see CRITTENDEN, JOHN JORDAN). In 1850 the Democrats, who had before then elected a few governors and United States senators, secured control of the entire administration—a control unarrested, except in 1863, until the last decade of the 19th century. Although it was a slave state, the majority of the people of Delaware opposed secession in 1861, and the legislature promptly answered President Lincoln's call to arms.

In 1865, 1867 and 1869, respectively, the legislature refused to ratify the 13th, 14th and 15th amendments to the federal constitution. The provision of the state constitution restricting suffrage to those who had paid county or poll taxes and made the tax lists the basis for the lists of qualified voters, opened the way for the disfranchisement of many Negroes by fraudulent means.

Consequently the levy court of New Castle county was indicted in the United States circuit court in 1872, and one of its members was convicted. Again in 1880 the circuit court, by virtue of the federal statute of 1872 on elections, appointed supervisors of elections in Delaware. The Negro vote increased in importance until 1900, when it was approximately one fifth of the total vote of the state, since then it has declined, because of decrease in the percentage of Negro population. In 1901 the legislature ratified the three federal amendments concerning the status of the Negro rejected in former years. Another political problem was representation in the legislature. Since colonial days the unit, from which members were elected at large, had been the county, inasmuch as the population of New Castle county after 1870 exceeded that of both Kent and Sussex, the inequality became a cause of discontent. This was partly eradicated by the new constitution of 1897, which reapportioned representation according to electoral districts, so that New Castle has 7 senators and 15 representatives, while each of the other counties has 5 senators and 10 representatives.

In 1889 the Republicans for the first time since the Civil War secured a majority in the legislature, Anthony J. Higgins (Republican) was elected to the United States senate. Internal dissensions in the Republican party, arising out of a struggle between the so-called Regular Republicans and a personal "machine" built up by J. Edward Addicks, a Wilmington capitalist, prevented the legislature from electing a senator in 1895. The next election brought the Democrats into power, and the vacancy was filled by Richard R. Kenney. The struggle between the Republican factions continued, and with the expiration of Senator Gray's term in 1899 an election was again prevented. The state was wholly without representation in the United States senate from the expiration of Senator Kenney's term in 1901 until 1903, when a compromise was effected whereby two Republicans, one of each faction, were chosen. Again in 1905 the legislature adjourned without being able to fill a vacancy in the senate. The deadlock, however, was broken at a special session of the legislature called in 1906 when in June of that year Henry A. du Pont was elected senator.

Between the Civil War and 1913, conservatism characterized the state. Proposed advances in the administration of government and in provisions for public health, education, and the general welfare received little support in spite of efforts of civic groups and individuals in the promotion of civic ideals. Marked progress began with the administration of Gov. Charles R. Miller (1913-17) and Gov. John G. Townsend Jr. (1917-21). The initiatives proposed and achieved during these terms continued with little interruption on during the depression of World War II. Popular participation in movements for civic betterment greatly increased after that war.

Development of the modern state was marked by the tendency

to base change and reform upon thorough study by experts and to increase efficiency of operation of state and local agencies by employment of trained personnel. A second trend toward efficiency was the provision of adequate buildings for public offices and departments. Concern for architectural merit and pleasing environment gave the state capital, Dover, a well planned administrative area and Wilmington its distinguished Rodney square and marine terminal.

Preservation of historic buildings and sites became an increasing state wide interest during and after the 1930s. In 1931 the tercentenary of the first white settlement was celebrated at Lewes, the Dutch Swanendael, in 1938 the tercentenary of the first permanent settlement, Swedes and Finns at Wilmington, in 1951 the tercentenary of the founding of New Castle by Dutch settlers and their establishment of the first elements of self government on Delaware soil.

Government.—The constitution by which Delaware is governed was adopted in 1897. Like the constitutions of 1776, 1792 and 1831, it was promulgated by a constitutional convention without submission to the people for ratification, and amendments may be adopted by a two-thirds vote of each house in two consecutive legislatures. Fifteen amendments had been adopted to 1951. The property qualification of state senators and the restriction of suffrage to those who had paid county or poll taxes were abolished, but suffrage was limited to adults who can read the state constitution in English and, unless physically disqualified, can write their names, and who have registered. In 1907 an amendment to the constitution was adopted which struck out from the instrument the clause requiring the payment of a registration fee of \$1 by each elector.

Important innovations in the constitution of 1897 were the office of lieutenant governor and the veto power of the governor, which extends to parts and clauses of appropriation bills, a bill may be passed over his veto by a three-fifths vote of each house of the legislature, and a bill becomes a law if not returned to the legislature within ten days after its reception by the governor, unless the session of the legislature shall have expired in the meantime.

The governor's regular term in office is four years, and he is ineligible for a third term. All his appointments to offices where the salary is more than \$500 must be confirmed by the senate, all pardons must be approved by a board of pardons. Elected officers in addition to the governor and lieutenant governor are attorney general, state treasurer, auditor of accounts and insurance commissioner. Appointed by the governor are the judges, the secretary of state, bank commissioner, liquor commissioner, adjutant general and other officers, boards and commissions. A commission created by the 1946 legislature to survey the executive department for more efficient organization reported to the 1951 legislature a plan for consolidation of 92 executive agencies into 8 staff and 11 operating departments and agencies under direct control of the governor.

The constitution requires that a general election be held every two years on the Tuesday next after the first Monday in November and further provides against violations of the honesty and freedom of elections in detail and with heavy penalties.

Representation in the legislature is according to districts, there being ten districts in each county for the election of members in the lower house for two years, and five senatorial districts in each county for the election of members in the upper house for four years, in addition, the city of Wilmington, which is in New Castle county, has five representative districts and two senatorial districts. In November 1950 the people of the state voted to amend the constitution to provide for a general election every two years on the Tuesday next after the first Monday in November and further provided against violations of the honesty and freedom of elections in detail and with heavy penalties.

by the governor, with the consent of the senate, for a term of 12 years.

Certain of the judges hold courts of chancery, general sessions, oyer and terminer, and orphans' courts, the seven together constitute the supreme court, but the judge from whose decision appeal is made may not hear the appealed case unless the appeal is made at his own instance.

In 1949 a proposed constitutional amendment creating a separate supreme court provided the first legislative step.

Corporations may be created under general law only, and no corporation may issue stock except for an equivalent value of money, labour or property. The well-interpreted "general corporation law of the state," kept broad in its provisions, combines liberal policy with stability. Use of the word "trust" in the title of corporations is limited to those having trustee or banking business which are under the supervision of the bank commissioner and are required by law to make at least two reports each year to the commissioner.

The major units of local government are the counties, of which Delaware has only three: New Castle, Kent and Sussex. The colonial division of the counties into "hundreds," derived from the English districts of King Alfred's day, persists, although these districts, formerly corresponding to the townships of Pennsylvania, have lost most of their governmental functions.

The state has no unified penal system and no state prison. County jails are maintained in Kent and Sussex counties and a county workhouse in New Castle county. The latter receives some long-term prisoners from the other counties. The whipping post was still maintained in Delaware at mid-20th century, and laws on the statute books prescribed whipping for a number of crimes and misdemeanours. The courts have been forbidden to impose sentence of whipping on females since 1889, and beginning in 1889 under increasing discretionary powers granted the courts, judges tended to avoid sentencing prisoners to be lashed. When imposed, this penalty usually has been for larceny, robbery, or occasionally wife-beating.

By decision of the United States supreme court in 1934 the boundary dispute between Delaware and New Jersey which had almost led to an open "oyster war" was settled. The court upheld Delaware's claim to territory as far as the low water mark on the New Jersey shore within a 12-mi radius of New Castle. Farther down the Delaware river, however, it decreed that the boundary should follow the centre of the ship channel and not, as Delaware had contended, the geographic middle of the river. New Jersey thus succeeded in establishing its right to certain oyster beds.

Population.—The population of Delaware in 1790 was 59,096, in 1830 it was 76,748, in 1870, 125,015, in 1910, 202,322, in 1940,

BY COURTESY OF THE U. S. BUREAU OF THE CENSUS

URBAN AND RURAL POPULATION OF DELAWARE 1870 TO 1950
The crosshatched part of the 1950 bar represents the population of the additional areas counted as urban under the new 1950 definition.

266,505, and in 1950, 318,085. This last figure represents an increase of 19.4% over the population in 1940. The population per square mile in 1950 was 160.8, as compared with 134.7 in 1940 and with 50.7 for the U.S. in 1950.

Of the 1950 population 147,990, or 46.5% lived in incorporated places of 2,500 or more, as compared with 52.5% in 1940, when these places constituted the urban area. The entire urban

population, under a new definition set up for 1950 which included also the thickly settled suburban area, or urban fringe, adjacent to Wilmington, amounted to 199,121, or 61.6% of the state total.

Area	Population			Per cent of total	
	1950	1940	1930	1940-30	1950-40
The state	318,085	266,505	215,380	19.4	11.5
Urban*	199,121	150,119	117,142	46.5	51.2
Rural*	118,964	127,073	115,711	0.1	10.3
Per cent urban	61.6	53.3	51.7		
Principal cities					
Wilmington	110,340	112,501	106,007	1.8	5.5
Dover	6,3	5,517	4,800		11.9

*Final figures for 1950 based on new definition. See comment in text.

The number of households in 1950 was 90,362, as compared with 70,541 in 1940.

The average population per household had declined from 3.8 in 1940 to 3.5 in 1950.

The population of the state was distributed by colour and nativity in 1950 as follows: 81.7% native white, 4.4% foreign born white, and 13.9% nonwhite, practically all Negro. There were 96.8 males per 100 females in the native white population, and 101.4 in the Negro population, 8.3% of the population was 65 years old or over, and 54.6% of the population 14 years old and over was in the labour force.

Of the total number of employed males, 11.5% was engaged in agriculture, 11.3% in construction, 34.0% in manufacturing and 22.2% in transportation and trade.

Finance and Taxation.—The fiscal system of the state is based upon operation from current revenues and serial bonds for permanent improvements. Modern budget procedure governs the biennial appropriations for the expenses of all regular agencies and departments. A state tax department provides an efficient system of tax collection. The chief sources of revenue are: graduated income tax, franchise, inheritance and estate taxes, business and occupation licences, permits and motor fuel taxes and federal grants. There is no state real estate tax.

State revenue for the fiscal year ending June 30, 1950, was \$37,579,930, nonrevenue income \$40,243,722, cash balance from the previous fiscal year, \$13,527,305. Appropriations included education \$8,840,728, public welfare \$3,165,740, highways \$3,886,900.

On Dec. 31, 1950, Delaware's state and national banks had assets of \$694,960,000, an increase for the year of \$65,000,000. Deposits in state banks were \$582,000,000, an increase of \$39,000,000.

Education.—The constitutional provision for the maintenance of a public-school system required separate schools for white and Negro children, with additional provision that no distinction be made in financing schools, on account of race or colour. The first public-school law, passed in 1829, was based largely on the principle of "local option," each school district being left free to determine the character of its own school or even to decide against having any school at all.

This system was replaced in 1875 by creation of a state board of education and a further step toward uniform administration under a state superintendent. Although the state temporarily reverted to decentralized administration in 1888 and the subsequent progress was halting and intermittent, the state was ready in 1919 and 1920 for the adoption of a modern school code. This code was progressively amended, and the public school system developed rapidly to high rank among the states in administration and facilities, including scientifically designed buildings.

Outstanding advances were a state program of vocational education, a uniform state supported salary schedule for all personnel from clerical to administrative and a unit plan of allocation of state funds.

In the fiscal year 1950 the cost of operating the public schools was \$10,131,119 (state appropriation \$8,686,623, supplemented by local taxation). Expenditure per pupil was \$243.42. The average salary of class room teachers was \$3,379. The state had 142 elementary schools with a teaching staff of 952 for the 28,423 pupils enrolled, 47 secondary schools with a teaching staff of 879

for 16,923 pupils Compulsory attendance was 160 days In 1949 legislative appropriation for school buildings was \$13,700,000

Major contributions to the state's educational development were the good roads program inaugurated by T. Coleman du Pont, who gave the state a model highway costing \$4,000,000, and schools built by Pierre S. du Pont, costing \$9,000,000 and made possible by the roads

OLD SWEDS CHURCH AT WILMINGTON, DELAWARE BUILT IN 1698 BY SWEDISH COLONISTS AND STILL USED AS A PLACE OF WORSHIP

Delaware college at Newark, founded as Newark college in 1833 served as the state's only institution of higher education until 1859, when it closed. Reopened in 1870 as a land grant college, it received in addition to federal and private funds, appropriations from the state for permanent improvements and in 1913 became wholly state owned. From that year, gifts and bequests in addition to regular funds contributed to a great expansion in facilities.

In 1913 the Women's college was founded and affiliated with Delaware college, with the same faculty, but entirely separate in buildings, classes and student organizations. In 1921 the two colleges were incorporated as the University of Delaware. The fully reorganized university became completely co educational in 1944. The faculty in 1950-51 numbered 520. The total value of university property in 1950 was \$7,000,000, the income for the fiscal year 1950 was \$1,293,286. The total undergraduate attendance in 1950-51 was 1,332 men and 583 women. Graduate students numbered 583. Area of campus and farm is 500 ac. The agricultural experiment station, established 1888, and its agricultural extension division became affiliated with the university's school of agriculture. By taking advantage of the annual summer sessions, students in agriculture and other schools may graduate in three years.

Delaware State college near Dover, established in 1891 as a land grant college for Negro students, awards bachelor degrees in arts, science, education, home economics, agriculture and industrial arts. Students may do graduate work at the University of Delaware, also undergraduate work if the facilities of State college fall below those of the university.

Welfare and Correction—State agencies provide a broad program of health and welfare. Of major importance are the state board of health, state board of welfare (children), old age welfare commission, which grants old age pensions, operates the state welfare home (for aged and homeless poor) and administers outside relief, Delaware State Hospital (for the mentally ill), one of the country's most advanced institutions, and the Governor Bacon health centre, a 320 ac estate with buildings for the specialized care and treatment of children and adults who are victims of infantile paralysis, spastics and cardiacs, alcoholics and bedridden aged. Other state agencies care for the blind, deaf, dumb, tubercular and feeble minded. Kent and Sussex county jails and the New Castle county workhouse are the only penal institutions. Juvenile courts in Kent and Sussex counties and the family court

of New Castle county exercise correctional jurisdiction over delinquent children and youth. Three state training schools provide academic and vocational education for delinquent children and youth. These are Ferns school for white and Negro boys, Kruse school for Negro girls and Woods Haven for white girls.

Sterilization of the feeble-minded, epileptic and insane is provided for by law.

Industry, Trade and Transportation—Delaware's population was chiefly rural and agricultural until 1920, when the urban population exceeded the rural for the first time. This change in population ratio was in a great measure due to rapid industrial development during World War I. The development of agriculture was also rapid. In 1929 the value of all farm crops and livestock sold, traded, or used by farm households amounted to \$21,201,961. In 1945 the total cash farm income was \$93,445,000. In 1949 total cash farm income was \$97,817,000. Of this income, \$60,610,000 was from the broiler industry, making Delaware rank first in this product. In 1949-50 the state ranked second highest in farm income per county.

Crop production in 1949 included corn, 4,380 bu., wheat, 1,202,000 bu., apples, 624,000 bu., tomatoes (processed) 25,800 tons, lima beans, shelled, 16,200 tons, strawberries, 63,000 crates. The extensive peach culture which for several decades before 1900 gave Delaware the name of the "Peach state" remained a minor source of farm income, peaches representing 41% of all fruit trees.

The number of farms in 1945 was 9,296, comprising 70 3/4% of the total land area of the state. The majority of farms ranged from 50 to 350 ac. There is no state tax on real estate in Delaware. The county taxes vary from 35 cents to 65 cents per \$100 of assessed value.

The development of manufacturing in Delaware—centred largely within the northern part of New Castle county, including Wilmington and the river shore north and south of the city, New Castle and Newark—had its origin in the abundant water power from the streams and easy access to the state's great waterway, the Delaware river. Wilmington, an active shipbuilding and shipping port and centre of mill industries from colonial days, expanded after the Civil War into a notable centre for such special industries as carriage and car building, fibre and paper making and machine tool production with the growth of its regular gun powder, textile, leather and iron manufacturing. Early industries along the millstreams of the adjoining county added to the Wilmington area's potential facilities for increased industrial importance during and following World War I. Throughout the state canning and other food processing developed into a major industry. Production of nylon, chemicals, motor vehicles and parts, aircraft, and steel and iron manufacturing and shipbuilding reached their peaks during and after World War II. During this period Wilmington became an outstanding chemical centre of the world with rapidly expanding experimental stations for basic and applied research. Additions in this field to one company, E. I. du Pont de Nemours & Co., cost \$30,000,000 to build and equip after the war.

In 1950 the chemical industry was responsible for the largest increase in employment in the Wilmington area. Second largest was that of plants supplying the building trades.

The U. S. business census, 1947, reported value added by manufacturing as \$182,088,000 for 482 plants, of which \$121,594,000 was in 251 plants in New Castle county. In the fiscal year ending June 30, 1950, the gross receipts of the state's 979 licensed manufacturers amounted to \$285,273,053. Of the total, food accounted for \$67,461,551, clothing \$75,811,666, drugs and medical supplies \$3,274,467, motor vehicle production and supplies, \$10,217,693, miscellaneous, including chemicals, building supplies, textiles, latex, fibre and machinery, \$126,934,254. Stone, clay and sand products, commercial fishing, and merchantable timber and wood products in the 1945-50 period showed a degree of recovery toward former importance. Manufacture of fertilizers also continued to grow.

Delaware's transportation facilities include the water-borne traffic of the Delaware river and the Delaware and Chesapeake sea-level canal connecting the Delaware with Chesapeake bay, the

marine terminal at the port of Wilmington with wharf facilities for the largest ocean vessels, airports with passenger and freight service, 3,910 mi. of main highways and connecting roads and approximately 300 mi. of railways. The Pennsylvania, the Baltimore and Ohio and the Reading railway systems cross the northern part of the state. The Pennsylvania system also runs the length of the state below Wilmington and serves the whole of the Del Mar Va peninsula. The Delaware system of wide dual highways and paved secondary roads connects with all adjoining state systems and with New Jersey by ferry at New Castle and a new \$40,000,000 suspension bridge across the Delaware a few miles north of the ferry point.

The Delaware and Chesapeake canal, 19 mi. long and 90 ft. wide, owned and operated by the federal government, is part of the eastern inland waterway system. Tonnage through the canal was 7,414,761 in 1950, transits of vessels, 14,506. Tonnage at the port of Wilmington was 692,042, value of cargoes, \$34,972,934. Lewes, with its 300 ac. of artificial harbour, provides pilot service for river shipping. Regular lines at the New Castle county airport carried 91,122 lb. of air mail, 270,468 lb. of air express and 764,415 lb. of air freight in 1950. Flights of passenger planes numbered 11,776.

Ryden (1933), contains important material on Delaware's part in the American Revolution. For articles on political conditions since the Civil War see vol. cxix of the *North American Review*, vol. xxxix of the *Forum*, and vol. lxxxi of the *Outlook*—all published in New York. In part ii of the *Report of the Superintendent of the U.S. Coast and Geodetic Survey for 1893* (Washington, 1905) there is "A Historical Account of the Boundary Line between the States of Pennsylvania and Delaware," by W. C. Hodgkins. See also *Delaware, A Guide to the First State* by the Federal Writers' Project of WPA (1938). Some colonial records are preserved with those of New York and Pennsylvania. Others, together with state records, are in the Delaware Public Archives in Dover, Del.

DELAWARE, a city of central Ohio, U.S.A., 24 mi. N. of Columbus, on the Olentangy river, the county seat of Delaware county.

The city is on federal highways 23, 36 and 42, and is served by the Big Four, Chesapeake and Ohio and the Pennsylvania railways. The population was 11,783 in 1950 and in 1940 was 8,944. The city is built on rolling ground, 900 ft. above sea level. It is the seat of the Ohio Wesleyan university, founded in 1847 by the Ohio Conference of the Methodist Episcopal church. Delaware was laid out in 1808 and incorporated in 1815. It was the birthplace of President Hayes.

DELAWARE AND HUDSON COMPANY, THE, a holding company, formerly the oldest operating railway company in America, and a large anthracite carrier, founded by William and Maurice Wurts, Philadelphia merchants, who discovered and acquired anthracite lands in the Lackawanna valley, Pennsylvania, for replacing English coal cut off by the War of 1812. It was

chartered in New York, on April 23, 1823, as "The President, Managers and Company of the Delaware and Hudson Canal Company," which built a canal, Rondout, New York, to Honesdale, Pennsylvania, in 1828, aided by a loan of credit of the State of New York in the amount of \$800,000, and a railroad, Honesdale to the coal beds at Carbondale, Pennsylvania, on which the "Stourbridge Lion," the first locomotive to run on an American railroad, made its famous trial trip on August 8, 1829. The name was changed by act of the New York legislature, passed on April 28, 1890. The canal was abandoned and its cost charged off in 1898. Coal ownership was greatly enhanced by acquisition and lease, after the Civil War, of additional coal properties, at a later time transferred to a wholly owned subsidiary.

By obtaining control of numerous railroads and some construction, the company built up a railway system extending from Plymouth, Pennsylvania, by way of Albany and Schenectady to Rouses Point, New York, at the Canadian border, with branches to Binghamton, Troy, Lake George, Lake Placid, New York, and Rutland, Vermont, and other points, a total of 857.85 miles, consisting of 324.53 owned, 440.51 leased and controlled, and 92.81 trackage rights. On April 1, 1930, the railroad operations were transferred to "The Delaware and Hudson Railroad Corporation," a wholly owned subsidiary, chartered December 1, 1928, in New York.

The company also owns a railroad in Canada, operating 27.11 miles.

(J H N R)

DELAWARE INDIANS, tribes that occupied the drainage of the river Delaware and the shores of Delaware bay, eastern United States. They called themselves Lenape or Leni-Lenape, and were an association or confederacy of three Algonkin tribes, the Munsee, Unami and Unalachtigo. Their speech seems to have been more similar to the Algonkin dialects of Ohio valley than to the adjacent ones of the Atlantic coast, and their own tradition, in the Walam Olum, brings them out of the west. They were friendly to the whites, but, conquered in 1720 by the Iroquois and their lands more and more encroached on by the English settlers, they began to move westward, successively to central and western Pennsylvania, Ohio, Indiana, Missouri, Texas, Kansas and Oklahoma, with branches in Wisconsin and Ontario. They mixed with other Indian remnants in these migrations and the survivors contain much tribally alien blood. Though not particularly powerful or aggressive at the time of discovery, the Delaware were accorded an honorific pre-eminence by the other eastern Algonkins and were called "Grandfathers." See D. G. Brinton, *The Lenape and their*

DELAWARE LACKAWANNA AND WESTERN RAILROAD COMPANY, THE

providence (now Scranton), Pa., to the Susquehanna river at Great Bend, Pa., to provide an outlet for the anthracite coal and the iron of the Lackawanna valley.

During its early history the road was mainly an anthracite coal carrier, but the inauguration of a comprehensive scheme of improvements subsequent to 1899 enabled the company to handle a larger volume and greater diversity of freight and passenger traffic. In 1899 anthracite coal comprised 53% of all freight traffic, in 1939 it represented but 31%. Revenue in 1899 from transportation of passengers was \$3,951,051, in 1939 \$6,649,041. The gross transportation revenue in 1939 was \$50,454,438, the capital cost, \$87,407,500. Over 60,000 passengers are transported daily over the Lackawanna's New Jersey suburban lines in and out of New York City. Electrification between Hoboken and Dover, N.J. was completed in 1931. Through service is operated to Cleveland and Chicago via the Nickel Plate road, and to Detroit and Chicago via the Michigan Central railroad.

(J M D)

DELAWARE RIVER, a stream of the Atlantic slope of the United States, meeting tidewater at Trenton (N.J.), 130 mi above its mouth. Its total length, from the head of the longest branch to the capes, is 410 mi, and above the head of the bay its length is 296 mi. It constitutes in part the boundary between Pennsylvania and New York, the boundary between New Jersey and Pennsylvania, and, for a few miles, the boundary between Delaware and New Jersey. The main or west branch rises in Schoharie county (N.Y.), about 1,886 ft above the sea, and flows tortuously through the plateau in a deep trough until it emerges from the Catskills. Other branches rise in Greene and Delaware counties, New York. In the upper portion of its course the varied scenery of its hilly and wooded banks is exquisitely beautiful. After leaving the mountains and plateau, the river flows down broad Appalachian valleys, skirts the Kittatinny range, which it crosses at Delaware water gap, between nearly vertical walls of sandstone, and passes through a quiet and charming country of farm and forest, diversified with plateaus and escarpments, until it crosses the Appalachian plain and enters the hills again at Easton (Pa.). From this point it is flanked at intervals by fine hills, and in places by cliffs, of which the finest are the Nockamixon rocks, three miles long and more than 200 ft high. At Trenton there is a fall of eight feet.

Below Trenton the river becomes a broad, sluggish inlet of the sea, with many marshes along its side, widening steadily into its great estuary, Delaware bay. Its main tributaries in New York are Mongaup and Neversink rivers and Callicoon creek, from Pennsylvania, Lackawanna, Lehigh and Schuylkill rivers, and from New Jersey, Rancocas creek and Musconetcong and Maurice rivers. Commerce was once important on the upper river, but only before the beginning of railway competition (1857). Of the various early canals only two are of any importance now, the canal from Trenton to New Brunswick which unites the waters of the Delaware and Raritan rivers and the Delaware and Chesapeake canal which joins the waters of the Delaware with those of Chesapeake bay. The magnitude of the commerce of Philadelphia has made the improvements of the river below that port of great importance.

At a cost of many millions of dollars to the U.S. Government a 32 ft channel 600 ft wide has been opened from the deep water in Delaware bay to Philadelphia and a 12 ft channel from there to Trenton.

DELAWARE WATER GAP, a borough and summer resort of Monroe county, Pa., U.S., on the Delaware river, about 85 mi N of Philadelphia and about 88 mi W by N of New York on federal highway 611. Population (1950) 734, (1940) 410, (1930) 443. It is served directly by the Delaware, Lackawanna and Western railway. The borough was named from the neighbouring gorge. On the New Jersey side of the river is Mt. Tammany (about 1,600 ft), a cliff of which has been weathered into the profile of an Indian, once so common to this section. On the Pennsylvania side Mt. Minni rises approximately 1,500 ft.

The river elevation is about 300 ft. The gap, some two miles long, is the result of erosion by a river which once flowed northward acting along a line of faulting at right angles to the strike of the tilted rock formations. The river's present course is thought to be young geologically, and the gap exposes Ordovician, Silurian and Devonian strata.

One of the fine remnants of the Wisconsin terrain that remains in the Delaware valley is the Delaware water gap, a narrow opening in the Kittatinny range, through which the river flows. The gap is about 1,500 ft high, and is a fine example of the work of erosion.

DE LA WARR or **DELAWARE**, a family of the name of Poitiers, died in 1370, and the male line of the family became extinct on the death of Thomas, 5th baron, in 1426.

The 5th baron's half sister, Joan, married Thomas West, 1st Lord West (d. 1405), and in 1415 her second son, Reginald (1394-1451) succeeded his brother Thomas as 3rd Lord West. After the death of his uncle Thomas, 5th Baron De La Warr, whose estates he inherited, Reginald was summoned to parliament as Baron La Warr, and he is thus the second founder of the family. His grandson was Thomas, 3rd (or 8th) baron (d. 1525), a courtier during the reigns of Henry VII and Henry VIII, and the latter's son was Thomas, 4th (or 9th) baron (d. 1472-1554). The younger Thomas was a very prominent person during the reigns of Henry VIII and Edward VI. He died without children in Sept. 1554, when his baronies of De La Warr and West fell into abeyance. His monument may still be seen in the church at Broadwater, Sussex. He had settled his estates on his nephew William West (c. 1519-95), who was disabled by act of parliament (1549) from succeeding to his honours for having sought to poison his uncle. However, in 1570 he was created by patent Baron De La Warr. In 1596 his son Thomas (c. 1550-1602) claimed precedence in the baronage as the holder of the ancient barony of De La Warr, and his claim was admitted.

THOMAS WEST, 3rd or 12th Baron De La Warr (1577-1618), British soldier and colonial governor in America, was born on July 9, 1577, and succeeded to the title in 1602. He fought in Holland and in Ireland under the earl of Essex. He was imprisoned for complicity in Essex's revolt (1600-01), but was exonerated. He became a member of the council of the Virginia company and was appointed (1606) governor and captain general of Virginia for life. Sailing in March 1610 with three ships, 150 settlers and supplies, he arrived at Jamestown on June 30, in time to intercept the colonists who had embarked for England and were abandoning the enterprise. Lord De La Warr's rule was strict but just; he constructed two forts near the mouth of the James river, rebuilt Jamestown, and in general brought order out of chaos. In March 1611 he returned to London, where he published, at the request of the company's council, his *Relation of the condition of affairs in Virginia* (reprinted 1859 and 1868). He remained in England until 1618, when the news of the tyrannical rule of the deputy, Samuel Argall, led him to start again for Virginia. He embarked in April, but died *en route* on June 7, 1618, and was buried at sea. The Delaware river and the State of Delaware were named in his honour. A younger brother, Francis (1586-c. 1634), was prominent in the affairs of Virginia, and in 1627-28 was president of the council, and acting governor of the colony.

In 1761 the 3rd or 12th baron's descendant, John, 7th or 16th Baron De La Warr (1693-1766), was created Viscount Cantelupo and 1st Earl De La Warr. He was a prominent figure in the House of Lords, at first as a supporter of Sir Robert Walpole. He also served in the British army and fought at Dettingen, and was made governor of Guernsey in 1752.

George John West, 5th earl (1791-1869), married Elizabeth Sackville, and in 1843 he and his sons took the name of Sackville-West. The earl was twice lord chamberlain to Queen Victoria, and he is celebrated as "Fair Euryalus" in the *Childs Recollections of his schoolfellows*, Lord Byron. His son, Charles Richard (1815-73), 6th earl, served in the first Sikh war and in the Crimea, and being unmarried was succeeded by his brother Reginald (1817-96) as 7th Earl De La Warr. In 1896 the 7th earl's son, Gilbert George (1869-1915) became 8th Earl De La Warr. He was succeeded as 9th earl by his son, Herbrand Edward (b. 1900).

See G. E. C. (okayne), *Complete Peerage* (1887-95).

DELBROCK, HANS (1848-1929), German historian, was born at Bergen on the island of Rugen on Nov. 11, 1848, and studied at the universities of Heidelberg and Bonn. He saw active service in the Franco-German War, and was afterward tutor to Prince Waldemar of Prussia (1874-79). In 1885 he became professor of modern history in the university of Berlin. From 1884-90 he sat as a conservative in the German reichstag. Delbruck's writings are chiefly concerned with the history of the art of war, his most ambitious work being his *Geschichte der Kriegskunst im Rahmen der politischen Geschichte* (first section,

Das Altertum, 1900, second *Romer und Germanen*, 1902, third, *Das Mittelalter*, 1907, fourth vol, 1921.) Among his other works are *Die Perserkriege und die Burgunderkriege* (Berlin, 1887), *Historische und politische Aufsätze* (1886), *Erinnerungen, Aufsätze und Reden* (1902), *Die Strategie des Persiles erläutert durch die Strategie Friedrichs des Großen* (1890), *Die Polenfrage* (1894), *Das Leben des Feldmarschalls Grafen Neithardt von Gneissau* (1882 and 1894), *Krieg und Politik* (3 vols., 1919), *Ludendorff, Tirpitz, Falkenhayn* (1920), *II eltschichte* (1923-26, 3 vols.) and *Vor und Nach dem Weltkrieg* (1926) Delbrück began in 1883 to edit the *Preussische Jahrbücher*, in which he has written many articles, including one on "General Wolsley über Napoleon, Wellington und Gneissau," and he has contributed to the *Europäischer Geschichtskalender* of H. Schulthess. After the World War he was appointed member of the commission to publish German archives. He died July 14, 1929.

DELBRÜCK, RUDOLF VON, Prussian statesman (1817-1903), was born at Berlin on April 16, 1817. On completing his legal studies he entered the government service in 1837, in 1848 he was transferred to the ministry of commerce. Both Germany and Austria had realized the influence of commercial upon political union. Delbrück in 1851 induced Hannover, Oldenburg and Schumburg Lippe to join the Zollverein, and the southern states, which had agreed to admit Austria to the union, found themselves forced in 1853 to renew the old union, from which Austria was excluded. Delbrück now began, with the support of Bismarck, to apply the principles of free trade to Prussian fiscal policy. In 1861 he concluded an important commercial treaty with France. In 1867 he became the first president of the chancery of the North German Confederation, and represented Bismarck on the federal tariff council (Zollbundesrat). In 1868 he became a Prussian minister without portfolio. In Oct. 1870, when the union of Germany under Prussian headship became a practical question, Delbrück was chosen to go on a mission to the South German states, and contributed greatly to the agreements concluded at Versailles in November. In 1871 he became president of the newly constituted *Reichskanzleramt*. Delbrück, however, began to feel himself uneasy under Bismarck's leanings towards protection and state control. On the introduction of Bismarck's plan for the acquisition of the railways by the state, Delbrück resigned office, normally on the ground of ill-health (June 1, 1876). In 1879 he opposed in the *Reichstag* the new protectionist tariff, and then retired definitely from public life. In 1896 he received from the emperor the order of the Black Eagle. He died at Berlin on Feb. 1, 1903.

See his *Lebenserinnerungen 1817-1867* (2nd ed., 1905), with an additional section on the events of 1870.

DELCASSÉ, THEOPHILE (1852-1923), was born at Pamiers (Ariège) on March 1, 1852, his father being an *hussier* or *baillif*. He was educated locally, took his degree of *licence ès lettres*, and served as tutor to the children of an official in the ministry of foreign affairs. The taste for politics was ingrained in young Delcassé. He contributed to the *République Française* under Gambetta, made friends, if not with the Tribune himself, at least with Camille Barrère who acted as foreign editor of the paper, besides fulfilling the function of French representative on the Danube commission, and became secretary to Massip, a wealthy man who had been elected to the chamber in the Ariège department. Eventually, he married Massip's widow and, in 1889, succeeded him in the Chamber. Freed once for all from all mat-

ter and minister of the colonies from May 1894 to Jan. 1895, after the Colonial Office had been transformed for his sake into a separate and independent ministerial department.

But the real career of Delcassé began in June 1898 after the general election of that year and the overthrow of the Méline cabinet, with his appointment as minister of foreign affairs in the Ribot cabinet headed by Brisson. He retained this office under the subsequent premiership of Dupuy, Waldeck-Rousseau, Combes and Rouvier, until June 6, 1905. In 1898, French diplomacy was roughly divided into two schools. Hanotaux, his predecessor at the Foreign Office, had been striving in an uncertain way to bring about some sort of co-operation between France, Russia and Germany, and he had rather allowed the Franco-Russian alliance to evolve in an anti-British direction. On the other hand, the French ambassadors in Rome and Constantinople, Barrère and Paul Cambon, always insisted that the Franco-Russian alliance should be made compatible with a Franco-British rapprochement, it being absurd for a colonial power like France deliberately to cross the purposes of the supreme maritime power. The foreign office officials were amazed when they saw that the new comers, apparently without any previous experience of practical diplomacy, resolutely cast in his lot with Barrère and Cambon (the latter was appointed to the London Embassy in Dec. 1898) and unhesitatingly acted from the outset on the principle that the only nation France need be afraid of and guard against was Germany, and that, therefore, alliance must be sought with Britain as well as with Russia and that the way must be paved (incredibly paradoxical as it seemed them) for a Russo-British understanding.

As a matter of fact Delcassé had inherited these views from the Gambetta school of thought through Camille Barrère. As early as the autumn of 1898—the grand duke Vladimir happening to be in Paris—Delcassé is reported to have expounded the above policy to his advisers, protesting to them that the grand duke, who was still thinking and speaking in the terms of the Hanoïan period, had misunderstood him. In 1903, when Delcassé came back from London, where he had prepared the Franco-British treaty of April 8, 1904, he told his officials the conversation he had had with Lord Lansdowne and Joseph Chamberlain, and told them that Chamberlain had incited him to bring about a rapprochement between England and Russia. "When I heard this," he said, "I felt my brain turning. I replied to Mr. Chamberlain: 'I shall refrain from making any direct approach to Russia because I should be denounced in Petersburg as having sold her in London. But I promise you I shall take every opportunity of praising the new Entente Cordiale and of inspiring our Russian ally with a desire for some sort of treaty with Great Britain.'" These details are worth stating because they may enable the historian to apply to Delcassé what Cardinal de Retz said about Richelieu: "*Il eut l'intention des choses qu'il fit*."

At the back of Delcassé's political conceptions was a very deep feeling of France's greatness and an unshakable confidence in her destiny. Not that he ever planned war. But he was of opinion (he stated it clearly at the time of the Russo-German intrigue of 1904-1905, which aimed at compelling France, under the threat of an invasion through Belgium, to enter a coalition of Germany and Russia) that if the friendship of England was not secured by French diplomacy, Berlin and London would sooner or later get together, the Triple Alliance be rendered still more formidable, and France pay the cost of that combination on the Continent and in her overseas territories. Only second in importance in Delcassé's mind, to this persistent idea of the Anglo-French-Russian Triple Entente, was the belief that his country's fate was bound up with the consolidation and extension of its North African empire. In his judgment no great nation could exist without a minimum of material power and territorial weight. France could only find that minimum by making use of her North African opportunities.

Delcassé's scheme was carried out in the seven years extending to 1905, under difficulties which seemed well nigh insuperable. In succession, he was confronted by the incident of Fashoda, the South African war, which rekindled anti-British feeling in France, the Dreyfus affair, bringing in its train the distinct weakening of

the French army, and the Russo Japanese war of 1904. The Minister bravely stood his ground. The recall of Captain Marchand from the Nile was announced on Nov. 4, 1898, and the Franco British Convention of June 14, 1898, which Hanotaux had concluded before his resignation, for the delimitation of French and British interests in the region of the Niger, was completed by the fuller settlement of March 21, 1899. As regards the Far East, M. Delcassé unceasingly sought to support in Petersburg the peaceful policy of Count Lamsdorf as against the faction Alexeev-Bezobrazov and, in Oct. 1904, when the Dogger Bank incident occurred, he was fortunate enough to mediate between London and Petersburg. As to the Dreyfus affair, he consistently observed an attitude of reserve and detachment. As a member of the Waldeck-Rousseau and Combes cabinets, he formally proved the whole anti clerical policy, and did nothing openly to check the action of the War Minister, General Andre. He shut himself up in his study at the Quai d'Orsay, enjoying the hearty support of the president of the republic, Loubet, and turning a blind eye to home politics in his passionate attachment to his work. But the time was approaching when he would have to come forward and fight for what he had done. Things changed for him with the advent to power of Rouvier in Jan. 1905.

On April 8, 1904, had been signed the Convention about Morocco and Egypt, the starting point of the Entente Cordiale, the great achievement of Delcassé, Paul Cambon and Lord Lansdowne, not to speak of Edward VII. who consistently favoured it. In Berlin, the Franco-British rapprochement had to the last moment been deemed unthinkable. After some hesitation it was challenged by the Kaiser himself in his famous speech at Karlsruhe on April 27, 1904, and, on March 31, 1905 William II. paid a visit to the representative of the Sultan of Morocco in Tangier, proclaiming that he would stand by the independence of the Sherifian empire. German diplomacy acted throughout on the theory that French parliamentary opinion would not stick to the Entente Cordiale as soon as it understood that it might mean instant war with Germany. To a certain point the calculation proved true enough. Rouvier, a practical financier, who was inclined to believe that the German danger could be disposed of by means of economic co-operation between France and Germany, and that the French army was not fit to withstand the onslaught of the German Army, led the battle against his own foreign minister with the assistance of nearly the whole cabinet. In the sitting of the Chamber of April 18, Delcassé was criticized from nearly every side, and though formally supported by the premier, tendered his resignation, which, however, the president of the republic persuaded him to withdraw. But the position of Delcassé quickly became untenable. Germany was pressing for the summoning of an international conference on Morocco, and Rouvier was exchanging views with von Bulow behind the back of his colleague. Towards the end of May, the German Government was in that way acquainted with the British proposal for a military alliance in case war should ensue from the 1904 treaty, a step that immediately led von Bulow to let it be known in Paris, through Tittoni, that any advance of France towards Fez would bring about a declaration of war. Rouvier openly pressed Paul Cambon to discontinue the negotiation for the treaty of alliance with England. Vehement explanations were exchanged in the ministerial council held on June 6, 1905, which culminated in the final resignation of Delcassé.

There is no doubt that technical faults could be put to the debit side of Delcassé's account. He did not take sufficient care to communicate officially to Germany in advance the bargain he was going to make with the British Foreign Office. The information he had given to Prince Radolin on March 13, 1904, can perhaps hardly be regarded retrospectively as fully supplying the missing link in the chain of necessary diplomatic preparation. In April 1905, he evinced some vacillation, and tried to initiate a belated conversation with the German ambassador. At times, his character was not perhaps as resolute as his policy. During his whole career he was prone to make mistakes, which it is even to-day all the more difficult to explain as he usually surrounded himself with complete secrecy, confided in no one, and took care

that his steps should not be easily traced. In 1902, he had been about to sign with Spain, to the amazement of his own officials, a treaty which included Fez in the Spanish zone and did not even provide for the passage of troops between Algeria and the French zone in Morocco, an accident which accounts for the hostility shown to him by Etienne, deputy for Oran and war secretary under Rouvier. However, when he left the Quai d'Orsay, the position of France in Europe had changed beyond recognition. The Triple Entente was virtually in existence, and even the foundation of the Anglo-Russian treaty of January 31, 1907, had been laid. The clauses of the Triple Alliance treaties specially directed against France since 1887 had been suppressed as a result of the Franco-Italian convention of 1902 on Tunis and Tripoli, secured by Barrère. Spain had rallied to the Franco-British treaty of April 1904 in October of the same year. On the whole, the system had withstood the test of the most trying developments. As Paul Cambon remarked in a letter of May 1905, the British alliance was perhaps in advance of what French public opinion was ready to stand at the time, and it was not well that it should be possible to denounce it as the work of one man. But what was done in 1898-1905 might perhaps not have been done later.

Having fallen from office, Delcassé remained completely silent for nearly three years but, meanwhile, he was very active in the lobbies. On Jan. 24, 1908, taking the opportunity offered by a debate on Morocco, he suddenly launched a carefully prepared speech which amounted to a vindication of his policy. He was acclaimed by the assembly. On July 20, 1909, as chairman of the marine commission, he engaged in an oratorical duel with Clemenceau, who was clumsy enough to allude to the events of 1905, the Clemenceau cabinet had to resign on the same night. The vacant premiership was not, however, offered to Delcassé, lest the Central Powers should interpret the move as a provocation. He was given the Ministry of Marine in the spring of 1911, and kept it for two years under Monis, Caillaux and Poincaré. He certainly thought of contesting the presidency of the republic in January 1913, but his calculation that his name would be put forward at the second ballot once the other candidates, Poincaré and Pams, had spent their strength, came to nothing. He voted openly for the Radical Socialist, Pams. Notwithstanding the distant and unfriendly relations obtaining between the two men, Poincaré, as president of the republic, endeavoured to induce Delcassé to accept either the premiership or the ministry of foreign affairs. He refused, but, a few days afterwards, was persuaded by Briand and Jonnart (respectively president of the council and foreign secretary) to take charge for several years of the St. Petersburg embassy, which had fared very badly under Georges Louis, to the detriment of the Franco-Russian Alliance.

Germany was quickly increasing her armaments, and the whole machinery of the Franco-Russian alliance sadly needed mending and overhauling, it was felt that Delcassé alone would enjoy the moral authority requisite to perform the task. The hope expressed in him was fully fulfilled. With the emperor Nicolas and with Sazonov his credit was unbounded. Yet, he did not make the least attempt to live as an ambassador. His way of living was parsimonious. He stuck to the habits of a little French bourgeois, taking a stroll on the quay at 8 o'clock in the morning. As far as current affairs were concerned, he always favoured a concert of Europe, and urged moderation on Russia in the controversies over Silistria and Scutari. In December 1913, he expressed himself very pessimistically about the consequences of the Liman von Sanders mission in Constantinople. Two months before, he had asked for his recall. No satisfactory explanation of that sudden decision is available. He had not seen eyes to eyes with the Paris Government over the French claims to Syria and the pourparlers with Germany for the building of French railways in Armenia, as he was steadily opposed to the extension of French commitments in the Near East, which he believed dangerous and likely to resuscitate former Franco-British dissensions. But, in 1913, such matters did not loom very large on the horizon.

The word "failure" must unfortunately be written across Delcassé's last tenure of office. In June 1914, after the general election had resulted in the constitution of a radical majority, the

premiership was again pressed upon him in vain by Poincaré. He only agreed to take the War Office in the short lived Ribot cabinet. The temper of the country was very far removed then from the impending European developments. In the midst of the invasion of France by the German army, when Viviani had to transform his ministry into a ministry of national defense, Delcassé, who was hailed by the country as the embodiment of the Russian and British alliances came back, on Aug. 27, to the Quai d'Orsay and remained there until Oct. 13, 1915, when he resigned in order to protest against the Salonika expedition. As far as the winning of Italy to the side of the Allies was concerned, he did all that could be expected of him, and, in April 1915, approved the Treaty of London with the Government of Rome. But, in the Balkans, from beginning to end, he persistently followed the wrong track, and his closest advisers were at loss to understand his conduct, which bore such a striking contrast with his former clearness of judgment and power of vision. He allowed himself to be deceived by Bulgaria, held in check the Serbian army which, left to itself, would have interfered with the mobilization of King Ferdinand's army, allowed Venizelos to be dismissed by King Constantine and, having approved of the Gallipoli campaign some nine months before, set his face against any assistance being lent to Serbia. Moreover, for unknown reasons, he delayed for fully six months the assent of the French Government to the annexation of Constantinople by Russia as a feature of the eventual peace treaties. On Sept. 16, 1916, in the secret sitting of the Chamber, he harped, for his defense, on the theme that he only wished 500,000 Germans were already encamped in Salonika, since the strength of the Kaiser's army on the western front, where the issue would be settled, could not fail to be all the more impaired. A passionate reply from Bland, then president of the council, crushed him, and he retired into private life and complete solitude. He entirely disapproved of the policy followed by the French and British cabinets in 1918 and 1919. The British Alliance and the building up of the Rhineland as a bulwark against Germany remained his motto to the end. Hardly any one ever saw him (till his sudden death from arteriosclerosis, on Feb. 21, 1923). He had been very much affected by the death of his son, Jacques, who had been seriously wounded and transferred to Switzerland. His daughter, Suzanne, married General Nogues.

He is reported to have destroyed most of his personal papers. In spite of his limitations, he remains, by general consent, the outstanding figure of the Third republic in the field of foreign affairs.

(A. GÉ.)

DEL CREDERE. A "del credere agent," in common law, is one who, in consideration of additional remuneration called a del credere commission, undertakes that persons with whom he con-

elementary souls of primitive human beings. Her four masterpieces are *Elas Portolu* (1903), the story of a mystical convict in love with his brother's bride, whom he refuses to marry when she becomes a widow, deciding to consecrate himself to the priesthood, *Cenere* (*Ashes*, 1904), in which an illegitimate son causes the suicide of his mother, *L'Edera* (*The Ivy*, 1908), the story of a servant who kills to save her master from financial ruin, and later finds in her marriage with him only expiation for her sin, *La Madre* (*The Mother*, 1920), the tragedy of a mother who realizes her dream to make a priest of her son only to see him yielding to the temptations of the flesh.

The themes of her other novels are similar, such as *La Vsa di Male* (*The Road to Evil*, 1906), *Colombi e Sparvieri* (*Doves and Hawks*, 1915), *Canne al Vento* (*Reeds in the Wind*, 1913), *L'Incendio nell'Oliveto* (*The Fire in the Olive Orchard*, 1918), *Marianna Sirca* (1915), *Annalena Balsini* (1927), *Cosma*, published posthumously, in 1937, in which the author describes herself and the life of her early youth.

Grazia Deledda was in interpreter of Sardinian life, the poet of the island which was for her a source of love and experience, of imagination and creation. Her concept of Sardinian psychology was not unlike Giovanni Verga's, and in this sense, after Verga, she is considered by some the greatest representative of *verismo*, the Italian offshoot of French naturalism, which, however, expressed itself not in sociological and scientific theories, but in an evocation of regional life. But the most important characteristic of her work, which includes some 50 volumes, is its lack of literary culture, intellectual construction and stylistic ambitions—an exception in Italian letters, traditionally learned, conscious and sophisticated.

DELESCLUZE, LOUIS CHARLES (1809-1871), member of the Pans commune, was born at Dreux (Eure et Loir) on Oct. 2, 1809. Under Louis Philippe he adopted extreme republican views, fought in the insurrection of June 1832 and in 1836 was forced to leave France. In 1840 he returned, settled at Valenciennes, and took up republican journalism. On the success of the revolution of 1848 he was appointed prefect of the Nord and Pas-de-Calais departments. He was afterward the only communist leader with administrative experience. He resigned his post on the meeting of the national assembly, went to Paris and combated the growing conservatism of the government by means of his journal *La Révolution Démocratique et Sociale*, and by a society called *Republican Solidarity* intended to defend the republic in the provinces. On the failure of the radical *émeute* in June 1849 he was forced to fly to England. He returned in 1853, was betrayed by a spy and taken to a convict plantation in French Guiana. In 1859 he returned to France, broken in health, and resumed journalism. He was personally hostile to Louis Auguste Blanqui (*q.v.*), but in reality his policy was impregnated with Blanqui's ideas, he was commonly classified neither as a socialist nor as an internationalist, but as a "jacobin." After a further imprisonment he fled to Belgium in 1870, returning on the fall of the empire. He was elected a member of the national assembly and also of the Paris commune in 1871; he chose to sit in the latter, and his seniority, ability and high character gave him the most authoritative position. His energies were not, indeed, equal to producing order in the chaotic administration of the commune (see *COMMUNE*) in two months, but he was its most capable and disinterested leader. On May 9 he took over the department of war, but it was too late for reorganization. The government troops broke in on May 22, and the communist forces separated into their local sections. Delescluze for the next three days attempted to combine and organize the defense, himself fighting with reckless courage, but on May 25, perceiving that defeat was certain, he dressed himself in civilian clothes, with the broad red sash of a member of the commune, and climbed, unarmed, a barricade at the Chateau d'Eau which was under heavy fire. When he reached the crest and his insignia could be seen by the government troops, he was immediately, as he had hoped, killed.

See his *De Paris à Cayenne, journal d'un transporté* (Eng. trans. 1872), P. Larousse, *Dictionnaire du XIX^e siècle* (1870) s.v. "Delescluze", and the books cited under *COMMUNE*. (R. W. F.)

ians (see *AMPHICTYONY*). In this synod the allies met under the presidency of Athens. Thucydides (1.97) lays emphasis on the fact that in these meetings Athens, as head of the league, had no more than presidential authority, and the other members were called *συνμαχοί* (allies). Athens appointed a board called the *Hellenotamiai* (*ραῖται*, steward) to administer the treasury of the league, which was kept at Delos, and to receive the contributions (*φóροι*) of the allies who paid in money.

The league was therefore a free confederation of autonomous Ionian cities founded with the object of protecting themselves by means of a "counter offensive" (Thuc. 1.96) against the common danger from Persia, and led by Athens in virtue of her predominant naval power. It is a mistake to regard the league during the first 20 years of its existence as an Athenian empire. Thucydides (*loc. cit.*) expressly describes the predominance of Athens as *ἡγεμονία* (leadership, headship), not as *ἐμπύλη* (empire), and the attempts made by Athenian orators during the second period of the Peloponnesian war to prove that the attitude of Athens had not altered since the time of Aristides are manifestly unsuccessful.

The first ten years of the league's history was a period of steady, successful activity against the few remaining Persian strongholds (see *ATHENS*, *CIKON*). In these years the Athenian sailors reached a high pitch of training, while certain of the allies became weary of incessant warfare. Athens supported by the synod (*συνόδος*) of the *Hellenotamiai*, enforced the contributions of ships and money according to the assessment. Gradually the allies began to weary of personal service, and persuaded the synod to accept a money commutation. The Ionians were averse to prolonged warfare, and in the prosperity which followed the rout of the Persians a money contribution was held a trifling burden. The result was, however, bad for the allies, whose status in the league became lower in relation to that of Athens, while at the same time their naval resources diminished. Athens became more powerful, and could afford to disregard the authority of the synod. Another new feature appeared in the coercion of cities which desired to secede. The protection of the Aegean would become impossible if some of the islands were liable to be used as piratical strongholds, and it was only right that all should contribute in some way to the security which all enjoyed. In the cases of Naxos and Thasos, the league's resources were employed, not against the Persians, but against recalcitrant Greek islands. Shortly after the capture of Naxos (c. 467 B.C.) Cimon proceeded with a fleet of 300 ships (only 100 from the allies), to the south-western and southern coasts of Asia Minor, and routed the Persians on land and sea at the mouth of the Euxine, in Pamphylia. This engagement was the final episode of the struggle between the Greeks and Persia. The very completeness of the victory raised the question of the continuance of the league now that the danger which had given rise to it was effectively removed. It remained to be seen whether Athens would permit secession, which she was theoretically unable to prevent. If she did not, her "leadership" would definitely be converted into an empire. The event proved that Athens had no intention of allowing the dissolution of a body which had brought her such an advance in power. The capture of Thasos (463 B.C.), due to trade rivalry on the Strymon, was a first indication of what the "allies" might expect. About the same time Cimon (q.v.), whose philo-Spartan policy was displeasing to the leaders of the new democracy, was successfully overthrown by Ephialtes and Pericles. After his fall the resources of the league were increasingly used in the prosecution of Athens' imperial designs. Between this time and the peace of Calias (449 B.C.) which put an end to the war with Persia (see *CIKON*) all the allies had commuted their naval service for a money payment, with the exception of Chios, Lesbos and Samos. In 454 B.C. the domination of Athens was crystallized by the transference of the federal treasury from Delos to Athens. In the meantime Athens was busy transforming her sea empire into a land and sea empire. By 448 B.C. she dominated not only her former "allies," but also Megara, Boeotia, Phocis, Locris, Achaia and Troezen. The conception of a league of independent allies was still further violated in 451 B.C. by Pericles'

law under which citizenship, with all its advantages, such as the right to sit on paid juries, was restricted to those who could prove themselves the children of an Athenian father and mother. Thus the "allies" saw themselves still further excluded from recognition (see *PERICLES*). The resulting antipathy to Athens, and the centrifugal spirit natural to the Greek in politics, combined for the disruption of a tyranny which had become odious to all alike. The first to secede were the land powers, where the democracies established by Athens as a guarantee of her predominance were overthrown by oligarchies. The reverse of Coronea (446 B.C.) was followed by the loss of Boeotia, and shortly afterwards by that of Phocis, Locris and Megara. By the "Thirty Years Peace" (445 B.C.) Athens abandoned Nisaea, Pegae, Troezen and Achaia. Her newly acquired land empire was irretrievably lost.

The maritime allies were not slow in attempting to follow the example of Boeotia and the land powers. The next important event is the revolt of Samos (440 B.C.), which had quarrelled with Miletus and refused the arbitration of Athens. The island was conquered with great difficulty by the whole force of the league. It is noticeable that the main body of the allies was not affected, and that the Peloponnesian league, on the advice of Corinth, recognized the right of Athens to deal with her rebellious subject allies, and refused to help the Samians.

The events which led to the Peloponnesian war are discussed in other articles (see *ATHENS*, *HISTORY*, and *PELOPONNESIAN WAR*). Two alone call for special notice. The first is the raising of the allies' tribute in 425 B.C. by a certain Thudippus. The second event belongs to 411, after the failure of the Sicilian expedition. In that year the tribute of the allies was commuted for a 5% tax on all imports and exports by sea.

The Tribute—Thucydides is almost certainly wrong in saying (1.96) that the amount of the original tribute was 460 talents (about £106,000), this figure cannot have been reached for at least 12 years, when new members had been enrolled (Lycia, Caria, Eion, Lampasus). He is probably wrong, when he says that it amounted to 600 talents at the beginning of the Peloponnesian war. The moderation of the assessment is shown not only by the fact that it was paid so long without objection, but also by the individual items. Even in 425 Naxos and Andios paid only 15 talents, while Athens had just raised an *eisphora* (income tax) from her own citizens of 200 talents.

The number of tributaries some authorities give as 200, others put it as high as 290. In some cases several towns were grouped together in one payment (*συμμετέλει*). These were grouped into geographical divisions, each division represented by two elective commissioners (*τακταί*), who assisted the Boule at Athens in the quadrennial division of the tribute. Each city sent in its own assessment before the commissioners who presented it to the Boule. If there was any difference of opinion the matter was referred to the ecclesia for settlement. In the ecclesia a private citizen might propose another assessment, or the case might be referred to the law courts.

Government and Jurisdiction—There is much difference of opinion regarding the attitude of imperial Athens towards her allies. Grote maintained that on the whole the allies had little ground for complaint, but he seems to leave out of account the Greeks' dislike of external discipline. The fact that the hegemony had become an empire was enough to make the new system offensive to the allies. No strong argument can be based on the paucity of revolts. The indolent Ionians had seen the result of secession, the Athenian fleet was perpetually on guard in the Aegean. Among the mainland cities revolt was frequent, Athenian domination may have been salutary in its effects, but the allies did not regard it with affection.

In the later period of the first league's history the Athenians interfered with the local autonomy of the allies. Though it appears that Athens made individual agreements with various states, and therefore that we cannot regard as general rules the terms laid down in those which we possess, it is undeniable that the Athenians planted garrisons under Athenian officers (*δορυπαροχοί*) in some cities. All important cases between Athenians and citizens of allied cities were tried before the Athenian courts. Athens im-

posed democratic constitutions on her allies, indeed Isocrates takes credit for Athens on this ground. Though Chios, Lesbos and Samos retained their oligarchic governments, and Selymbria was permitted to choose its own constitution, it is clear that Athens did exercise over many of her allies an authority which extended to local administration. Thus the leadership of Athens in a harmonious league of free Greek states became an empire which proved intolerable to the autonomous states. Her failure was due partly to the commercial jealousy of Corinth working on the dull antipathy of Sparta, partly to the hatred of compromise and discipline characteristic of Greece, and partly also to the lack of tact and restraint shown by Athens and her representatives.

The Second League—The conditions which led to the second Delian Confederacy were fundamentally different, because the enemy was no longer an oriental power, but Sparta, whose ambitious projects since the fall of Athens had shown that there could be no safety for the smaller states save in combination.

As soon as the Athenians began to recover from the victory of Iysander and the government of the Thirty, their thoughts turned to the possibility of recovering their lost empire. The first step in this direction was the recovery of their sea power, which was effected by the victory of Conon at Cnidus (Aug. 394 B.C.). Cities which had formed part of the Athenian empire returned to their alliance with Athens, until Sparta had only Sestos and Abydos of all that she had won by the battle of Aegospotami. No systematic constructive attempt at a renewal of empire was made. Athenian relations were with individual states only, and the terms of alliance were various. The whole position was changed by the successes of Thrasylbulus, who set up a democracy in Byzantium and reimposed the old 10% duty on goods from the Black Sea. Many of the island towns subsequently came over, and from inscriptions at Clazomenae and Thasos we learn that Thrasylbulus was deliberately aiming at a renewal of the empire, though he had no general backing in Athens.

The peace of Antalcidas (see ANTALCIDAS) in 387 B.C. was a blow to Athens. Antalcidas compelled the Athenians to give their assent to it by making himself master of the Hellespont by stratagem. By this peace all the Greek cities on the mainland of Asia with the islands of Cyprus and Clazomenae were recognized as Persian, all other cities except Imbros, Lemnos and Scyros as autonomous. Directly, this arrangement prevented an Athenian empire, indirectly, it caused the sacrificed cities and their kinsmen on the islands to look upon Athens as their protector. The selfishness of the Spartans was emphasized by their capture of the Athenian citadel, and by the raid upon Attica in time of peace by Sphodrias, and his immunity from punishment at Sparta. The Athenians at once invited their allies to a conference, and the Second Athenian Confederacy was formed. Those represented at it were Athens, Chios, Mytilene, Methymna, Rhodes, Byzantium and Thebes, which joined Athens soon after the Sphodrias raid. In the spring of 377 invitations were sent out to the maritime cities. Some time in that year Tenedos, Chios, Chalis, and Euboea, and Eretria, Crystus and Arcthesia were in their alliance, followed by Perinthus, Paphlagonia, Sualthus, and other maritime cities.

Sparta was roused to a sense of the significance of the new confederacy, and the Athenian corn supply was threatened by a Spartan fleet of 20 triremes. The Athenians fitted out a fleet under Charinus, who gained a victory over the Spartans between Naros and Paros (battle of Naros 375 B.C.), both of which were added to the league. Proceeding northwards in 375 Charinus brought over a large number of the Thracian towns including Abdera, Rhosus and Samothrace. The successes of Imotheus in the west resulted in the addition to the league of Corcyra and the cities of Cephalonia. Sparta sent out a fleet, but Imotheus, in spite of general embarrassment held his ground. By this time, however, the alliance between Thebes and Athens was growing weaker and Athens, being short of money, concluded a peace with Sparta. Trouble, however, soon arose at Zancle, and the Spartans not only sent help to the Zanclean oligarchs but even besieged Corcyra (373). Imotheus was sent to relieve

the island, but shortness of money compelled him to search for new allies. This delay in sending help to Corcyra was condemned by the Athenians, who dismissed Imotheus in favour of Iphicrates. An expedition followed, but the absence of any positive success, the pressure of financial difficulty, and the high handed action of Thebes in destroying Phlaea (373), induced Athens to renew the peace with Sparta. An agreement was made by a congress at Sparta on the basis of the autonomy of the cities. The Thebans at first accepted the terms, but, realizing that they were being balked of their pan-Bœotian ambition, severed themselves from the league.

The peace of 371 B.C. may be regarded as the conclusion of the first period in the league's existence. The original purpose of the league—the protection of the allies from the ambitions of Sparta—was achieved. Athens was recognized as mistress of the sea, Sparta as the chief land power. The weakness of the coalition had, however, become apparent. The enthusiasm of the allies waned rapidly before the financial exigencies of successive campaigns, and it is clear that Thebes had no interest save the extension of her power in Bœotia. There were not wanting signs that the league was not destined to remain a power in the land.

The remaining history may be broken up into two periods, the first from 371 to 357, the second from 357 to 338 B.C. Throughout these two periods, which saw the decline and dissolution of the alliance, examples of corporate action are few.

Period 371–357 B.C.—The first event in this period was the battle of Leuctra (July 371), in which, no doubt to the surprise of Athens, Thebes temporarily asserted itself as the chief land power in Greece. To counterbalance the new power Athens tried to induce the states which recognized the hegemony of Sparta to transfer their allegiance to the Delian league. It seems that the states adopted this policy with the exception of Elis. The policy of Athens was mistaken for two reasons: (1) Sparta was not entirely humiliated, and (2) alliance with the land powers of Peloponnese involved Athens in enterprises which could not awaken the enthusiasm of her maritime allies. This new coalition alarmed Sparta, which at once made overtures to Athens on the ground of their common danger from Thebes. The alliance was concluded in 369 B.C. About the same time Iphicrates was sent to take possession of Amphipolis according to the treaty of 371. Some success in Macedonia roused the hostility of Thebes, and the subsequent attempts on Amphipolis caused the Chalcidians to declare against the league. The old suspicion of the allies was now awakened, and we find Athens making great efforts to conciliate Mytilene by honorific decrees. This suspicion, due primarily, no doubt, to the agreement with Sparta, was strengthened by the exchange of compliments with Dionysius I. of Syracuse, who received the Athenian citizenship, and by the Athenian alliance with Alexander of Phœæ (368–367). The maritime allies had no desire to be involved in the quarrels of Sicily, Thessaly and the Peloponnese.

In 366 Athens lost Oropus, a blow which she endeavoured to repair by forming an alliance with Arcadia and by an attack on Corinth. Imotheus was sent in 366–365 to make a demonstration against Thebes, bringing Symos in the hands of Cyprothemis, a servant of the city figures, he captured it after a month's siege, and established a cleruchy.

The next important event was the attempt on the part of Epaminondas to challenge Athenian naval supremacy. Though Imotheus held his ground the confederacy was undoubtedly weakened. In 362 B.C. Athens joined in the opposition to the Theban expedition which ended in the battle of Mantinea. In the next year the Athenian generals failed in the north in their attempt to control the Hellespont. In Thessaly Alexander of Phœæ became hostile and after several successes even attacked the Peloponnese. Thebes was ordered to make reprisals, but instead sailed to Corcyra where he made the mistake of siding with the oligarchs. The league was not so successful in the recovery of Imotheus (357) as it was once more added to the league.

During these 12 years the policy of Athens towards her maritime allies was short-sighted and inconsistent. Alliances with land powers and an inability to understand the true relations

which alone could unite the league, combined to alienate the allies, who could discover no reason for the expenditure of their contributions on protecting Sparta or Corinth against Thebes. There was ground for suspecting disloyalty in many quarters. On the other hand, though the Athenian fleet became stronger and several cities were captured, the league itself did not gain any important adherents.

Period 357-338 B.C.—Chios, Rhodes, Cos, Byzantium, Erythraea and other cities were in revolt by the spring of 356 B.C., and their attacks on loyal members of the confederacy compelled Athens to take the offensive. Chabrias had been killed in an attack on Chios, and the fleet was under the command of Timotheus, Iphicrates and Chares, who sailed against Byzantium. The enemy sailed north from Sinope, and in a battle off Embot (between Erythraea and Chios) defeated Chares, who, without the consent of his colleagues, had ventured to engage them in a storm. Chares sought to replenish his resources by aiding the Phrygian satrap Artabazus against Artaxerxes Ochus, but a threat from the Persian court caused the Athenians to recall him, and peace was made by which Athens recognized the independence of the revolted towns. The league was further weakened by the secession of Corcyra, and by 355 B.C. was reduced to Athens, Euboea and a few islands. By this time, moreover, Philip II of Macedonia had begun his career of conquest. In 355 his advance temporarily ceased, but the financial exhaustion of the league was such that its destruction was only a matter of time. Resuming operations in 354, Philip, in spite of temporary checks at the hands of Chares, took from the league all its Thracian and Macedonian cities. In 352-351 Philip actually received help from former members of the confederacy. In 351 Chandermus, Chares and Phocion were sent to oppose him, but no successes were gained. In 346 the peace of Philocrates was made between the league and Philip on terms which were accepted by the Athenian Boule. It is very remarkable that, in spite of the powerlessness of the confederacy, the last recorded event in its history is the steady loyalty of Tenedos, which gave money to Athens about 340 B.C. The victory of Philip at Chaeroneia in 338 finally destroyed the league.

In spite of the precautions taken by the allies, the policy of the league was, almost throughout, directed in the interests of Athens. Founded with the object of thwarting the ambitious designs of Sparta, it was plunged by Athens into enterprises which exhausted the resources of the allies without benefiting them in any respect. There is no doubt that the cities were held to their allegiance solely by the superior force of the Athenian navy.

For the last years of the league see also PELOPONNESIAN WAR. For inscriptions, see E. L. Hicks and G. F. Hill, *Greek Historical Inscriptions* (Oxford, 1907), G. F. Hill, *Sources of Greek History*, 478-431, 2nd ed. (1907).

The Second League.—The chief modern works are G. Busolt, "Der zweite athenische Bund" in *Neue Jahrbücher für klassische Philologie*, supp. vol. viii, pp. 645-866 (1877-78), and F. H. Marshall, *The Second Athenian Confederacy* (1905), one of the Cambridge Historical Essays (no. xii). The latter is based on Busolt's monograph and includes subsequent epigraphic evidence, with a full list of authorities. The meagre data given by ancient writers are collected by Busolt and Marshall.

DELIBES, CLÉMENT PHILIBERT LÉO (1836-1897), French composer, was born at Saint Germain du Val on Feb. 21, 1836. He studied at the Paris Conservatoire, and became accompanist at the Théâtre Lyrique. His first essay in dramatic composition was his *Deux sous de charbon* (1853), and during several years he produced a number of operettas. His cantata *Alger* was heard at the Paris opera in 1865. Having become second chorus master of the Grand Opéra, he wrote the music of a ballet entitled *La Source* (1866) for this theatre, in collaboration

with Minkowski, a Polish composer. The composer returned to the operetta style with *Malibrouche s'en va t'en guerre*, written in collaboration with Georges Bizet, Emile Jonas and Legoux, and given at the Théâtre de l'Athénée in 1867. Two years later came *L'Écossais du Chatou*, a one-act piece, and *La Cour du roi Pétard*, a three act opera bouffe. The ballet *Coppélia* was produced at the Grand Opéra on May 25, 1870, with enormous success.

Delibes gave up his post as second chorus master at the Grand Opéra in 1872 when he married the daughter of Mademoiselle Denain, formerly an actress at the Comédie Française. His first important dramatic work was *Le Roi Pa dit*, a charming comic opera, produced on May 24, 1873 at the Opéra Comique. Three years later, on June 14, 1876, *Sylvia*, a ballet in three acts, one of the composer's most delightful works was produced at the Grand Opéra. This was followed by *La Mort d'Orphée*, a grand scena (Trocadero concerts in 1878), *Jean de Nivelle* (Opéra Comique, March 8, 1880), and by *Lakmé* (Opéra Comique, April 14, 1883). *Lakmé* has remained his most popular opera. The composer died in Paris on June 16, 1891, leaving *Kavaya*, a four act opera, in an unfinished state. In 1881 Delibes became a professor of advanced composition at the Conservatoire, and in 1884 he took the place of Victor Masse at the Institut de France.

See E. Guiraud, *Delibes* (1892).

DELILAH, in the Bible, the heroic of Samson's last love story (Judges xvi). She was a Philistine of Sorek (mod. Sürük), west of Zorah, who, bribed by the "lords of the Philistines" to entrap him, coaxed him (after several failures) into telling her the secret of his strength, whereupon she took advantage of his confidence to incapacitate him and betray him to his enemies. (See SAMSON.)

DELILLE, JACQUES (1738-1813), French poet, was born at Aigue Perse in Auvergne. He was an illegitimate child, and was descended by his mother from the chancellor De l'Hôpital. He was educated at the college of Lisieux in Paris and became an elementary teacher. He gradually acquired a reputation as a poet by his epistles, in which things are not called by their ordinary names but are hinted at by elaborate periphrases. Sugar becomes *le miel américain que du suc des roseaux exprima l'Africain*. The publication (1769) of his translation of the *Georgics* of Virgil made him famous. Voltaire recommended the poet for the next vacant place in the academy, but his admission was deferred until 1774 on the ground of his youth. He showed a real love of nature, of an 18th century cultivated landscape, in his other poems, *Jardins* (1782), *L'Homme des champs* (1800), *Les trois règnes de la nature*, 2 vol. (1808).

Delille had become professor of Latin poetry at the Collège de France, and abbot of Saint Severin, when the outbreak of the revolution reduced him to poverty. He retired to St. Die, where he completed his translation of the *Aeneid*. He emigrated first to Basle and then to Glarus in Switzerland, and he passed some time in London, chiefly employed in translating *Paradise Lost*. In 1802 he was able to return to Paris, where, although nearly blind, he resumed his professorship and his chair at the academy, but lived in retirement.

His *Odes*, 16 vol., were published in 1824. See C. A. Sainte-Beuve, *Portraits littéraires*, vol. i.

DELIRIUM, the commonest of all psychoses, is characterized by incoherent thinking and confusion, ranging from mere bewilderment to complete insensibility, and by restlessness that at times may reach a pitch of maniacal excitement. Hallucinations, chiefly of the visual variety, are frequently present as well as shifting, unsystematized delusions. The predominant mood is that of fear, shading off to feelings of doubt or apprehension. Consequently, the delusions and other misinterpretations of the environment are often of a suspicious or defensive kind provoked by imagined threats of harm. The condition tends to become worse late in the day and at night.

All true deliriums result from disturbances of the chemical processes of the brain. Thus, delirium may occur as a complication of many different general disorders. It is most often seen in fevers (especially in children), in drug intoxications of many kinds, in states of circulatory failure or of extreme exhaustion, in chronic

debilitating diseases, following surgical operations, and in cases of severe head injury. Ordinarily, the mental symptoms run a brief and rapid course and have a favourable outcome. However, a more prolonged psychosis need arouse no great alarm. At times, especially in elderly persons, symptoms persist unchanged for months but with ultimate recovery. (See PSYCHOSIS.)

Treatment is essentially supportive and protective—support of nutrition, circulation, etc., and constant surveillance of the patient to protect him from the possible consequences of his excitement. Special sedative measures such as continuous baths or drugs may be necessary but should be used only under medical supervision. Because a strange or changing environment aggravates the symptoms, the surroundings should be kept as familiar, simple and neutral as possible.

Delirium tremens is a toxic psychosis associated frequently with chronic alcoholism. While it conforms to the features of delirium in general, delirium tremens has, to a certain extent, a peculiar symptomatic stamp of its own. After a preliminary period of uneasiness and irritability, the psychosis proper comes on abruptly. Often it is precipitated by an acute infection or an injury but the prevalent view that the symptoms are brought on by enforced abstinence from alcohol is probably erroneous. The hallucinations, which are almost exclusively visual and tactile, are extraordinarily vivid and animated. Small animals or insects, in great numbers and in motion, are a common subject of hallucination as are strings and wires and other filamentous objects. The patients continuously busy themselves, sometimes by responding in terror to the hallucinated visions or by performing the actions of their habitual occupations. Of the physical symptoms, tremor is the most prominent. When present it is coarse and irregular and produces movements of all parts of the body including the lips and tongue. The duration of the acute attack is usually from four to six days.

Treatment does not differ from that of delirium in general. Because of the severe malnutrition that is almost invariably present, it is especially important that a diet of high caloric and vitamin content be supplied. Alcohol is probably never of value in treatment and may be harmful. (R B R.)

DELISLE, JOSEPH NICOLAS (1768–1768), French astronomer, was born in Paris on April 4, 1768. He proposed in 1715 the "Diffraction theory" of the sun's corona, visited England and was received into the Royal society in 1724, and left Paris for St. Petersburg on a summons from the empress Catherine toward the end of 1725. Having founded an observatory there, he returned to Paris in 1747, was appointed geographical astronomer to the naval department, and installed an observatory in the Hotel Clugny. Charles Messier and J. J. Lalande were among his pupils. He died of apoplexy at Paris on Sept. 12, 1768.

Delisle is chiefly remembered as the author of a method for observing the transits of Venus and Mercury by instants of contacts which was first proposed by him in a letter to J. Cassini in 1743.

In his *Mémoires pour servir à l'histoire et au progrès de l'Astronomie* (St. Petersburg, 1738), Delisle gave the first method for determining the heliocentric co-ordinates of sunspots.

DELISLE, LEOPOLD VICTOR (1826–1910), French bibliophile and historian, was born at Valognes (Manche). At the Ecole des Chartes, where his career was remarkably brilliant, his valedictory thesis was an *Essai sur les revenus publics en Normandie au XII^e siècle* (1849), and it was to the history of his native province that he devoted his early works. Of these the *l'Inde sur la co-dition de la classe agricole et l'état de l'agriculture en Normandie au moyen âge* (1851) condensing an enormous mass of facts drawn from the local archives was reprinted in 1905, without change, and remains authoritative. In Nov. 1853 he entered the manuscript department of the Bibliothèque Impériale (Nationale), or which, in 1874, he became the official head in succession to Jules Taschereau. Delisle was responsible for the catalogue of printed books in the library, and under his administration the library was enriched with numerous acquisitions, notably by the purchase of a part of the Ashmolean MSS. He was elected member of the Académie des Inscriptions et Belles-Lettres

in 1859, and became a member of the staff of the *Recueil des historiens de la France*, collaborating in vols. xxii (1865) and xxiii (1876) and editing vol. xiv (1904), which is valuable for the social history of France in the 13th century. After his retirement (Feb. 21, 1905) he prepared a catalogue and description of the printed books and MSS. in the Musée Condé, at Chantilly, left by the duc d'Aumale to the French Institute. Of his other works may be mentioned his *Mélanges de paléographie et bibliographie* (1880) with atlas, *Mémoire sur les actes d'Innocent III* (1857), and *Mémoire sur les opérations financières des Templiers* (1859), a collection of documents of the highest value for economic history. The 32nd volume of the *Histoire littéraire de la France*, which was partly his work, is of great importance for the study of 13th and 14th century Latin chronicles. Delisle was undoubtedly the most learned man in Europe with regard to the middle ages, and his knowledge of diplomatics, palaeography and printing was profound. His output of work, in catalogues, etc., was enormous, and his services to the Bibliothèque Nationale in this respect cannot be overestimated. His wife, a daughter of Eugene Burnouf, was for many years his collaborator.

The *Bibliographie des travaux de L. Delisle* (1902, supplement 1911), by Paul Lacombe, may be consulted for a full list of his numerous works.

DELITZSCH, FRANZ (1813–1890), German Lutheran theologian, Hebrew scholar and orientalist, was born at Leipzig on Feb. 23, 1813. He studied in the university of his native town, becoming in 1850 professor of theology at Erlangen, and in 1867 at Leipzig, where he died on March 4, 1890. Delitzsch was a strict Lutheran. With a view to the conversion of the Jews he edited the periodical *Saat auf Hoffnung* from 1863, revived the "Institutum Judaicum" in 1880, founded a Jewish missionary college, and translated the *New Testament* into Hebrew. He acquired such a mastery of post-biblical, rabbinic and talmudic literature that he has been called the "Christian Talmudist." Though never an advanced critic, his article on Daniel in Herzog's *Realencyklopädie* (2nd ed.), his *New Commentary on Genesis* and the fourth edition of his *Isaiah* show that his sympathy with higher criticism increased—so much so that Prof. Cheyne has included him among its founders.

He wrote valuable commentaries on *Habakkuk* (1843), *Genesis* (1852), *Neuer Kommentar über die Genesis* (1887), *Eng. trans.* (1888), *Psalms* (1869), *Eng. trans.* (1886), *Job* (1864), *Isaiah* (4th ed., 1889), *Eng. trans.* (1890), *Proverbs* (1873), *Epistle to the Hebrews* (1857), *Eng. trans.* (1865), *Song of Songs and Ecclesiastes* (4th ed. 1875). Other works are *Lutherthum u. Lugenthum* (1839), *Geschichte der jüd. Poesie* (1836), *Jesus und Hillel* (1867), *Handwerkerleben zur Zeit Jesu* (1868), *Eng. trans.* (1902), *Poesien aus vormuhamedanischer Zeit* (1874), *Iris, Farben studien und Blumenstücke* (1888), *Eng. trans.* (1889), *Messiasische Weissagungen in geschichtlicher Folge* (1890), and a popular devotional work *Das Sakrament des wahren Leibes und Blutes Jesu Christi* (1844).

DELITZSCH, FRIEDRICH, German orientalist, son of the preceding, born at Erlangen on Sept. 3, 1850, and educated at Leipzig, became professor of Semitic languages and Assyriology successively at Leipzig, Breslau and Berlin. His chief works are *Assyrische Lesestücke* (1876), *Wo lag das Paradies* (1881), *Assyrisches Wörterbuch zur gesamten bisher veröffentlichten Keilschriftliteratur* 3 pts. (1887–90), *Assyrische Grammatik* (1889), *Eng. trans.* (1890), *Geschichte Babyloniens u. Assyriens* (1897), *Babel u. Bibel* (1902), *Eng. trans.* (1903), *Grundzüge der sumerischen Grammatik* (1914), *Die Welt des Islam* (1915) and *Die grosse Täuschung Israels Eindringen in Kanaan* (1920). *Babel und Bibel*, two lectures delivered before the German emperor, caused a great controversy because it denied the verbal inspiration of the Old Testament and contended that it was largely inspired by Babylonian stories and that Semitic monotheism had gradually developed. While this attitude was not in itself new, the public letter of the emperor proclaiming the need of orthodoxy and of a realization of the distinction between reason and revelation brought the position of scholars before the public, and thereby aroused violent discussions.

DELITZSCH, town, in the Prussian province of Saxony, Germany, on the Lober, an affluent of the Mulde, 12 m N of Leipzig at the junction of the railways, Butterfeld-Leipzig and Hille Cottbus. Pop. (1939) 17,913. It has an old castle of the 12th century now a female penitentiary. Besides *Kulschwanz*, a peculiar kind of beer, it manufactures tobacco, cigars, chemicals, shoes and hosiery, and coal mining is carried on in the neighbourhood. Originally a settlement of the Sorbian Wends, and in the 12th century part of the possessions of the bishops of Merseburg, Delitzsch ultimately passed to the Saxe-Merseburg family, and on their extinction in 1738, was incorporated with Electoral Saxony but was finally transferred to Prussia in 1815.

DELIUM, BATTLE OF, 424 B.C. This battle, in the Peloponnesian War (q.v.) was the outcome of the Athenians' attempt to get control of Boeotia by a converging attack at three points, helped by expected uprisings of the democratic faction. But the Boeotians were forewarned and the risings forestalled. Nevertheless the main Athenian force was duly disembarked at Delium, on the coast, whither the Boeotians advanced to dislodge it. The significance of the subsequent battle is as a foreshadowing of the great era of Theban generalship under Epaminondas (q.v.), and of his method at Leuctra (q.v.). Room for deployment being restricted, the Theban commander, Pagondas, formed his right wing in exceptional depth—25 ranks, whereas the Athenians were the customary eight deep. When the two sides clashed, Pagondas's Boeotian left wing was driven in but the concentrated punch of his massive Theban phalanx on the right crushed their opponents. At this juncture Pagondas despatched his cavalry from the right wing, where it was unnecessary, to move round behind the hill from which he had advanced and to fall upon the Athenian right wing. This, disordered by its victorious encounter, was broken by the charge of Pagondas's cavalry, all the more effective because of the rarity of mounted shock tactics at that period. The defeated Athenian army was hotly pursued back to its landing place, and there embarked for home.

DELIUS, FREDERICK (1863–1934), British musical composer, was born at Bradford, Yorks, Jan. 29, 1863, the son of Julius Delius, a German, who, in 1860, became a naturalised British subject. He was educated at Bradford Grammar School and the International College, Islington, London. Declining the business career offered him in Bradford he went to Florida as an orange planter, but devoted his spare time to such musical study as he could obtain from the books in his possession. In 1886 he left Florida for Leipzig and there underwent a more or less regular training from Jadassohn and came under the influence of Grieg, then living in that town. His first published work, a *Légende* for violin solo with orchestral accompaniment, was issued in 1892, since when he has gained in ever-increasing measure, though very slowly, the recognition which is his due as one of the most considerable masters of his time. His music is as a whole however too delicate and restrained in character to be likely ever to secure wide general favour. Delius might be deemed indeed as a musician's musician and although general recognition has come to him so slowly, and even still in such limited measure, among the discerning few he has never lacked warm and whole-hearted appreciation. His not very extensive output comprises examples in most of the leading forms, including no fewer than six operas, *Irmelin*, *The Magic Fountain*, *Verano Musical*, *Le Dances*, *Four Seasons*, *Le Cadeau*, and *Le Vaisseau*.

He was educated at Bonn and Berlin, and in 1885 was appointed professor of Sanskrit, Provençal and English literature at Bonn, a post he held until his death. His greatest literary achievement was his scholarly edition of Shakespeare (1854–61). He also edited Wace's *St. Nicholas* (1850), a volume of Provençal songs (1853), and published a *Shakespeare Lexikon* (1852). As a critic of Shakespeare's text he stands in the first rank.

See the biographical notice by J. Schipper in *Englische Studien*, vol. 14 (1890).

DELLA BELLA, STEFANO (1610–1664), known in France as *Étienne de la Belle*, Italian engraver, was born at Florence. He was apprenticed to a goldsmith, but turned his attention to engraving, and studied the art under Santa Gallina. By the liberality of Lorenzo de' Medici he was enabled to spend three years in study at Rome. In 1642 he went to Paris, where Cardinal Richelieu engaged him to make drawings at Arras of the siege and taking of that town by the royal army. About 1650 he returned to Florence. His productions numbered over 1,400 separate pieces. His masterpiece is the view of the Pont Neuf in Paris.

DELLA CASA, GIOVANNI (1503–1556), Italian poet, was born at Mugello, in Tuscany. He studied at Bologna, Florence and Rome, and Pope Paul III. made him nuncio to Florence, where he was elected a member of the celebrated academy, and then to Naples. He was appointed to the archbishopric of Benevento, and it was believed that it was only his openly licentious poem, *Capitoli del forno*, and the fact that the French court seemed to desire his elevation, which prevented him from being raised to a still higher dignity. He died in Rome on Nov. 14, 1556. Casa was the leader of a reaction in lyric poetry against the universal imitation of Petrarch, and originated a style, which, if less soft and elegant, was more nervous and majestic than that which it replaced. His principal prose work is *Il Galateo* (1558), a treatise of manners, which has been translated into several languages. A reproduction of the English translation by R. Peterson (1576) was edited by H. J. Reid in 1897.

A complete edition of his works, which include translations from Thucydides, Plato and Aristotle, was published at Florence in 1707, to which is prefixed a life by Casotti. The best edition is that of Venice, 1752.

DELLA COLLE, RAFFAELLO, Italian painter, was born at Colle, near Borgo San Sepolcro, in Tuscany, about 1490. A pupil of Raphael, whom he is held to have assisted in the Farnesina and the Vatican, Della Colle, after his master's death, was the assistant of his chief pupil, Giulio Romano, at Rome and afterwards at Mantua. In his later years Della Colle resided at Borgo San Sepolcro, where he kept a school of design, among his many pupils of note may be mentioned Gherardi and Vecchi. His works, which are to be found at Urbino, at Perugia, at Pesaro and at Gubbio, are fine examples of the Roman school of Raphael.

DELLA CRUSCANS, THE, a group of insignificant versifiers, the leaders of which were R. Merry (actually a member of the Florentine academy *della Crusca*—see *ACADEMIES*) and Hannah Cowley. Their first production was a *Florentine Miscellany* (1785) to which Mrs. Proyn contributed. Returning to England in 1787 Merry began to publish verses in *The World*, and the collected poems of the group appeared in *The British Album* (1789, four editions). In 1791 William Gifford fell upon them in *The Bannad*, giving in his footnotes quotations which amply justify the severity of his satire. He renewed the attack in *The Maevad* (1795) and there are references to the Della Cruscans in T. J. Mathias's *Pursuits of Literature* (1794–97). The Della Cruscan manner, beyond furnishing a name for a particular kind of fantastic and insipid verse had no consequences for literature.

DELLA PORTA, GIOVANNI BATTISTA (c. 1538–1615), Italian natural philosopher, was born of a noble and ancient family at Naples about the year 1538. He travelled extensively in Italy, France and Spain, and was still a youth when he published *Magia naturalis, sive de miraculis rerum naturalium lib. IV* (1558), the first draft of his *Magia naturalis*, in 20 books, published in 1589. He founded in Naples the *Accademia Secretorum Naturae*, otherwise known as the *Accademia degli Onosii*, and in 1610 he became a member of the *Accademia dei Lincei* at Rome.

He died at Naples on Feb. 4, 1615.

Porta is the author of a number of books on cryptography, physiology of plants, farming, gardening optics, etc. He also wrote several Italian comedies. His most important work, the *Magna naturalis*, deals with a strange medley of subjects, including the reproduction of animals, the transmutation of metals, pyrotechny, domestic economy, statistics, hunting, the preparation of perfumes. Most of his work contains descriptions of experiments which were never performed and is much exaggerated. The only portions of any great interest are the experiments on magnetism and the optical experiments which include a description of the camera obscura (p. v).

DELLA QUERCIA, or **DELLA FONTE**, **JACOPO** (1374-1438), Italian sculptor, was born at Siena. He was the son of a goldsmith of repute, Pietro d'Agnolo. In 1394 he made an equestrian statue of Gian Tedesco. In 1402 he was one of six artists who submitted designs for the great gates of the baptistery in Florence, in which competition Ghiberti was the victor. In 1406 he executed one of his finest works, the monument of Ilaria del Carretto, wife of Paolo Guinigi, at Lucca, and received a commission for the famous Fonte Gaia, at Siena, early in 1409. This work was not seriously begun by him until 1414, and was only finished in 1419. In 1858 the remains of the fountain were removed to the Opera del Duomo, where they are now preserved, a copy of the original by Sarrocchi being erected on the site. After another visit to Lucca in 1422, he returned to Siena, and in March 1425 undertook the contract for the doors of S. Petronio, Bologna. He was known, in following years, to have gone to Milan, Verona, Ferrara, and Venice, but the rest of his life was chiefly divided between his native city and Bologna. In 1430 he finished the great font of S. Giovanni at Siena, which he had begun in 1417, contributing himself only one of the bas-reliefs, "Zuchinas in the Temple," the others being by Ghiberti, Donatello, and other sculptors. Among the work known to have been done by Jacopo may be mentioned also the reliefs of the *predella* of the altar of S. Frediano at Lucca (1422), and the Bentivoglio monument which was unfinished at the time of his death on Oct. 20, 1438. Jacopo della Quercia's work exercised a powerful influence on that of the artists of the later Italian Renaissance. He himself reflects not a little of the Gothic spirit, admirably intermixed with some of the best qualities of neo-classicism. His powers have hardly yet received the recognition they deserve.

See C. Cornelius, *Jacopo della Quercia eine Kunsthistorische Studie* (1896), and works relating generally to the arts in Siena (E. F. S.).

DELLA ROBBIA, the name of a family of great distinction in the annals of Florentine art. Its members are shown in the following table:

Simone di Marco				
Marco (1435-1525)		Luca (1400-1482)		
Giolamo (1488-1566), worked metals in France	Luca (1475-1550), worked in Florence and Rome	Paolo (1470-?), Dominican monk	Giovanni (1460-1520?), worked marbles in Florence	Marco (1468-?), Dominican monk

LUCA DELLA ROBBIA (1399 or 1400-1482) was the son of a Florentine named Simone di Marco della Robbia. According to Vasari he was apprenticed to the silversmith Leonardo di Ser Giovanni, this, however, appears doubtful from the great age which it would give to Leonardo and it is more probable that Luca was the pupil of Ghiberti. During the early part of his life Luca executed many important and exceedingly beautiful pieces of sculpture in marble and bronze. No sculptured work of the 15th century ever surpassed the singing gallery which he made for the cathedral at Florence between 1421 and 1438 with its ten magnificent panels of singing angels and dancing boys. This splendid work is now in the Museo del Duomo, and there is a cast in the Victorian and Albert museum, London, which also

possesses a study in *gesso duro*, apparently Luca's original sketch, for one of the panels.

In 1437 Luca received a commission from the signorina of Florence for five reliefs for the campanile, to complete the series begun by Giotto and Andrea Pisano. These panels, with representative figures typifying grammar, logic, philosophy, music and science, are much in the earlier style of Giotto. In 1439 Luca in association with Donatello received in order for two marble altars for chapels in the cathedral. The reliefs from one of them—St. Peter's Deliverance from Prison and his Crucifixion—are now in the Bargello. A tabernacle made by Luca in 1442 is now at Peretola, near Florence, in the church of S. Maria. In 1437 Donatello received a commission to cast a bronze door for one of the sacristies of the cathedral, but, as he delayed to execute this order, the work was handed over to Luca in 1446, with Michelozzo and Maso di Bartolomeo as his assistants. Part of this wonderful door was cast in 1448, and the last two panels were finished by Luca in 1467. It is divided into ten square panels, with small heads in the style of Ghiberti projecting from the framing. The subjects are the Madonna and Child, the Baptist, the four Evangelists, and the four Latin Doctors, each with attendant angels. The heads are full of life, and the treatment of the drapery in broad simple folds is worthy of a Greek sculptor of the best period of Hellenic art.

The most important existing work in marble by Luca (executed in 1455-56) is the tomb of Benozzo Federighi, bishop of Fiesole, originally in the church of S. Pancrazio at Florence, but removed to S. Francesco di Paola in 1783 and in 1898 to the church of SS. Trinita in Florence. A very beautiful effigy of the bishop lies on a sarcophagus sculptured with graceful reliefs of angels holding a wreath which contains the inscription. Above are three quarter length figures of Christ between St. John and the Virgin. The whole is surrounded by a rectangular frame of tiles of exquisite beauty, each painted in enamel pigments, with a bunch of flowers and fruit in brilliant realistic colours.

In the latter part of his life Luca was mainly occupied with the production of enamelled terra cotta reliefs. The rationale of this process was to cover the clay relief with an enamel formed of the ingredients of glass (*marzacotto*), made white and opaque by oxide of tin (See POTTERY and PORCELAIN *Italian Maiolica*). Though Luca was not the inventor of the process he extended its application to fine sculptured work in terra cotta, so that it is known now as Della Robbia ware. The great majority of these reliefs which in Italy and elsewhere are ascribed to Luca are really the work of some of the younger members of the family or of the atelier which they founded. Among the earliest of the comparatively few which can with certainty be ascribed to Luca himself are medallions of the four Evangelists in the vault of Brunelleschi's Pazzi chapel in S. Croce. These fine reliefs are coloured with various metallic oxides in different shades of blue, green, purple, yellow, and black. It has often been wrongly asserted that the polychromatic reliefs belong to Andrea or his sons, and that Luca's were all in pure white, or in white and blue. A relief in the Victoria and Albert museum furnishes a striking example that colours were used freely by Luca and is of especial value from its great size and because it is known. This is an enormous medallion containing the arms of Aragon and other heraldic devices. It is surrounded by a splendidly modelled and brilliantly coloured wreath of fruit and flowers especially apples, lemons, oranges and fir cones. This medallion was set up on the facade of the Pazzi Chapel to commemorate Rucellai's visit to Florence in 1412. Other reliefs by Luca, also in glazed terra cotta, are those of the Ascension and Resurrection in the tympanum of the doors of the sacristies in the cathedral executed in 1442 and 1446 and the tympanum relief of the Madonna between two Angels in the Via dell'Agnolo, a work of exquisite beauty, and another formerly over the door of S. Pierino di Merco to Vecchio but now removed to the Bargello. Among the few existing statues by Luca are two lovely enamelled figures of kneeling angels holding candlesticks now in the Victoria and Albert Museum. A very fine work executed between 1449 and 1452 is the tympanum relief of the Madonna and four Monastic Saints, over

the door of S. Domenico at Urbino. He also made the four coloured medallions of the Virtues set in the vault over the tomb of the young cardinal prince of Portugal in a side chapel of S. Miniato in Florence and various polychromatic medallions outside Or San Michele. The Victoria and Albert museum possesses 1. circular plaques of majolica were painted in blue and white with the Occupations of the Months, these have been attributed to Luca but their origin is doubtful.

In 1471 Luca refused to serve as president of the Florentine Guild of Sculptors, on account of his age and infirmity. He died on Feb. 20, 1482. His chief pupil was his nephew Andrea, and Agostino di Duccio, who executed many pieces of sculpture at Rimini, and the marble reliefs of angels on the façade of S. Bernardino at Perugia, may have been the work of one of his assistants.

ANDREA DELLA ROBBIA (1435-1525), the nephew and pupil of Luca was born Oct. 20, 1435, and died Aug. 4, 1525. He carried on the production of the enameled reliefs on a larger scale and also extended its application to various architectural uses, such as *frises* and to the making of lavabos, fountains and large reliefs. Though the finest reliefs from the workshop of Andrea were but little if at all inferior to those from the hand of Luca, some of those by pupils and assistants reached only a lower standard of merit. Only one work in marble by Andrea is known, an altar in S. Maria delle Grazie near Arezzo.

Andrea sometimes omitted the enamel on the face and hands (nude parts) of his figures, especially when he had treated the heads in a realistic manner, as in the noble tympanum relief of the meeting of St. Dominic and St. Francis in the loggia of the Florentine hospital of S. Paolo—a design suggested by a fresco of Fra Angelico's in the cloister of St. Mark's. One of the most remarkable works by Andrea is the series of medallions with reliefs of Infants in white on a blue ground set on the front of the founding hospital at Florence. He produced a large number of reliefs of the Madonna and Child, varied with much invention and all of extreme beauty of pose and sweetness of expression. These are frequently framed with realistic yet decorative garlands of fruit and flowers painted with coloured enamels, while the main relief is left white. The hospital of S. Paolo, near S. Maria Novella, has also fine medallions with reliefs of saints, two of Christ Healing the Sick, and two fine portraits, under which are white plaques inscribed "DALL'ANNO 1451 ALL'ANNO 1495." Arezzo possesses a number of fine enameled works by Andrea and his sons, a *retable* in the cathedral and in the chapel of the Campo Santo a fine relief of the Madonna and Child with four saints at the sides. In S. Maria in Grado is a very noble *retable* with angels holding a crown over a standing figure of the Madonna. Perhaps the finest collection of works of this class is at La Verna, not far from Arezzo. The three large *retables* with representations of the Annunciation, the Crucifixion, and the Madonna giving her Girdle to St. Thomas are probably the work of Andrea himself, the others being by his sons. In 1489 Andrea made a beautiful relief of the Virgin and two Angels, now over the archway door in the Florentine Opera del Duomo. In the same year he modelled the fine tympanum relief over a door of Prato cathedral, with a half-length figure of the Madonna between St. Stephen and St. Lawrence, surrounded by a frame of angels' heads.

In 1491 he was still working at Prato, where many of his best reliefs still exist. A fine bust of S. Lino exists over the side door of the cathedral at Volterra, which is attributed to Andrea. Other late works of known date are a magnificent bust of the Protomartyr Almachiano, made in 1510 for the church of S. Giovanni del Fiorentini at Viterbo, now preserved in the Palazzo Comunale there, and a medallion of the Virgin in Glory, surrounded by angels, made in 1505 for Pistoia cathedral. One of the latest works attributed to Andrea, though apparently only a workshop production of 1515, is a relief representing the Adoration of the Magi, made for a little church, St. Maria in Pian di Mugnone near Florence. Portions of this work are still in the church, but some fragments of it are at Oxford.

Five of Andrea's seven sons worked with their father and after

his death carried on the Robbia studio (see table).

LUCA II. The chief existing work known to be by the second Luca is the very rich and beautiful tile pavement in the uppermost story of Raphael's *loggia* at the Vatican, made at Raphael's request and under his supervision in 1518.

GIOVANNI DELLA ROBBIA (1469-1529?) was born May 19, 1469. He worked as assistant to his father, Andrea, and in many cases the enameled sculpture of the two cannot be distinguished. Some of Giovanni's independent works are of great merit, especially the earlier ones, during the latter part of his career his reliefs deteriorated in style, owing to the universal decadence of the time. One of his finest works is a *retable* representing the Last Judgment at Volterra in the church of S. Girolamo, dated 1501. Quite equal in beauty to anything of his father's is the lavabo in the sacristy of S. Maria Novella at Florence, made in 1497. In the tympanum of the arch is a very lovely white relief of the Madonna between two Adoring Angels. This part is of enameled clay, but the basin of the fountain is of white marble. Neither Luca nor Andrea was in the habit of signing his work, but Giovanni often did so, usually adding the date, probably because other potters had begun to imitate the Robbia ware. Among the very numerous other works of Giovanni are a relief in the wall of a former convent in the Via Nazionale at Florence, and two reliefs in the Bargello dated 1521 and 1522. At Pisa in the Campo Santo is a relief in Giovanni's later and poorer manner dated 1520, it is a Madonna surrounded by angels, with saints below. Giovanni's largest and perhaps finest work is the polychromatic *frise* on the outside of the Del Cippo hospital at Pistoia, for which he received various sums of money between 1525 and 1529, the subjects of this *frise* are the Seven Works of Mercy. Six of these reliefs are by Giovanni, the seventh, Giving drink to the Thirsty, was made by Filippo Paladini in 1585. Giovanni's chief pupil was Benedetto Buglioni (1461-1521), and a pupil of his, one Santa Buglioni (b. 1494), entered the Robbia workshops in 1521, and assisted in the later works of Giovanni.

GIROLAMO DELLA ROBBIA (1488-1566), another of Andrea's sons, was an architect and a sculptor in marble and bronze as well as in enameled clay. During the first part of his life he worked with his father, but in 1528 he went to France and spent nearly 40 years in the service of the French Royal family. Francis I. employed him to build a palace in the Bois de Boulogne called the Château de Madrid, decorated richly with terra cotta medallions, *frises* and other architectural features. For this purpose he set up kilns at Suresnes. Though the palace has been destroyed, drawings of it exist.

The best collections of Robbia ware are in the Florentine Bargello, Accademia, and Museo del Duomo, the Victoria and Albert museum (the finest out of Italy), the Louvre, the Cluny and the Berlin museums, while fine examples are to be found in New York, Boston, Leningrad and Vienna. Many fine specimens exist in private collections in England, France, Germany and the United States. The greater part of the Robbia work still remains in the churches and other buildings of Italy, especially in Florence, Fiesole, Arezzo, La Verna, Volterra, Barga, Montepulciano, Lucca, Pistoia, Prato, and Siena.

Florence, 1868).

DELMEDIGO, a Cretan Jewish family, of whom the following are the most important

ELIJAH DELMEDIGO (1460-1497) philosopher, taught in several Italian centres of learning. He translated some of Averroes' commentaries into Latin at the instigation of Pico di Mirandola. In the sphere of religion, Delmedigo represents the tendency to depart from the scholastic attitude in which religion and philosophy were identified. His principal work, *B'hamuth ha Dath* (Investigation of Religion), was devoted to this end.

JOSEPH SOLOMON DELMEDIGO (1591-1655), pupil of Gahlelo, wrote many books on science and philosophy, and bore a considerable part in initiating the critical movement in Judaism. He belonged to the sceptical school, and though his positive contributions to literature were not of lasting worth, Graetz includes him among the important formative influences within the synagogue of the 17th century.

DELMENHORST, a town, *Land* of Oldenburg, Germany, on the Delme, 8 m by rail W from Bremen, at the junction of a line to Vechta Pop (1939) 38,147. It is engaged in wool-combing, weaving, jute spinning and the manufacture of linoleum. Delmenhorst was founded in 1230, and from 1247 to 1679, when it was destroyed by the French, was protected by a strong castle.

DELOLME, JEAN LOUIS (1740-1806), Swiss jurist and constitutional writer, was born in Geneva in 1740 and died at Sewen, July 16, 1806. Having given offense to the authorities by a pamphlet entitled *Examen de trois parts de droit*, he was forced to take refuge in England, where he stayed until 1775. During his exile Delolme made a careful study of the English constitution, the results of which he published in his *Constitution de l'Angleterre* (Amsterdam, 1771), of which an enlarged and improved edition in English appeared in 1772. Along with a translation of Hume's *History of England* it supplied the philosophes with most of their ideas about the English constitution. It thus was used somewhat as a political pamphlet. Several editions were published after the author's death. Delolme also wrote in English, *Parallel between the English Government and the former Government of Sweden* (1772), *A History of the Flagellants* (1782), based upon a work of Boileau's, *An Essay on the Union of Scotland with England* (1787), and one or two smaller works. Notice by C Coote prefixed to the 1807 edition of the English translation of the *Constitution*.

DELONEY (or DELONE), **THOMAS** (1543?-1607?), English ballad-writer and pamphleteer. In 1588 the coming of the Armada inspired him to write three broadsides, which were reprinted (1806) by J. O. Halliwell-Phillips. A collection of *Strange Histories* (1607), known in later and enlarged editions as *The Royal Garland of Love and Delight* and *The Garland of Delight*, consists of historical ballads by Deloney, with some poems from other hands.

See the works of Thomas Deloney, ed. F. O. Mann, Oxford (1912).

DE LONG, GEORGE WASHINGTON (1844-1881?), American explorer, was born in New York city on Aug. 22, 1844. He graduated at the U.S. Naval Academy in 1865, entered the U.S. navy, attaining the rank of lieutenant in 1869, and lieutenant-commander in 1879. In 1875 he took part in the voyage of the "Junata," sent to search for and relieve the American Arctic expedition in the "Polaris," which was sent out from Upernavik, Greenland. In 1879 he again set out for the Arctic in the "Jeannette." The "Jeannette" was caught in the polar ice-pack Sept. 5, 1879, and drifted helplessly until June 13, 1881, when she was crushed and sunk. About 14 members of the expedition survived. De Long succeeded in reaching the mouth of the Lena river in one of the boats, only to die of starvation. His journal, in which he made regular entries until the day of his death, was edited by his wife and published in 1885, under the title of *Voyage of the "Jeannette"*. Three years after the ship was sunk several articles belonging to the crew of the "Jeannette" were found on an ice-floe on the eastern coast of Greenland, a fact that added fresh evidence to the theory of a continuous ocean current passing along the unknown Polar regions.

DELOORME, MARION (1613-1650), French courtesan, was the daughter of Jean de Lou, seigneur de L'Orme, president of the

treasurers of France in Champagne, and of Marie Chastelain. She was born at her father's chateau near Champaubert on Oct. 3, 1613. Initiated into the philosophy of pleasure by the epicurean and atheist, Jacques Vallee, seigneur de Sarrabau, she soon left him for Cinq Mars, whom she is said to have married secretly. Her salon became one of the most brilliant centres of elegant Parisian society. After the execution of Cinq Mars she is said to have numbered among her lovers Charles de St. Evremont (1610-1703) the wit and litterateur, the second duke of Buckingham (Villiers), the great Condé, and even Cardinal Richelieu and the king of France. Under the Fronde her salon became a meeting place for the disaffected, and her arrest is said to have been pending when she died on July 2, 1650. Legendary accounts declared that she lived until 1706 or even 1741, after having had the most fantastic adventures, including marriage with an English lord and an old age spent in poverty in Paris. She figures in Alfred de Vigny's *Cinq-Mars*, and in Victor Hugo's *Marion Delorme*.

See J. Peladan, *Histoire et légende de Marion de Lorme* (1927).

DE L'ORME, PHILIBERT (c. 1510-1570), French architect, one of the great masters of the Renaissance, was born at Lyons, the son and pupil of the architect Jehan de L'Orme. At an early age Philibert was sent to Italy to study (1533-36) and was employed there by Pope Paul III. Returning to France he was patronized by Cardinal du Bellay at Lyons, and was sent by him about 1540 to Paris, where he began the Chateau de St. Muir, in 1545 he was made architect to Francis I and given the charge of works in Brittany. In 1548 Henry II gave him the supervision of Fontainebleau, Saint Germain and the other royal buildings, but on his death (1559) Philibert fell into disgrace. Under Charles IX, however, he returned to favour, and was employed to construct the Tuileries, in collaboration with Jean Brillant. He died in Paris on Jan. 8, 1570. An ardent humanist and student of the antique, he yet vindicated resolutely the French tradition in opposition to Italian tendencies, he was a man of independent mind and a vigorous originality. His masterpiece was the Chateau d'Anet (1553-59), built for Diane de Poitiers, the plans of which are preserved in Du Cerceau's *Plus excellents bastimens de France*, and his designs for the Tuileries (also given by Du Cerceau), begun by Catherine de' Medici in 1565, were magnificent. His work is also seen at Chenonceaux and other famous châteaux, and his tomb of Francis I at St. Denis remains a perfect specimen of his art. He wrote two books on architecture (1561 and 1567).

See Chevalier, *Lettres et devis relatifs à la construction de Chenonceaux* (1864), Pior, *Monographie du château d'Anet* (1867), Marus Vachon, *Philibert de L'Orme* (1887), Herbet, *Travaux de P. de L'Orme à Fontainebleau* (1890).

DELOS (mod. *Mikra Dili*, or Little Delos, to distinguish it from Megali Dili, or Great Delos), an island in the Aegean, the smallest but most famous of the Cyclades, and, according to the ancient belief, the spot round which the group arranged itself in a nearly circular form. It is a rugged mass of granite, about 3 m. long and 1 m. to $\frac{1}{2}$ m. broad, about $\frac{1}{2}$ m. E. of Megali Dili or Rhenea, and 2 m. W. of Myconus. Towards the centre it rises to its greatest height of 350 ft. in the steep and rocky peak of Mount Cynthus, which, though overtopped by several eminences in the neighbouring islands, is very conspicuous from the surrounding sea.

Archaeology—Excavations have been made by the French school at Athens slowly but systematically since 1877. The sacred precinct of Apollo has been recovered, as well as the commercial quarter of Hellenistic and Roman times, the theatre, the temples of the twelve gods, the temples on the top of Mount Cynthus, and the numerous private houses. Sculpture of all periods has been found, and extensive series of inscriptions throwing light upon temple administration.

The ancient mole faces the channel between Delos and Rhenea. The precinct is approached by an avenue flanked by porticoes, upon the sea-side bearing the name of Philip V. of Macedonia, who dedicated it about 200 B.C. This was the usual approach for sacred embassies and processions, but Nicias, on the occasion of his embassy, built a bridge from the island of Hecate to Delos, that the Athenian procession might not miss its full effect. Facing

the avenue were the propylaea, the chief entrance, with a projecting portico of four columns. The sacred road continued across an open space, with the precinct of Artemis on its west side, and, on its east side, a terrace on which stood three temples. The southernmost of these was the temple of Apollo, but only its back was visible from this side. The other two faced west and were either dedicated to heroes or minor deities or were treasuries. Beyond them the road sweeps round to the front of the temple of Apollo. The outer side of this curve is bounded by a row of treasuries, similar to those at Delphi and Olympia, to house the offerings of various islands or cities. The temple of Apollo could also be approached directly from the entrance, through a passage with a porch at either end. Just to the north of this is the basis of the colossal Apollo dedicated by the Naxians, with its well-known archaic inscription and two large fragments of the statue itself.

The temple of Apollo, the centre of the whole precinct, was of Doric style, built early in the 4th century B.C. Its sculptural decoration was but scanty; the metopes were plain. The acroteria here now in the national museum at Athens, at the one end was Boreas carrying off Oreithyia, at the other Eos and Cephalus, the centre in each case being occupied by the winged figure. To the east of the temple was an oblong Prytaneum or other official building with colonnade on each side. Beyond it is the most interesting and characteristic of all the monuments of Delos, a long narrow hall, entered by a portico at its south end. At the north end was the famous altar, built out of the horns of the victims, which was sometimes reckoned among the seven wonders of the world. The rest of the room is taken up by a paved space, surrounded by a narrow gangway, and on this it is supposed that the *γῆραιος* or stork dance took place. The most remarkable architectural feature of the building is the partition that separated the altar from this long gallery, it consists of two columns between *antae*, with capitals of a very peculiar form, consisting of the fore parts of bulls set back to back, from these the whole building is sometimes called the sanctuary of the bulls. Beyond it, on the east, was a sacred wood filling the space up to the wall of the precinct, and at the south end of this was a small open space with the altar of Zeus Poseus.

At the north of the precinct was a broad road, flanked by votive offerings and exedrae, and along the boundary were porticoes, reception chambers and two entrances through extensive propylaea. At the north-west corner is a building of limestone, often mentioned in the inventories of treasures. South of it is the precinct of Artemis, containing within it the old temple of the goddess, her more recent temple was to the south, opening into the precinct of Apollo. The older temple is mentioned in some of the inventories as "the temple in which were the seven statues", and close beside it was found a series of archaic draped female statues, which was the most important of its kind until the discovery of the finer and better preserved set from the Athenian Acropolis. Outside the precinct of Apollo, on the south, was an open place, between this and the precinct was a house for the priests, and within it, in a kind of court, a set of small structures identified as the tombs of the Hyperborean maidens. To the east was the temple of Dionysus, of peculiar plan, on the other side of it was a large court, forming a commercial exchange, with a temple to Aphrodite and Hermes.

To the north between the precinct and the sacred lake, are extensive ruins of the commercial town including a sort of club or exchange and the new and the old palaestra. The shore of the channel facing Rheneia is lined with docks and warehouses, and behind them are private houses of the 2nd or 3rd century B.C. Each consists of a single court surrounded by columns and often paved with mosaic, various chambers open out of the court, including usually one of large proportions, the *εὐδοκίαν* or dining room for guests. The theatre, set in the lower slope of Mount Cynthus, has the wings of the auditorium supported by massive substructures. The *scenae* consisted of an oblong building of two storeys, surrounded by a low portico reaching to the level of the first floor. This was supported by pillars, set closer together along the front than at the sides and back. An inscription showed that

this portico, or at least the front portion of it, was called the *proscenium* or *logaeum*, two terms of which the identity was previously disputed. On the summit of Mount Cynthus, above the primitive cave temple which has always been visible, is a small precinct dedicated to Zeus Cynthus and Athena Cynthis. Some way down the slope of the hill, between the cave-temple and the ravine of the Inopus, is a terrace with the temples of the foreign gods, Isis and Serapis, and a small odeum.

History—Many alternative names for Delos are given by tradition, one of these, *Orthynia*, is elsewhere also assigned to an island sacred to Artemis. Of the various traditions that were current among the ancient Greeks regarding the origin of Delos, the most popular describes it as drifting through the Aegean till moored by Zeus for the wandering Leto, as a birthplace for Apollo and Artemis. The island first appears in history as the seat of a great Ionic festival to which the various Ionic States, including Athens, were accustomed annually to despatch a sacred embassy, at the anniversary of the birth of the god on the 7th of Thargelion (about May). In the 6th century B.C. the influence of the Delian Apollo was at its height, Polycrates of Samos dedicated the neighbouring island of Rheneia to his service and Pericles at Athens caused all the area within sight of the temple to be cleared of the tombs by which its sanctity was impaired. After the Persian wars, the predominance of Athens led to the transformation of the Delian amphictyony into the Athenian empire. (See DELIAN LEAGUE.) In 426 B.C., in connection with a reorganization of the festival, which henceforth was celebrated in the third year of every Olympiad, the Athenians instituted a more elaborate lustration, caused every tomb to be removed from the island, and established a law that ever after any one who was about to die or to give birth to a child should be at once conveyed from its shores. And even this was not accounted sufficient, for in 422 they expelled all its secular inhabitants, who were, however, permitted to return in the following year.

At the close of the Peloponnesian War the Spartans gave to the people of Delos the management of their own affairs, but the Athenian predominance was soon after restored, and survived an appeal to the amphictyony of Delphi in 345 B.C. During Macedonian times, from 322 to 166 B.C., Delos again became independent, and the temple and its possessions were administered by officials called *ἐπορτοί*. After 166 B.C. the Romans restored the control of Delian worship to Athens, but granted to the island various commercial privileges which brought it great prosperity. In 87 B.C. Mithradates, the general of Mithradates VI of Pontus, sacked the island, which had remained faithful to Rome. From this blow it never recovered, the Athenian control was resumed in 42 B.C., but Pausanias (viii 32) mentions Delos as deserted but for a few Athenian officials, and several epigrams of the first or second century A.D. attest the same fact, though the temple and worship were probably kept up until the official extinction of the ancient religion. A museum has now been built to contain the antiquities found in the excavations, otherwise Delos is now uninhabited, though during the summer months a few shepherds cross over with their flocks from Myconus or Rheneia. As a religious centre it is replaced by Tenos and as a commercial centre by the flourishing port of Syra.

BIBLIOGRAPHY—The French excavations are fully published in *Fouilles de Delos* (in progress), see also Th. Homolle, *Les Archives de l'administration sacrée à Delos* (with plan). For history, see Sir R. C. Jebb, *Journal of Hellenic Studies*, i (1889), pp. 7-62, and Pauly-Wissowa, *For works of art found at Delos* see GREEK ART.

DE LOUTHERBOURG, PHILIP JAMES (1740-1812), English artist, was born at Strasbourg on Oct. 31, 1740, where his father, of Polish descent, practised miniature painting, but he spent the greater part of his life in London, where he was naturalized, and exerted a considerable influence on the scenery of the English stage. De Louthembourg studied under Vanloo in Paris, and painted landscapes, sea storms, battles, all of which had some celebrity. He travelled in Switzerland, Germany and Italy, distinguishing himself as much by mechanical inventions as by painting. One of these, showing quite new effects produced in a model theatre, was the wonder of the day. The exhibition of lights behind canvas representing the moon and stars, the illusory

pearance of running water produced by clear blue sheets of tetril and gauze, with loose threads of silver, and so on, were his evicils. In 1771 he came to London, and was employed by Garrick, who offered him £500 a year to apply his inventions to Drury Lane and to superintend the scene painting, which he did with complete success. Garrick's own piece, the *Christmas Tale*, and the pantomime, 1781-82, introduced the novelties to the public, and the delight not only of the masses, but of Reynolds and the artists, was unbounded.

"Lord Howe's Victory off Ushant" (1794), and other large naval pictures were commissioned for Greenwich Hospital gallery, his finest work was the "Destruction of the Armada." A pamphlet published in 1780, entitled *A List of a few Cures performed by Mr and Mrs De Louthembourg without Medicine*, shows that he had taken up faith healing and he seems to have associated at the same time with Cagliostro. He died on March 11, 1812.

DELPHI (the Pytho of Homer and Herodotus, in Boeotian inscriptions Δελφοί, on coins Δελφοί), a place in ancient Greece in the territory of Phoebus, famous as the seat of the most important temple and oracle of Apollo. It was situated about 6 m. from the north shore of the Corinthian gulf, in a rugged glen, closed on the N. by the wall-like under cliffs of Mount Parnassus known as the Phaeades or shining rocks, and on the S. by Mount Cithrae. Between the two mountains the Pleistocene stream flowing from east to west, receives the brooklet which rises at the Cistallan fountain in a deep gorge in the Parnassian cliff. About 7 m. to the north, on the side of Mount Parnassus, was the famous Corycian cave, which afforded the people of Delphi a refuge during the Persian invasion. It is now called in the district the Sarant' Aulai or Forty Courts, and is said to be capable of holding 3,000 people.

I Site—The site of Delphi was occupied by the modern village of Castri until it was bought by the French government in 1891. Systematic excavation began in 1892. The plan of the precinct is now easily traced, and with the help of Pausanias many of the buildings have been identified.

The ancient "Hellenico" will running east and west and the two boundary walls running up the hill at each end of it, are clear. In the eastern part was the main entrance by which Pausanias entered along the Sacred Way. This road zigzags up the hill, with terraces and bases of offerings on both sides. First westwards to an open space, then eastwards till it reaches the eastern end of the terrace wall that supports the temple. Here it curves up north and then west towards the temple. Above this, are the Lesche and the theatre, and on a higher level still, to the west, is the stadium. In describing the monuments, the simplest plan is to follow Pausanias. Outside the entrance is a paved court flanked by a Roman colonnade. On the north side of the Sacred Way, close to the main entrance, stood the offering dedicated by the Lacedaemonians after the battle of Aegospotami, a quadrangular building with a back wall but stood open to the road. On a stepped pedestal stood statues of the gods and the admirals.

The statues of the Epigoni stood on a semicircular basis on the south side of the way, opposite them another semicircular basis carried the statues of the Argive kings. Farther west was the Sicyonian treasury south of the way, a small Doric temple in antis, with its entrance on the east. The sculptures from this treasury (in the museum) are in rough limestone, and now highly broken to pieces in the building.

The Corinthian treasury (originally named by the excavators as the treasury of Siphnos) stands south of the way further west. It is a small Ionic temple on a rubble with two columns, to be seen ante on a substructure. The sculpture from its pediment is of great interest, and the fragments of architectural mouldings etc. of great delicacy and beauty, perhaps the most perfect example of the transitional style of the late 5th century. Standing back from the path as it bends is the Ionic treasury, then where the path turns again, the Athenian. This structure a small Doric temple in antis, has been rebuilt with the original blocks. There can be no doubt about the identity of the building, for the basis bears the remains of the dedicatory inscription, stating that it was erected from the spoils of Marathon. The sculptured metopes are of the highest interest. The famous inscriptions with hymns to Apollo accompanied by musical notation were found on stones belonging to this treasury.

Above the Athenian treasury is the 'Sybil's rock'. Here, too, was placed the curious column, on which stood the colossal sphinx, dedicated by the Naxians, now in the museum.

A little farther on, but below the Sacred Way, another open space, of circular form, is perhaps the sacred threshing floor on which the drama of the slaying of the Python by Apollo was periodically performed. Opposite, and backed against the beautifully jointed polygonal wall which supports the terrace on which the temple stands, is the colonnade of the Athenians, now assigned to the end of the 6th century. The polygonal wall at the back is covered with inscriptions concerning the munimission of slaves.

After passing the Great Altar, dedicated by the Chians, on the left the way enters the spile in front of the temple, with remains of offerings by the Cyrenians and by the Corinthians. The site of the temple shows successive structures. Of that built by the Alcmaeonids in the 6th century B.C. considerable remains have been found. Sculptures assigned to this building are archaic and resemble those from the early temple of Athena at Athens. The existing foundations are of the 4th century. They give no certain information as to the sacred cliff and other matters relating to the oracle. Up in the north eastern corner of the precinct, at the foot of the cliffs, is the interesting Cnidian clubhouse, a long narrow building, the famous paintings were probably disposed so as to meet in the middle of the north side. Scanty fragments of the frescoed walls are not enough to give information as to the work of Polygnotus.

At the north western corner of the precinct is the theatre. The stadium lies to the north-west on a narrow plateau supported by a terrace wall. The seats are well preserved, some are hewn in the rock. An immense number of inscriptions have been found in the excavations, and many works of art, including a bronze chryseote (see GREEK ART).

II History—Our information as to the oracle at Delphi and how it was consulted is confused, probably ritual varied. The title of intoxicating "mephitic" vapour has no early authority, nor is it scientifically probable. The questions had to be given in writing, and the responses were uttered by the Pythian priestess, in early times a maiden, later a woman over 50 uttered as a maiden. After chewing the sacred bay and drinking of the spring Cassotis, which was conducted into the temple by artificial channels, she took her seat on the sacred tripod in the inner shrine. Her utterances were reduced to verse and edited by the prophets and the "holy men" (δωαί). (See also ORACLE.)

Delphi also contained the "Omphalos," a sacred stone bound with fillets, supposed to mark the centre of the earth. It was said Zeus had started two eagles from the opposite extremities and they met there. Other tales said the stone was the one given by Rhea to Cronus as a substitute for Zeus.

For the history of the Delphic Amphictyony see under AMPHICTYONY. The oracle at Delphi was asserted by tradition to have existed before the introduction of Apollo worship and to have belonged to the goddess Earth (Ge or Gaia). The Homeric Hymn to Apollo evidently combines two different versions, the approach of Apollo from the north by land, and the introduction of his votives from Crete. The earliest stone temple built by Trophonius and Agamedes, was destroyed by fire in 548 B.C., and the contract for a building was given to Croesus by the exiled Alcmaeonidae from Athens. The contract was fulfilled in marble on the eastern front of the present temple. Portions of the pediments of this temple have been found in the excavations, but no sign of the pedimental metopes. Pausanias, representing on the east Apollo and the Muses, and on the west Dionysus and the Thyades (Bacchantes) and the figure of Praxias, the pupil of Calamius. The temple was built by the Alcmaeonidae (of which the foundations were found in the excavations) at the end of the 4th century.

A raid on Delphi attempted by the Persians in 480 B.C. was said to have been frustrated by the god himself, by means of a storm or earthquake which hurled rocks down on the invaders, a similar tale is told of the raid of the Gauls in 279 B.C. But the

sacrilege thus escaped was inflicted by the Phocian defenders of Delphi during the Sacred War, 356–346 B.C., when many precious offerings were melted down. The Phocians were condemned to replace their value to the amount of 10,000 talents, which they paid in instalments. In 86 B.C. the sanctuary and its treasures were put under contribution by L. Cornelius Sulla for the payment of his soldiers. Nero removed no fewer than 500 bronze statues from the sacred precincts. Constantine the Great enriched his new city by the sacred tripod and its support of intertwined snakes dedicated by the Greek cities after the battle of Plataea. This still exists, with its inscription, in the Hippodrome at Constantinople. Julian afterwards sent Orbasius to restore the temple, but the oracle responded to the emperor's enthusiasm with nothing but a wail over the glory that had departed.

Provisional accounts of the excavations appeared during the excavations in the *Bulletin de correspondance hellénique*. A summary is given in J. G. Frazer, *Pausanias*, vol. V. The official account is entitled *Fouilles de Delphes*. For history see Hiller von Gattlingen in *Pauli, Wissowa, Realencyclopädie*, s.v. "Delphi." For cult see L. R. Farnell, *Cults of the Greek States*, iv, 179–218.

DELPHINIA, a festival of Apollo Delphinus held annually on the 6th (or 7th) of the month Munychion (April) at Athens. All that is known of the ceremonies is that a number of girls proceeded to his temple (Delphinium) carrying suppliants' branches and seeking to propitiate Apollo, probably as a god having influence on the sea. It was at this time of the year that navigation began again after the storms of winter. According to the story in Plutarch (*Thesens*, 18), the festival was instituted by Theseus (q.v.) to commemorate his voyage to Crete.

See A. Mommsen, *Festeder Stadt Athen* (1898), Preller-Robert, I, 260, P. Stengel, *Die griechische Kultus-altertum* (1898), Daremberg and Saglio, *Dictionnaire des antiquités*, G. F. Schoemann, *Griechische Altertümer* (4th ed., 1897–1902).

DELPHINIUM, a genus of herbaceous plants of the crow-foot family (Ranunculaceae), comprising 150 or more species, native to north temperate regions, several of which are widely cultivated for their irregular but very showy flowers. The rocket larkspur (*D. Ajacis*) occurs in Great Britain and is somewhat naturalized in the eastern United States and Canada. Upwards of 40 species are natives of North America, most numerous in the Rocky Mountain region and on the Pacific coast, some of which are poisonous to grazing animals. Among the best known are the dwarf larkspur (*D. tricolor*), the tall larkspur (*D. exaltatum*), and the prairie larkspur (*D. carolinianum*) of the eastern and central states, the mountain larkspur (*D. occidentale*), of the central Rockies, and the cardinal larkspur (*D. cardinale*), and the red larkspur (*D. nudicaule*), of the Pacific coast. Among the most extensively cultivated forms are the rocket larkspur, native to Europe, the field larkspur (*D. Consolida*), native to Asia, the bouquet larkspurs derived from *D. grandiflorum*, of eastern Asia, and the candle larkspurs, probably derived chiefly from *D. elatum*, of Eurasia.

DELPHINUS, a small constellation (q.v.) appearing in the northern hemisphere not far from Altair, the brightest star of the constellation Aquila (q.v.). As its name signifies, it was supposed by the ancients to represent a dolphin. γ Delphinus is a double star, the yellowish component being of magnitude 4, and the bluish component of the 5th magnitude (see STAR).

DELPHOS, a city of western Ohio, U.S.A., in Allen and Van Wert counties, 70 mi. S.W. of Toledo. It is on federal highway 30, and is served by the Nickel Plate, the Akron, Canton and Youngstown and the Pennsylvania railways. The population in 1950 was 2,469, in 1940, 5,746 by federal census. The city has railroad shops, a galvanizing plant and other manufacturing industries.

DEL RIO, a city of southwestern Texas, U.S., on the Rio Grande, 150 mi. W. of San Antonio, county seat of Val Verde county. Del Rio is on federal highways 90 and 277 and the Southern Pacific railway.

Across the Rio Grande is the Mexican city of Villa Acuña. Population of Del Rio, 1950 census, was 14,192. Val Verde county (Del Rio) is the largest wool, sheep and lamb producing county in the United States.

Shipped annually from Del Rio are 8,000,000 lb. of wool, 400–

000 lambs and 5,000,000 lb. of mohair. The city was founded in 1872 and has a commission form of government.

DELTA, the tract of coastal land bounded by the most divergent branches of a river's mouth, and traversed by other tributaries of the stream. The name comes from the shape of the delta resembling the Greek (Δ) letter of that name. This triangular area is formed from the fine silt brought down in suspension by a muddy river and is deposited when the river's current becomes ineffective on reaching the sea. When tidal currents are insignificant, the delta advances seawards, forming a local addition to the coastal land. The term, by analogy, is now applied to like deltas and also to tributary river deltas. In the latter case the feature is usually small and occurs where a swift muddy tributary enters a slowly flowing main stream. Lake deltas formed by an entering stream at the side of a lake occasionally grow outwards as far as the opposite shore and result in the lake being divided into two separate water areas, e.g., Thun and Brienz in Switzerland.

DELTA RAYS, a stream of slowly moving electrons emitted when α particles impinge on matter (see RADIOACTIVITY, NATURAL).

DELUC, JEAN ANDRE (1727–1817), Swiss geologist and meteorologist, was born at Geneva on Feb. 8, 1727 and spent his early manhood in business and politics in his native city. He settled in England in 1773, and became reader to Queen Charlotte, a position which gave him a competency and leisure to travel in pursuit of his scientific studies. Deluc, who was a fellow of the Royal Society, died at Windsor on Nov. 7, 1817.

His principal geological work *Lettres physiques et morales sur les montagnes et sur l'histoire de la terre et de l'homme* (1778, ed. ed. 1779) explained the six days of the Mosaic creation as so many epochs preceding the actual state of the globe. Deluc discovered many important facts relating to heat and moisture. He noticed the disappearance of heat in the thawing of ice about the same time that J. Black founded on it his ingenious hypothesis of latent heat. He ascertained that water was more dense about 40° F (4° C) than at the temperature of freezing, expanding equally on each side of the maximum, and he was the originator of the theory, revived later by Dalton, that the quantity of aqueous vapour contained in any space is independent of the pressure or density of the air, or of any other elastic fluid.

In the *Phil. Trans.*, 1773, appeared his account of a new hygrometer, which resembled a mercurial thermometer, with an ivory bulb, which expanded by moisture, and caused the mercury to descend. The first correct rules ever published for measuring heights by the barometer were those he gave in the *Phil. Trans.*, 1771, p. 158. He sent to the Royal Society, in 1809, a long paper on separating the chemical from the electrical effect of the pile, with a description of the electric column and aerial electroscope, in which he advanced opinions so little in unison with the latest discoveries of the day, that the council deemed it inexpedient to admit them to the *Transactions*. The paper was afterwards published in Nicholson's *Journal* (xxvi), and the dry column described in it was constructed by various experimental philosophers. This dry pile or electric column has been regarded as his chief discovery.

His other works include *Recherches sur les modifications de l'atmosphère* (Geneva, 3 vols., 1772), which contains accounts of many physical experiments, and *Traité élémentaire de géologie* (1809, Eng. trans., 1809), in relation of the Vulcanian theory of Hutton and Playfair. Many of his papers on subjects kindred to those mentioned are to be found in the *Transactions* and in the *Philosophical Magazine*. See *Philosophical Magazine* (Nov. 1817).

DELUGE is the name given to a great flood of water submerging the whole or a large part of the earth's surface. Legends of such floods occur in the traditions of many peoples. Collections of these legends have been made by several scholars, notably R. Andree (*Die Flutungen*, 1891), M. Winternitz (*Die Flut sagen des Alterthums und der Naturvolker*, 1901), and J. G. Frazer (*Folklore in the Old Testament*, vol. 1, pp. 104–361).

Hebrew Traditions—The most familiar of these stories is that related in Genesis vi–ix. It has long been recognized that the Biblical record consists of two distinct traditions which have been dovetailed by an editor to make a consecutive story. One of

these comes from the Yahwist document J, the other from the "priestly" source P. The matter common to the two traditions tells of God's anger at the iniquity of mankind, whom He therefore proposes to destroy by a flood. Noah, whose piety finds favour in God's eyes, is instructed to take into his "ark" his family and specimens of all beasts and birds. (In J the animals fit for sacrifice are taken by sevens, the others by twos, but in P all alike by twos.) A great flood is caused by rain—P adds also an uprush of the subterranean waters—in which all men other than those in the ark perish, but God promises that no similar flood shall ever occur again. Peculiar to the J story are the details that Noah sends out birds from the ark to test the subsidence of the waters and that Noah, after he comes out of the ark, offers a sacrifice, which God smells. Peculiar to the P story are the warning given to Noah, the elaborate instructions as to the making of the ark, and in particular the mention of bitumen, the resting of the ark upon a mountain in Ararat, and the rainbow sign. No doubt there were parallels to some features in one or other documents which have disappeared in the dovetailing process. The time notes show considerable variation. In J the flood culminates in 40 days, in P it reaches its climax in 150 days. In J the animals take seven days to enter the ark, but seemingly only one in P.

Babylonian Traditions.—Numerous traditions resembling the Genesis story have been found in Babylonia. Most of them are, unfortunately, but fragments. The best-known forming the 11th tablet of the Gilgamesh Epic, is elaborate, and the experiences of Utnapishtim bear striking resemblances to those of Noah. The Gilgamesh story, for example, relates the sending forth from the ark of three birds in succession—dove, swallow, raven, instead of a dove three times as in Genesis (where the raven probably does not belong to the original text). It mentions the bitumen, using the same word as Genesis, and speaks of the ark grounding on a mountain. The offering of the sacrifice is mentioned, with the detail, in almost identical words, that the gods smell the savour. The Babylonian traditions reflect a higher level of civilization. Utnapishtim takes into his ark not only animals but treasure and craftsmen of all kinds, so that not only all kinds of animals but all different crafts may be preserved. One of the craftsmen was a sailor, to whom, very prudently, Utnapishtim entrusted the navigation of his vessel during the flood. The version of Berossus, a Babylonian priest who wrote at Babylon c. 300 B.C., which is doubtless much older than its recorder, shows also a care for literature in the detail that its hero buries before the flood a written account of "the beginning, middle and end of all things," dismaying it when the flood had gone. But the Biblical story reaches the higher religious and ethical levels. Its majestic conception of God is in striking contrast with the many gods of the Babylonian story, who suffer from human weaknesses such as cowardice, intrigue and deceit. It is hardly fair to say that the Babylonian record is without ethical qualities. In at least one version the piety of the hero is emphasized. In the Gilgamesh version the god Ea protests that only the guilty should have been punished, from which it may be inferred that the flood was intended as a punishment for sinful men. But in any case the sense of sin is much more definitely expressed in Genesis.

Relation Between Hebrew and Babylonian Traditions.—However clear may be the moral and religious superiority of the Biblical versions it remains true that the many striking points of resemblance make it absolutely certain that they are not independent of the Babylonian traditions. Since the latter are the older—even some of the written forms in which they come to us are several centuries older than the Mosaic period—they must, if the dependence be direct, be regarded as the cruder material which the Genesis tradition has received. It would have been possible for the early Hebrews to learn the story either from Babylon itself or, more probably from the Chaldeans, for Canaan was very much under the influence of Babylonia. This is, indeed, the view most generally held by scholars. It is urgent that the story is much more likely to have arisen in a country liable to inundations like Babylon than in Canaan. The elaborate description of the ark, too, seems much more plausibly to

have originated in Babylonia than among a people so little accustomed to the sea and its ways as were the Hebrews. A. T. Clay, however, has effectively criticized the proposition that the descriptions of the deluge exactly fit the alluvial plain of Babylonia. In the cuneiform records the cause of the flood is invariably heavy rain, and not inundation from river or sea. Statistics seem to show that the average rainfall in Babylonia is by no means heavy, and therefore one of the main arguments for thinking the story indigenous to Babylonia is weakened. The theory of Suss, that the real cause of the flood was water driven in by a typhoon from the Persian gulf, though accepted by many scholars, has no foundation in the tradition itself. On the whole it is safer to conclude that, while there is undoubtedly a close kinship between the Biblical and the Babylonian traditions, the evidence hardly warrants a dogmatic assertion that the former are derived directly from the latter. In view of the widespread prevalence of similar traditions, and of the fact that, like the account in Genesis, the one in the Gilgamesh Epic is probably composite, it would be safer to say that both derive material from some common source.

Greek Traditions.—The most familiar of the Greek flood stories—later elaborated by Ovid—is that told by Apollodorus. It recounts how Deucalion, king of the country round Phthia, and his wife, Pyrrha, escaped from a flood caused by Zeus pouring water on the earth. The escape was made in a chest, which Deucalion had previously constructed on the advice of his father Prometheus. In this they floated for nine days over the sea, until the chest grounded on Mt. Parnassus. After the rain had ceased Deucalion emerged from the chest and offered sacrifice to Zeus. Being granted a boon by the god he chose men, Zeus bade him throw stones over his head, and these became men, while stones similarly thrown by Pyrrha became women. It is true that the story in this form is not older than the 2nd century B.C., but Hellanicus, a historian of the 5th century B.C., has a version of it in which the chest grounds on Mt. Othrys in Thessaly, and slightly older is the version of Pindar, in which the mountain is Parnassus. A Megarian account specifies Mt. Gerania.

But the tradition varies in features more important than this in some versions Deucalion is replaced by Oggyes, founder of Thebes in Boeotia, or by Dardanus, who was a king in Arcadia. Frazer hazards the guess that the Oggyes story may be founded on an extraordinary inundation of the Copac lake, which formerly occupied a large part of central Boeotia, and thinks this theory may find some support from the Dardanus legend, for in one tradition the birthplace of Dardanus was Pheneus in northern Arcadia, and "no valley in Greece is known to have been from antiquity subject to inundations on so vast a scale and for such long periods as the valley of Pheneus." On the whole, however, he is more inclined to the theory that the story may have been suggested by a desire to explain the origin of the gorge of Tempe, which was thought to be the opening burst by a vast lake once dammed by the circle of the Thessalian mountains. It is not easy to trace connection between the Greek and Babylonian traditions. The most likely link would be Hittite tradition. But though it is asserted that the Hittite deluge hero Ul (Ilush) is the same as Ulysses (=Odysseus) this does not help very much.

Other Traditions.—Apart from Greek flood legends are comparatively rare in Europe. Examples are found in Wales, Lithuania and Iceland, the last-named has a striking note of difference in that its deluge is caused by blood flowing from a wounded giant. India furnishes much material in the later Sanskrit literature. The earliest record goes back to the 6th century B.C. It tells how the hero, Manu, was warned by a fish of the coming flood, and advised to prepare a ship as a means of escape. When the flood came Manu's fish towed the ship to a mountain in the far north. After the waters had receded Manu offered a sacrifice, from the materials of which a woman was evolved. This story is repeated, with variations, in still later Sanskrit books, and similar stories are found in the folk-lore of existing Indian tribes. In Frazer's opinion the main theme of the legend may be aboriginal and form the source of the Sanskrit versions. He is also inclined to agree with Sir Marc Aurel

Stem that one at least of the stories may be explained as the product of imagination working on the existence of a gorge, which, like the gorge of Tempe mentioned earlier, drains an area enclosed by mountains

Deluge stories are found in China, Burma, Cochina China, Malay, the Indian archipelago, among the aborigines of Australia, in New Guinea, and abundantly in the islands of Melanesia, Polynesia and Micronesia They are plentiful also in South, Central and North America

A survey of the whole field shows that deluge stories are common in Southern Asia, but not found in the rest of that continent, the examples quoted from China and Japan generally not answering to the description of universal inundations Europe furnishes a few, Africa hardly any It is especially noteworthy that we have none from the valley of the Nile On the other hand, America and the islands of the Southern Seas are prolific in these stories

Origin of Traditions—Are these widespread legends connected? The Sumerian story seems to be the oldest, but it is difficult to derive the others from it Frazer is certain that the Hebrew story descends from the Babylonian, but sees no decisive grounds for believing that the others do He emphatically, and rightly, rejects the view that the various deluge traditions were originally myths relating to the voyages of the sun and moon in the heavens His own view is that many of the stories may arise from the inundations caused by the far-reaching tidal waves that accompany earthquakes, and some from inundations caused by rain Frazer's final verdict is "while many diluvial traditions are based on reminiscences of catastrophes which actually occurred, there is no good ground for holding that any such traditions are older than a few thousand years at most, wherever they appear to describe vast changes in the physical configuration of the globe they probably embody, not the record of contemporary witnesses, but the speculation of much later thinkers"

BIBLIOGRAPHY—Besides the collections named at the beginning of the article see Skinner, "Genesis," *Internal Crit Comm* pp 147-181 (1912); W L Wardle, *Israel and Babylon*, pp 283-335, 1912; articles "Deluge" in *Encycy of Religion and Ethics* and *Encyclopaedia Biblica*, "Flood" in *Hastings' Dictionary of the Bible* (W L W)

DELUSION is an erroneous belief, usually rather persistent and more elaborate in character than hallucinations or illusions, inasmuch as it is commonly based on more or less elaborate, if fallacious, reasoning Delusions may result from ignorance or prejudice, or they may be due to mental abnormality, known as "delusional insanity" In the most serious cases they are confined to a few subjects such as persecution or personal eminence, etc See **ABNORMAL PSYCHOLOGY, HALLUCINATION, ILLUSION**

DELYANNI, THEODOROS (1826-1905), Greek statesman, was born at Kalavryta, Peloponnesus, in 1826 He studied law at Athens, and entered the civil service In 1862, he became minister for foreign affairs In 1867 he was minister at Paris In the so-called "Oeconomical Ministry" of 1877 he voted for war with Turkey, and on its fall he entered the cabinet of Koumoundouras as minister for foreign affairs He was a representative of Greece at the Berlin congress in 1878 From this time forward, and particularly after 1882, when Tricoupi again came into power at the head of a strong party, the duel between these two statesmen was the leading feature of Greek politics (See **GREECE Modern History**) Deliyanni first formed a cabinet in 1885, but his warlike policy ended in failure He returned to power in 1890, with a radical programme, but his failure to deal with the financial crisis produced a conflict between him and the king, and his disrespectful attitude resulted in his summary dismissal in 1892 In 1895, however, he again became prime minister, and was at the head of affairs during the Cretan crisis and the opening of the war with Turkey in 1897 The humiliating defeat which ensued—though Deliyanni himself had been led into the disastrous war policy to some extent against his will—caused his fall in April 1897, the king again dismissing him from office when he declined to resign Deliyanni kept his own seat at the election of 1899, but his following dwindled to small dimensions He was again president of the council and minister of the interior when, on June 13, 1905, he was murdered in revenge for the rigorous measures taken by him against gambling houses

DEMADES (c 380-315 B.C.), Athenian orator At one time a common sailor, he rose by his eloquence and unscrupulous character to a prominent position He espoused the cause of Philip in the war against Olynthus, and thus became the enemy of Demosthenes, whom he at first supported He fought against the Macedonians at Chaeronea, and was taken prisoner On his release he helped to negotiate peace between Macedonia and Athens He continued to be a favourite of Alexander, and, prompted by a bribe, saved Demosthenes and the other obnoxious Athenian orators from his vengeance It was also chiefly owing to him that Alexander, after the destruction of Thebes, treated Athens so leniently His conduct in supporting the Macedonian cause, yet taking bribes from the opposite party, caused him to be heavily fined more than once, and he was finally deprived of his civil rights He was reinstated (322) on the approach of Antipater, to whom he was sent as ambassador Before setting out he persuaded the citizens to pass sentence of death upon Demosthenes and his followers, who had fled from Athens The result of his embassy was the conclusion of a peace greatly to the disadvantage of the Athenians In 318 (or earlier) he was again sent to Antipater, who, learning that he had intrigued with Perdiccas, put him to death

A fragment of a speech (*Περὶ δολοχίας*), bearing his name, in which he defends his conduct, is to be found in C Müller's *Oratores Attici*, II, 438, but its genuineness is exceedingly doubtful

DEMAGOGUE, a leader of the popular as opposed to any other party (Gr *δημαγωγός*, from *δῆμος*, to lead, and *δηγός*, the people) Used in an invective sense, a mob leader or orator, one who for his own political ends panders to the passions and prejudices of the people

DEMAND In economics, as in trade, demand denotes the extent of the outlet or market which the wants and preferences of buyers, joined to their purchasing power, establish for particular goods or services Demand is always relative to price, and the character of the relation is commonly exhibited in treatises on economics either arithmetically (in "demand schedules") or diagrammatically (in "demand curves") by showing in sequence the amount of a commodity which supposedly would be purchased at each price in an ordered series of prices The inaccurate statement that "an increase of prices will diminish demand" really means that an increase in price will diminish the volume of potential sales The statement "an increase of demand will raise the price" means that a shift to the right in the position of the demand curve tends to raise the price The relationship between price and the amounts which buyers will purchase is generally inverse, that is, sales volume is commonly larger at lower than at higher prices This elementary theorem rests in the first instance upon common observation of the facts of the market, but it can be explained by or related to the way in which households and individual consumers apportion their expenditures Most goods serve a variety of purposes, and these purposes differ greatly in importance If the price of a commodity increases, consumers generally cannot continue to buy it in undiminished quantities without cutting into their expenditures for other goods so deeply as to sacrifice some of their relatively important uses They will prefer to give up some relatively unimportant uses of the commodity which has increased in price, and will therefore reduce their purchases of it

The extent to which a change of price affects the quantity of a commodity which can be sold is called the elasticity of demand The greater the ratio of the proportionate change in potential sales volume to the proportionate change in price, the greater is said to be the elasticity of demand This ratio is called the co-efficient of elasticity Thus if a large wheat or cotton crop will sell for less in the aggregate than a smaller crop would have sold for, within certain limits, the demand for wheat and cotton is comparatively inelastic, and the co-efficient of elasticity is less than unity In general, the demand for necessities, for goods for which there are no substitutes, and for goods the use of which creates a habit is relatively inelastic The elasticity of the demand for any commodity is rarely the same over any considerable range of prices The demand for salt,

for example, would be much less elastic at high than at low prices. H. L. Moore and other scholars, by making skilful use of statistics of the production and prices of certain commodities and of the general movements of prices, have been able to find formulae which express approximately the relations (for the time being) between the prices of those commodities and the demand for them. These empirical laws of demand add materially to our economic knowledge, and promise to be useful in forecasting the probable effects of increased or decreased production upon prices.

The demand for any one commodity is dependent not only upon its own price but upon the prices of other goods as well. There are many instances of joint demand, as where a falling off in the price of fresh fruit leads to increased purchasing of sugar, and of competing demand, as where a reduction of the cost of electric lighting leads to a smaller use of illuminating gas. So far, indeed, as a change of the price of any commodity whatsoever affects the amount of money expended for it, the demand for other goods must be affected. The demands for labour, land, and productive instruments are derived from the demands for their products. In some instances the relation between the demand for consumer's goods and the derived demand for productive goods and services is fairly direct and simple. More often, however, this relation is exceedingly intricate, because productive agents can be combined in various ways and in various proportions. What the most economical combination of productive agents for any one purpose is will depend upon the demand not for one but all of their possible products.

DEMAND AND SUPPLY see SUPPLY AND DEMAND

DEMAND LOAN see CALL MONEY

DEMANOID see GARNET

DEMARATUS, king of Sparta of the Euryponid line, successor of his father Ariston (Doric Δαμάρατος, Ionic Δημάρατος). He is known chiefly for his opposition to his colleague Cleomenes I (qv) in his attempts to make Isagoras tyrant in Athens and afterwards to punish Aegina for medizing. He did his utmost to bring Cleomenes into disavowal at home. Thereupon Cleomenes urged Leotychides, a relative and personal enemy of Demaratus, to claim the throne on the ground that the latter was not really the son of Ariston. The Delphic oracle, bribed by Cleomenes, pronounced in favour of Leotychides, who became king (491 BC). Soon afterwards Demaratus fled to Darius, who gave him the cities of Pergamum, Teuthræa and Halisarna, where his descendants were still ruling at the beginning of the 4th century (Xen. *Anabasis*, II 1.3, VI 8.17, *Hellenica*, III 1.6), to these Gambreus should perhaps be added (Athenæus I 29 f). He accompanied Xerxes on his expedition to Greece, but the stories told of the warning and advice which on several occasions he addressed to the king are scarcely historical.

See Herodotus v 75, vi 50-70, vii 1, later writers either reproduce or embellish his narrative (Pausanias II 4.3-5, 7.7-8, Diodorus vi 6, Polyænus II 20, Seneca, *De beneficiis*, vi 34, 4-12). The story that he took part in the attack on Argos which was repulsed by Telesilla, the poetess, and the Argive women, can hardly be true (Plutarch, *Mul. virt.* 4, Polyænus, *Strat. vii* 33, G. Busolt, *Griechische Geschichte*, II 563, note 4). (M N T)

DEMAVEND, MOUNT An extinct volcano in the Elburz mountains, Persia, with an altitude of 17,930 feet. It has supplies of sulphur and pumice.

DEMENTIA PRAECOX: see INSANITY

DEMERARA, one of the three counties of British Guiana, taking its name from the river Demerara. (See GUAYANA)

DEMESNE, that portion of the lands of a manor not granted out in freehold tenancy, but (a) retained by the lord of the manor for his own use and occupation or (b) let out as tenement land to his retainers or "villeins". This demesne land, originally held at the will of the lord, in course of time came to acquire fixed tenure, and developed into the modern copyhold (see MANOR). It is from demesne derived the sense (a) that the modern restricted use of the word comes to, i.e. land immediately surrounding the manor or dwelling house, the park or chase. *Demesne of the Crown*, or royal demesne was that part of the crown lands not granted out to feudal tenants, but which

remained under the management of stewards appointed by the crown. These crown lands, since the accession of George III, have been appropriated by parliament, the sovereign receiving in return a fixed annual sum (see CROWN LANDS; CIVIL LIST). *Ancient demesne* signified lands or manors vested in the king at the Norm. Conquest. There were special privileges surrounding tenancies of these lands, such as freedom from tolls and duties, exemption from damage and amercement, from sitting on juries, etc. Hence, the phrase "ancient demesne" came to be applied to the tenure by which the lands were held. Land held in ancient demesne is sometimes also called customary freehold (see COPYHOLD).

DEMETER, in Greek mythology, daughter of Cronus and Rhea and sister of Zeus, goddess of agriculture. Her name has been explained as (1) "grain mother," from *dēai*, the Cretan form of *ῥεαί*, "barley," or (2) "earth mother," or rather "mother earth," *dā* being regarded as the Doric form of *γῆ*. She is rarely mentioned in Homer, nor is she included among the Olympian gods.

The central fact of her legend was the story of her daughter Persephone. After her carrying off by Hades (see PERSEPHONE), Demeter revealed to the people of Eleusis, where she had been hospitably received, her secret rites (see TRITOLEMUS). This is the legendary origin of the famous Eleusinian mysteries (see MYSTERY). The Eleusinia, sometimes confused with them, were a distinct festival.

Demeter is a mother goddess. Besides Zeus, she has a consort Iasion, who "lay with her in a thrice ploughed field" (Homer, *Od.* v 125 *et seq.*), and to whom she bore Plutus (*qv*)—"Wealth," (i.e., abundant produce of the soil). The story is compared by Frazer (*Golden Bough*, 3rd ed. vii 207) with the West Prussian custom of the mock birth of a child on the harvest field, the object being to ensure a plentiful crop for the coming year. In Homer the scene is laid in Crete, and may well represent part of the ritual or mythology of the Cretan goddess Erysichthon ("tearer up of the earth"), son of Triopas or Myrmidon, having cut down the trees in a grove sacred to the goddess, was punished by her with terrible hunger (Callimachus, *Hymn to Demeter*, Ovid, *Metam.* vii 338-878). Of this story no very convincing explanation has yet been put forward, perhaps Erysichthon may be explained as the personification of the labourer, who, by the systematic cultivation and tilling of the soil, endeavours to force the crops instead of allowing them to mature unmolested as in the good old times.

Demeter, however, was not limited to corn, but extended to vegetation generally and all the fruits of the earth, with the curious exception of the bean, the use of which was forbidden at Eleusis, and for the protection of which a special patron was invented. In this wider sense Demeter is akin to Gē, with whom she has several epithets in common, and is sometimes identified with Rhea-Cybele, thus Pindar speaks of Demeter χαλκρόχροα ("bronze-rustling"), an epithet obviously more suitable to Rhea-Cybele than Demeter (see CORYBANTES).

Another important aspect of Demeter was that of a divinity of the under-world, as such she is *χθονία* (earth-goddess) at Sparta and especially at Hermione in Argolis where, at the festival Chthonia, a cow (representing, according to Mannhardt, the spirit of vegetation), which voluntarily presented itself, was sacrificed by three old women. Those joining in the procession wore garlands of the flower called *haskanthos*. The remarkable epithets, *Ἐρπύς* (*ἁναικτ'*) and *Μελαρα* ("the black one"), as applied to Demeter, were both localized in Arcadia, the first at Telopeia (or

rather Onkeion close by), the second at Phigaleia (see W. Immerwahr, *Die Kulte und Mythen Arkadiens*, 1891). According to the Thelpusian story, Demeter, during her wanderings in search of Persephone, changed herself into a mare to avoid the persecution of Poseidon. The god, however, assumed the form of a stiltion, and the fruit of the union was a daughter of mystic name and the horse Arion or Arion (*q.v.*). Demeter, at first enraged, afterwards calmed down, and washed herself in the river Ladon by way of purification. An almost identical story was current in the neighbourhood of Tilphossa, a Bocotrin spring, and a similar one at Phigaleia, where, in a cave still called *Μαυροπέλυς* ("black cove"), there was an image of the goddess, a female form seated on a rock, but with a horse's head and mane, to which were attached snakes and other wild animals. It was clothed in a black garment reaching to the feet, and held in one hand a dolphin, in the other a dove.

Both *Μελαινα* and *έρων*, according to Farnell, are epithets of Demeter as an earth goddess of the under-world. The first has been explained as referring to the gloom of her abode, or the blackness of the withered corn. According to Farnell, the meaning of the epithet is to be looked for in the original conception of Erinyes, which was that of an earth-goddess akin to Gē, thus naturally associated with Demeter, rather than that of a wrathful avenging deity.

Various interpretations have been given of the horse-headed form of the Black Demeter: (1) that the horse was one of the forms of the corn-spirit in ancient Greece, (2) that it was an animal "devoted" to the chthonian goddesses, (3) that it is totemistic, (4) that the form was adopted from *Poseidon Hippios*, who is frequently associated with the earth-goddess and is said to have received the name *Hippios* first at Thelpusa, in order that Demeter might figure as the mother of Arion (for a discussion of the whole subject see Farnell, *Cults*, i, p. 502). In any case the association of Poseidon, representing the fertilizing element of moisture, with Demeter, who causes the plants and seeds to grow, is quite natural.

Demeter also appears as a goddess of health, of birth and of marriage, and a certain number of political and ethnic titles is assigned to her, the most important being *Ἀμφικτυονία*, at Anthela near Thermopylae, as patron goddess of the Amphictyonic league, subsequently so well known in connection with the temple at Delphi.

Brief mention may here be made of certain agrarian festivals held in honour of Demeter.

1 *Halōa*, obviously connected with *ἅλω* ("threshing floor"), begun at Athens and finished at Eleusis, where there was a threshing floor of Triptolemus, in the month Poseideon (December). This date, which is confirmed by historical and epigraphical evidence, seems inappropriate, and it is suggested (A. Mommsen, *Feste der Stadt Athen*, p. 365 *et seq.*) that the festival, originally held in autumn, was subsequently placed later, so as to synchronize with the winter Dionysia. Dionysus, as the god of vines, and (in a special procession) Poseidon *φωκάλιος* ("god of vegetation") were associated with Demeter. In addition to being a harvest festival, marked by the ordinary popular rejoicings, the *Halōa* had a religious character. The *ἄραχα* ("first fruits") were conveyed to Eleusis, where sacrifice was offered by a priest-ess, men being prohibited from undertaking the duty. A *τελετή* ("initiation ceremony") of women by a woman also took place at Eleusis, characterized by obscene jests and the use of phallic emblems. The sacramental meal on this occasion consisted of the produce of land and sea, certain things (pomegranates, honey, eggs) being forbidden for mystical reasons. Although the offerings at the festival were bloodless, the ceremony of the presentation of the *ἄραχα* was probably accompanied by animal sacrifice, Mommsen, however, considers the offerings to have been pastry imitations. Certain games (*πάριος ἀγών*), of which nothing is known, terminated the proceedings. In Roman imperial times the ephebi (*q.v.*) had to deliver a speech at the *Halōa*.

2 *Chloea* or *Chloia*, the festival of the corn beginning to sprout, held at Eleusis in the early spring (Anthesterion) in honour of Demeter Chloe, "the green," the goddess of growing

vegetation. This is to be distinguished from the later sacrifice of a ram to the same goddess on the 6th of the month Thargelion, probably intended as an act of propitiation. It has been identified with the *Procharistēria* (sometimes called *Proschoreteria*), an other spring festival, but this is doubtful. The scholiast on Pindar (*Ol.* ix. 150) mentions in Athenian harvest festival *Eucharistēria*. 3 *Proerosia*, at which prayers were offered for an abundant harvest, before the land was ploughed for sowing. It was also called *Proarktouria*, an indication that it was held before the rising of Arcturus. According to the traditional account, when Greece was threatened with famine, the Delphic oracle ordered first fruits to be brought to Athens from all parts of the country, which were to be offered by the Athenians to the goddess Deo on behalf of all the contributors. The most important part of the festival was the three sacred ploughings—the Athenian *ὑπὸ ῥόδῳ*, the Eleusian on the Rharan plow, and the Sorian (a corn promise between Athens and Eleusis). The festival itself took place, probably some time in September, at Eleusis. In later times the ephebi also took part in the *Proerosia*.

4 *Thalysia*, a thanksgiving festival, held in autumn after the harvest in the island of Cos (see Theocritus vii).

5 The name of Demeter is also associated with the *Skerophoria* (see ATHENA). It is considered probable that the festival was originally held in honour of Athena, but that the growing importance of the Eleusinia caused it to be attached to Demeter and Korē.

The attributes of Demeter are chiefly connected with her character as goddess of agriculture and vegetation—ears of corn, the poppy, the mystic basket (*kalathos*) filled with flowers, corn and fruit of all kinds, the pomegranate being especially common. Of animals, the pig is her favourite, owing to its productivity and the cathartic properties of its blood. As a chthonian divinity she is accompanied by a snake, the myrtle, asphodel and narcissus (which Persephone was gathering when carried off by Hades) also are sacred to her.

In Greek art, Demeter resembles Hera, but she is more maternally and of milder expression, her form is broader and fuller. She is sometimes riding in a chariot drawn by horses or dragons, sometimes walking, sometimes seated upon a throne, alone or with her daughter. The Demeter of Cnidus in the British Museum, of the school of Praxiteles, apparently shows her mourning the loss of her daughter.

The Italians identified Demeter with their own Ceres (*q.v.*). BIBLIOGRAPHY.—Besides authorities cited in the text, see W. Mannhardt, *Mythologische Forschungen* (1884), J. E. Harrison, *Prolegomena to the Study of Greek Religion* (1903), Preller-Robert, *Griechische Mythologie*, 4th ed. 1, p. 742 *et seq.*, O. Gruppe, *Griechische Mythologie und Religionsgeschichte*, ii. (1907), and the classical dictionaries.

DEMETRIA, an obscure festival or rite of Demeter, probably Athenian, in which the participants beat each other with whips of twisted bark, a well-known fertility charm (Pollux i. 37, Hesych s.v. *μύροτρον*). Also a name given to the Attic *Dionysia* in compliment to Demetrius Poliorcetes (Plut., *Demetrius*, 12).

See Stengel in Pauly Wissowa, *Realencycl.* iv. 2764.

DEMETRIUS, king of Bactria, was the son of the Graeco-Bactrian king Euthydemus, for whom he negotiated a peace with Antiochus the Great in 206 (Polyb. xi. 34). Soon afterwards he crossed the Hindu Kush and began the invasion of India (Strabo vi. 516), he conquered the Punjab and the valley of the Indus down to the sea and to Gujarat. The city of Sangala, a town of the Kathaons in the Punjab (Arrian v. 22, 2 *et seq.*) he named after his father Euthydemus (Ptol. vi. 1. 46). That his power extended into Arachosia (Afghanistan) is proved by the name of a town Demetras near Kandahar (Isidor. Charac. 10, cf. Strabo vi. 516). On his coins he wears an elephant's skin with trunk and teeth on his head, on bronze coins, which have also an Indian legend in Kharosthi letters (see BACTRIA), he calls himself the unvanquished king (*Βασιλεύς ἀνίκητος Δαμητρίου*). One of his coins had already the square form used in India instead of the circular. Eventually he was defeated by the usurper Eucratides (*q.v.*), who meanwhile had risen to great power in Bactria. About

his death we know nothing, his young son Euthydemus II (known only from coins) can have ruled only a short time. (Eo M.)

DEMETRIUS I (337–283 B.C.), King of Macedonia, surnamed *Polorocetes* ("Besieger"), son of Antigonus Cyclops and Stratonice. In 321 he married Phila, daughter of Antipater. At the age of twenty-two he was left by his father to defend Syria against Ptolemy the son of Lagus, he was totally defeated near Gaza (312), but soon partially repaired his loss by a victory in the neighbourhood of Myus. After an unsuccessful expedition against Babylon, and several campaigns against Ptolemy on the coasts of Cilicia and Cyprus, Demetrius sailed with a fleet of 250 ships to Athens. He freed the city from the power of Cassander and Ptolemy, expelled the garrison which had been stationed there under Demetrius of Phalerum, and besieged and took Munychia (307). After these victories he was worshipped by the Athenians as a tutelary deity under the title of *Soter* ("Preserver"). In the campaign of 306 against Ptolemy he defeated Menelaus (the brother of Ptolemy) in Cyprus, and completely destroyed the naval power of Egypt.

Demetrius and his father then adopted the royal title, thereby (and by their coinage) claiming the whole of Alexander's empire. A joint expedition into Egypt, Demetrius in command of the fleet, was a failure. In 305 he endeavoured to punish the Rhodians for having deserted his cause, and his ingenuity in devising new instruments of siege, in his unsuccessful attempt to reduce the capital, gained him the appellation of *Polorocetes*. He returned to Greece to deal with Cassander again. After a riotous winter in which he even shocked Athens, he drove the Cassandrian party out of the Peloponnese, called a conference at the Isthmus, and re-organized Philip's League of Corinth, much on the same lines, except that it rested on democracies in the constituent states. It was to meet at the Great Games (6 times in 4 years), and to include tribes (*tribes*), i.e., peoples not organized into city states. Eventually Seleucus, Cassander and Lysimachus united to destroy Antigonus and his son. The hostile armies met at Ipsus in Phrygia (301). Antigonus was killed in the battle and Demetrius retired to Ephesus, defeated. Many enemies rose up against him, even the Athenians refused to admit him to their city. Demetrius ravaged the territory of Lysimachus, and effected a reconciliation with Seleucus who married his daughter. Demetrius gained possession of Athens then oppressed by the tyranny of Lachares. In the same year (294) he established himself on the throne of Macedonia by the murder of Alexander, son of Cassander, but, expelled by the combined forces of Pyrrhus, Ptolemy and Lysimachus, he passed into Asia where he was forsaken by his troops and surrendered to Seleucus. His son Antigonus offered all his possessions and even his own liberty to have his father set free but without avail. Demetrius died in 283 after a confinement of three years.

See Life by Plutarch, *Diod. Sic. xix, 22*, Wilamowitz-Moellendorf, *Antigonus von Korymbos, De Sanctis, Contributio alla storia Ateniese* in Beloch's *Studia di storia antica* (1893), Ferguson in Lehmann's *Beiträge z. alt. Gesch. (Klio)*, vol. v (1905), also authorities under MACEDONIAN EMPIRE.

DEMETRIUS II, son of Antigonus Gonatas, reigned from 239 to 229 B.C. He had already during his father's lifetime distinguished himself by defeating Alexander of Epirus at Derinda and so saving Macedonia (about 260). On his accession he had to face a coalition which the two great kingdoms usually rivalled, the Aetolians and Seleucids formed against the Macedonian power. He succeeded in dealing this coalition severe blows, routing Boetia from their alliance. The revolt on in Locris, which substituted a republican league for the monarchy, greatly weakened his position. Demetrius had also to defend Macedonia against the wild peoples of the north. A battle with the Dardanians ended in disaster. He did not heed the warnings leaving Philip, his young son, Christos, still a child. Formerly one of Demetrius' wife Stratonice, the daughter of the Seleucid king Antiochus I, Philba, the daughter of Alexander of Cyprus and Nicomachus, the widow of his cousin Alexander.

See Thirlwall *Hist. of Greece*, vol. vi (1817), Ad. Pichon *Griech. Gesch. d. v. 1861*, B. Niese *Griech. Gesch. d. v. 1891*, J. Beloch *Griech. Gesch.*, vol. ii (1904).

DEMETRIUS, the name of three kings of Syria.

DEMETRIUS I (d. 150 B.C.), surnamed *Soter*, was sent to Rome as a hostage during the reign of his father, Seleucus IV. Philopator, but after his father's death in 175 B.C. he escaped and seized the Syrian throne (162 B.C.) after murdering King Antiochus V. Eupator. He was called *Soter*, or Saviour, by the Babylonians, whom he delivered from the tyranny of the Median satrap, Timarchus, and is famous in Jewish history for his contests with the Maccabees. Demetrius fell in battle against the usurper, Alexander Balas, in 150 B.C.

DEMETRIUS II (d. 125 B.C.), surnamed *Nicator*, son of Demetrius I, fled to Crete after the death of his father, but about 147 B.C., with the help of Ptolemy VII, Philometor, king of Egypt, regained his father's throne. In 140 B.C. he marched against Mithridates, king of Parthia, but was held captive for ten years, regaining his throne about 129 B.C. on the death of his brother, Antiochus VII, who had usurped it. But he was hated for his cruelty, and during another civil war was defeated at Damascus, and killed near Tyre. His successor was his son, Antiochus VIII. Grypus.

DEMETRIUS III (d. 88 B.C.), called *Euergetes* and *Philometor*, was the son of Antiochus VIII. Grypus. By the assistance of Ptolemy VIII. Lathyrus, king of Egypt, he recovered part of his Syrian dominions from Antiochus X. Eusebes, and held his court at Damascus. In attempting to dethrone his brother, Philip Epiphanes, he was defeated by the Arabs and Parthians, and kept prisoner in Parthia by King Mithridates until his death.

DEMETRIUS, a Cynic philosopher, born at Sunium, who lived at Corinth and in Rome during the reigns of Caligula, Nero and Vespasian. He was an intimate friend of Thrasea Paeus and Seneca. He was equally impervious to the bribes of Caligula and the anger of Vespasian who banished him. He taught the logical conclusion of Cynicism in attaching no real importance to scientific data.

DEMETRIUS, a Greek sculptor of the early part of the 4th century B.C., who is said by ancient critics to have been notable for the life-like realism of his statues. His portrait of Pelliclus, a Corinthian general, was admired by Lucian. He was contrasted with Cresilas (q.v.), an idealizing sculptor of the generation before. Since, however, the peculiarities mentioned by Lucian do not appear in Greek portraits before the 3rd century B.C., and since the Greek art of the 4th century consistently idealizes, there would seem to be a difficulty to explain. The date of Demetrius is confirmed by inscriptions found on the Athenian Acropolis (P.G.).

DEMETRIUS DONSKOI ("OF THE DON") (1350–1389), grand duke of Vladimir and Moscow, son of the grand duke Ivan Ivanovich by his second consort Alexandra, was placed on the grand-ducal throne of Vladimir by the Tatar khan in 1362, and married the princess Eudoxia of Nizhny Novgorod in 1364. He built the Kremlin of Moscow and waged war with Michael, prince of Tver, for supremacy. Demetrius was generally successful. In 1371 he won over the khan by a personal visit to the Horde, and in 1372 he defeated the Lithuanian supporters of Tver at Lyubutsk. Demetrius then formed a league of all the Russian princes against the Tatars, and in 1380 encountered them on the plain of Kulikovo, between the rivers Nepryadava and Don, where he completely routed them, the grand khan Mamai perishing in his flight from the field. But now Toktamish, the deputy of Temerlane, organized a punitive expedition against Demetrius. Moscow was taken by treachery, and the Russian lands were again subdued by the Tatars (1381). Nevertheless, while compelled to submit to the Horde, Demetrius maintained his hegemony over Tver, Novgorod and the other recalcitrant Russian principalities, and even held his own against the Lithuanian grand dukes. Demetrius was one of the greatest of the north Russian grand dukes. He was not merely a cautious and tactful statesman, but also a valiant and capable captain, in striking contrast to most of the princes of his house.

See Serguei Soloviev, *History of Russia* (Rus.), vols. 1–4 (St. Petersburg, 1857), etc., Nikolai Savelev, *Demetrius Ivanovich Donskoi* (Rus.) (Moscow, 1817).

DEMETRIUS PHALEREUS (c. 345-283 B.C.), Attic orator, statesman and philosopher, born at Phalerum, was a pupil of Theophrastus and an adherent of the Peripatetic school. He governed the city of Athens as representative of Cassander (q.v.) for ten years from 317. On the restoration of the old democracy by Demetrius Poliorcetes, he was condemned to death and obliged to leave the city. He escaped to Egypt, where he was protected by Ptolemy Lagos, to whom he is said to have suggested the foundation of the Alexandrian library. Having incurred the displeasure of Lagos's successor Philadelphus, Demetrius was banished to Upper Egypt, where he died (according to some, voluntarily) from the bite of an asp. Demetrius composed a large number of works on poetry, history, politics, rhetoric and accounts of embassies, all of which are lost.

The treatise *De Regenda* (on rhetorical expression), which is often ascribed to him, is probably the work of a later Alexandrian (1st century A.D.) of the same name, it has been edited by L. Radermacher (1901) and W. Rhys Roberts (1902), the last named providing English translation, introduction, notes, glossary and complete bibliography. Fragments in C. M. Leake, *Hist. Graec. vi* p. 362. See A. Holm, *History of Greece* (Eng. trans.), iv, 60.

DEMETRIUS, PSEUDO- (or FALSE), the name by which three Muscovite princes and pretenders, who claimed to be Demetrius, son of Ivan the Terrible, are known in history. The real Demetrius had been murdered, while still a child, in 1591, at Uglich, his widowed mother's appanage.

In the reign of Tsar Boris Godunov (1598-1605), the first of these pretenders, whose real name seems to have been Yuri or Gregory, first appears in history circa 1600, when his learning and assurance impressed the Muscovite patriarch Job. Tsar Boris, however, ordered him to be seized and examined, whereupon he fled to Prince Constantine Ostrozhsky at Ostrog, and subsequently entered the service of another Lithuanian, Prince Wisniwiecki, who tried to enlist the sympathy of the Polish king, Sigismund III, in his favour. The king refused to support him officially, but his cause was taken up by the Polish magnate Yuri Muszkiecki, whose daughter Marina he afterwards married. The Jesuits also seem to have believed in the man, who was evidently an unconscious impostor brought up from his youth to believe that he was the real Demetrius. Finally he set out, at the head of an army of Polish and Lithuanian volunteers, Cossacks and Muscovite fugitives, to drive out the Godunovs, after having received into the Church of Rome. At the beginning of 1604 Sigismund presented him at Cracow to the papal nuncio Rangoni. His public conversion took place on April 17. In October the false Demetrius crossed the Russian frontier, and shortly afterwards routed a large Muscovite army beneath the walls of Novgorod-Seversk. After the sudden death of Tsar Boris (April 13, 1605) the principal Russian army, under P. E. Basmanov, at once went over to him (May 7), on June 20 he made his triumphal entry into Moscow, and on July 21 he was crowned tsar by a new patriarch, the Greek Isidore. He at once proceeded to introduce a whole series of political and economic reforms. He did his best to relieve the burdens of the peasantry, he formed the project of a grand alliance between the emperor, the pope, Venice, Poland and Muscovy against the Turk, and he displayed an amazing toleration in religious matters which made people suspect that he was a crypto-Arian. But his assumption of the title of emperor, and his predilection for Western civilization, alarmed the ultra-conservative boyars (the people were always on his side), and a conspiracy was formed against him, headed by Basil Shusky, whose life he had saved a few months previously. On May 8, 1606, when Demetrius was married to Marina Muszkiecki, the boyars urged the citizens to rise against the Poles who had accompanied Marina to Moscow, while they themselves attacked and slew Demetrius in the Kremlin on the night of May 17.

See Sergey Soloviev, *History of Russia* (Rus.), vol. viii (St Petersburg, 1857, etc.), Nikolai Kostomarov, *Historical Monographs* (Rus.) vols. iv-vi (St Petersburg, 1863, etc.), Orest Levitsky, *The First False Demetrius or the Propaganda of Catholicism in Russia* (Rus.) (St Petersburg, 1886), Paul Pierling, *Rome et Demetrius* (Paris, 1878), R. N. Bain, "Poland and Russia," *Cambridge Hist.*, chap. 10 (Cambridge, 1907).

2 The second pretender, called "the thief of Tushino," first appeared on the scene circa 1607 at Starodub. He is supposed to have been either a priest's son or a converted Jew, and was well educated. He pretended at first to be the Muscovite boyar Nagai, but confessed, under torture, that he was Demetrius Ivanovich, whereupon he was taken at his word and joined by thousands of Cossacks, Poles and Muscovites. He captured Karachev, Bransk and other towns, was reinforced by the Poles, and in the spring of 1608 advanced upon Moscow, routing the army of Tsar Basil Shusky, at Bolkov, on his way. He entrenched him self at the village of Tushino, 12 versts from the capital, which he converted into an armed camp. In the course of the year he captured Marina Muszkiecki, who acknowledged him to be her husband (subsequently quelling her conscience by privately marrying this impostor who in no way resembled her first husband), and brought him the support of the Lithuanian magnates Muszkiecki and Sapieha so that his forces soon exceeded 100,000 men. He raised the rank of patriarch another captive, Philaret Romanov, and won over the towns of Yaroslavl, Kostroma, Volgograd, Kashin and other places to his allegiance. But subsequent disasters, and the arrival of King Sigismund III, induced him to fly his camp disguised as a peasant and go to Kostroma, where Marina joined him and he lived once more in regal state. He also made another but unsuccessful attack on Moscow, and, supported by the Don Cossacks, recovered a hold over all south eastern Russia. He was killed, while half drunk, on Dec. 11, 1610, by a Tatar whom he had flattered.

See Sergey Soloviev, *History of Russia* (Rus.), vol. viii (St Petersburg, 1857, etc.).

3 The third, a more enigmatical person than his predecessors, supposed to have been a deacon called Siderka, appeared suddenly, "from behind the river Yanza," in the Ingrian town of Ivangorod (Narva), proclaiming himself the tsarevich Demetrius Ivanovich, on March 28, 1611. The Cossacks, ravaging the environs of Moscow, acknowledged him as tsar on March 2, 1612, and under threat of vengeance in case of non compliance, the gentry of Pskov also kissed the cross to "the thief of Pskov," as he was usually nicknamed. On May 18, 1612, he fled from Pskov, was seized and delivered up to the authorities at Moscow, and there executed.

See Sergey Soloviev, *History of Russia* (Rus.), vol. viii (St Petersburg, 1857, etc.).

DEMIDOV, the name of a famous Russian family, founded by Nikita Demidov (b. c. 1665), who was originally a blacksmith serf. He made his fortune by his skill in the manufacture of weapons, and established an iron foundry for the Government. Peter the Great, with whom he was a favourite, ennobled him in 1720. His son, Akimiy Demidov (d. c. 1740), increased his inherited wealth by the discovery and working of gold, silver and copper mines. The latter's nephew, Paul Grigoryevich Demidov (1738-1821), was a great traveller who was a benefactor of Russian scientific education, he founded an annual prize for Russian literature, awarded by the Academy of Sciences. Paul's nephew, Count Nikolai Nikitich Demidov (1774-1828), raised and commanded a regiment to oppose Napoleon's invasion, and carried on the accumulation of the family wealth from mining, he contributed liberally to the erection of four bridges in St Petersburg, and to scientific education in Moscow. Paul's son, Prince Anatoli Demidov (1813-1870), was a well-known traveller and patron of art, he married Princess Mathilde, daughter of Jerome Bonaparte.

DEMIJOHN, a glass bottle or jar with a large round body and narrow neck, encased in wicker-work and provided with handles. The word is also used of an earthenware jar, similarly covered with wicker. The capacity of a demijohn varies from two to twelve gallons, but the common size contains five gallons. According to the *New English Dictionary* the word is an adaptation of a French *Dame Jeanne*, or Dame Jane, an application of a personal name to an object which is not uncommon.

DEMING, an incorporated town of south-western New Mexico, U.S.A., in the Mimbres valley, 35m from the Mexican border, at an altitude of 4,332 ft., the county seat of Luna county.

It is on federal highways 70, 80 and 260, is served by the Santa Fe and Southern Pacific railways and has a municipal airport. Pop was 5,667 in 1930 and 3,668 in 1940. Farming by irrigation, cattle grazing, and mining of copper, manganese, fluorspar and zinc constitute the chief industries of the region. Near by are medicinal springs, and 40 mi. N. of the city is the Gila National forest, in which is the Gila Cliff Dwellings National monument.

DEMISE, an Anglo-French legal term for a transfer of an estate, especially by lease (see **LANDLORD AND TENANT**). The phrase "demise of the Crown" is used in English law to signify the immediate transfer of the sovereignty, with all its attributes and prerogatives, to the successor without any interregnum in accordance with the maxim "the king never dies." At common law the death of the sovereign *de facto* dissolved parliament, but this was abolished by the Representation of the People Act, 1867, s. 51. Similarly the common law doctrine that all offices held under the Crown determined at its demise has been negated by the Demise of the Crown Act, 1901.

DEMISEMIQUAVER, in music, a note of the duration of half a semiquaver, a quarter of a quaver, and so on, represented as follows:  In the German nomenclature, which, in English

equivalents, is also that employed in the United States, it is known as a *Zweundrestrigstel*, or two-and-thirtieth note, being, as it is, a thirty-second part of a semibreve.

DEMOURGE (dē-mūr-j) (Gr. *dēmourgos*, artisan or handicraftsman). In Homer it includes hand-workers and heralds and physicians. In Attica the *dēmourgos* formed one of the three classes, with the Eupatridae (q.v.) and the *geōmoroi*, into which the early population was divided. (See **EUPATRIDAE**.) The word was used in the Peloponnese, with the exception of Sparta, for a higher magistrate. The *dēmourgos* represented Elis and Mantinea at the treaty of peace between Athens, Argos, Elis, and Mantinea in 420 B.C. (Thuc. v. 47). In the Achaean League (q.v.) the name is given to ten officers who presided over the assembly, and Corinth sent *Epidemourgos* to Potidaea.

In Plato *dēmourgos* is the name given to the "creator of the world" (*Timaeus*, 40) and the word was so adopted by the Gnostics. (See **GNOSTICISM**.)

DEMMIN, town in the *Land* of Prussia, Germany, on the navigable river Peene, 72 mi. WNW of Stettin, on the Berlin-Stralsund railway. Pop. (1939) 15,745. It has manufactures of textiles, and an active trade in corn and live stock.

An ancient Slav town, it was important under Charlemagne. It was besieged by a German army in 1148, and captured by Henry the Lion in 1164. In the Thirty Years' War Demmin was the object of frequent conflicts, and even after the Peace of Westphalia was taken and retaken in the contest between the electoral prince and the Swedes. It passed to Prussia in 1720, and its fortifications were dismantled in 1759.

DEMOCHARES (c. 355-275 B.C.), nephew of Demos, helen Athenian orator and statesman, was one of the few distinguished Athenians in the period of decline. He is first heard of in 372, when he spoke in vain against the surrender of Demosthenes, and the other at a Macedonian orator demanded by Antipater. During the next fifteen years he probably lived in exile. On the restoration of the democracy by Demetrius Phloretus in 337 he occupied a prominent position but was banished in 330, for having introduced the decree of Stratoleus, which contained a fulsome eulogy of Demetrius. He was recalled in 308 and during the next four years for food and equipped the city with provisions and ammunition. In 296 (or 297) he was again banished for having concluded an alliance with the Boeotians, and did not return until 287 (or 286). According to Cicero (*Brutus*, 83) Demochares was the author of a history of his own time, written in an oratorical rather than a historical style. As a speaker he was noted for his freedom of language (*Parrhesiasticus Seneca De ira*, iii. 23). He was violently attacked by Timotheus, but found a strenuous defender in Polybius. (xiii. 131.)

See also Plutarch *Demosthenes*, 30, *Demetrius*, 22, 4; also *Plutarch De ira*, iii. 23; J. G. Droysen *Antiquities of Demochares*, in *Zeitschrift für die Wissenschaften* (1856), Nov. 20, 21.

DEMOCRACY *Historical Development*—Democracy is a form of government based upon self rule of the people and in modern times upon freely elected representative institutions and an executive responsible to the people, and a way of life based upon the fundamental assumption of the equality of all individuals and of their equal right to life, liberty (including the liberty of thought and expression), and the pursuit of happiness. Democracy has a long and ancient history, and may be regarded as the modern fruit of western civilization and of its two component elements, the Athenian and Roman legacy and the Judeo-Christian tradition. The word is derived from the Greek *δημοκρατία* from *δῆμος*, the people, and *κράτος*, rule. In his *Politics* Aristotle, critical of the decaying Athenian democracy, regarded it in one passage (Bk. iii, chap. 7, 1279b) as a perfected form of that state where the citizens at large govern, because democracy considers only the poor and not the common good. In Bk. iv, chap. 4 (1290b, 1291b), he expressed his opinion differently: "We should rather say, that a democracy is when the supreme power is in the hands of the freemen, . . . a democracy is a state where the freemen and the poor, being the majority, are invested with the power of the state." And "The most pure democracy is that which is so called principally from that equality which prevails in it. For this is what the law in that state directs, that the poor shall be in no greater subjection than the rich, nor that the supreme power shall be lodged with either of these, but that both shall share it. For if liberty and equality, as some persons suppose, are chiefly to be found in a democracy, it must be so by every department of government being alike open to all, but as the people are the majority, and what they vote is law, it follows that such a state must be a democracy."

Democracy was widespread in ancient Greece. Greek history in its most developed period may be regarded as a struggle between democratic and oligarchic states, of which Athens and Sparta were the most representative examples. The Athenians were the first people to try, in their empire, to form a democratic empire, not merely one possessed by a sovereign people but one bound together by common democratic constitutions and institutions. This experiment failed because, as a result of the nature of the ancient city-state, the franchise of Athenian citizens was not extended, as later in Rome, to men of non-Athenian descent. But ancient democracy was in several ways fundamentally different from that of modern times. It was direct democracy in which the whole people formed the legislator and in which the representative system was unknown. That was made possible by the limited size of the ancient state which was generally confined to a city and its rural surroundings, and counted almost never more than 10,000 citizens. In the ancient democracies every citizen was entitled to attend the legislative meetings and to vote. A very large number of the citizens held one of the many elective offices in the course of the year. No division between legislative and executive branch existed, both were in the hands of the whole active citizenry; there was no modern party organization. The inability of the ancients to develop a representative system made it impossible for them to create large democratic states. On the other hand, the political life in the ancient democracies was most intense and all citizens were actively interested in and highly conversant with all details of administration. Direct democracy of this kind was the ideal most envisaged by Jean Jacques Rousseau in his *Contrat social*, and it may be found to a certain extent, in the New England town meetings and in some of the smaller Swiss cantons. The referendum and the popular initiative preserved in several modern democratic constitutions, as in that of Switzerland, can be regarded as elements of direct democracy surviving in the indirect or representative democracy, which is the generally accepted form of modern times.

Another and very important difference between ancient Greek democracy and modern democracy does not concern the form of government but the fundamental assumption of the equality of all individuals. Ancient democracy was not only compatible with slavery, it presupposed slavery, and it also permitted the necessary leisure for the citizens to devote themselves to questions

of public interest. Modern democracy has tended more and more to abolish all differences and privileges of birth, class, race and sex, and to broaden its basis so as to become all inclusive. The ancients had a very low estimate of labour, even of highly skilled labour, which also was performed by slaves. This attitude prevailed for a long time and characterized many feudal and post feudal societies. Only modern industrial civilization, which arose in countries where simultaneously modern democracy developed, produced the new concept of the dignity of labour which helped to break down the barriers of privilege. It should be noted, however, that in Athens slaves were very well treated, and that the main difference between their ways of life and those of other citizens of the poorer classes was the lack of political rights. The Stoic philosophy which dominated the Roman empire and pervaded Roman law, and the emphasis put by prophetic Judaism and early Christianity on the poor and the disinherited and on the equality of all men before God, created the fundamental assumptions on which democracy could develop its faith in the essential equality of all human beings.

The middle ages were not a favourable soil for the functioning of democracy, but toward the end of that period the growing power and wealth of the cities, especially in northern Italy, provided the opportunity for a more intense cultural and social life and with it the reappearance of the spirit of liberty. It is not worthy that Niccolò Machiavelli in his *Discorsi sopra la prima decada di Tito Livio* reached the value of liberty and the superiority of republics over monarchies or tyrannies. He emphasized the fact that the common weal is observed and promoted nowhere except in republics with a free citizenry (Bk. II, chap. 2, see also Bk. I, chap. 10.) These discourses contain a remarkable plea for democracy, assert that the people are wiser and more constant than a prince, and reject the contrary opinion, adding that this contrary opinion has its origin in the fact that everyone can speak ill of the people, freely and without fear, even while the people rule, while everyone speaks of the princes only with a thousand fears and a thousand considerations (Bk. I, chap. 58.) While the immediate effect of the Renaissance and the Reformation was to strengthen the power of the state and of kings, in the long run they helped to prepare the soil for the growth of democracy through their emphasis on the individual and individual conscience. A new spirit of inquiry grew up, spurred on by the new discoveries and inventions, it raised man's stature in his own eyes and opened before him vast and unknown possibilities. This new spirit found its expression in Francis Bacon's experimental philosophy as well as in René Descartes's rationalism which proclaimed in his "I think, therefore I am," the sovereignty and maturity of the thinking individual.

It was a long and hard struggle which from 1640 to 1918 carried democracy to world-wide victory. Through a number of great revolutions, but even more through the unceasing toil, the unsparring efforts and the spiritual devotion of countless individuals in many countries during these three centuries, the ideas of liberty and equality gained more and more concrete form. Seventeenth-century England may be regarded as the birthplace of modern democracy. Christian and classical traditions could grow

it being thus manifest that the power of kings and magistrates is nothing else, but what is only derivative, transferred and committed to them in trust from the people, to the common good of them all" (*Defense of the People of England*). Milton identified the English people and their cause with that of individual liberty, freedom of conscience, and the dignity of reason, but this new dispensation was to be universal, the English only preceding other nations, who were soon to follow. Macaulay in his *Essay on Milton* characterized the man and his epoch.

"He lived at one of the most memorable crises in the history of mankind, at the very crisis of the great conflict between liberty and despotism, reason and prejudice. That great battle was fought for no single generation, for no single land. The destinies of the human race were staked on the same issue with the freedom of the English people. Then were first proclaimed those mighty principles which have since worked their way into the depths of the American forests, which have aroused Greece from the slavery and degradation of two thousand years, and which have kindled an unquenchable fire in the hearts of the oppressed and loosed the knees of the oppressors with an unwonted fear."

The spirit of liberalism, rationalism and optimism pervading 17th century England found its lasting expression in John Locke's *Letters on Toleration* and *Two Treatises of Government*. Locke was greatly influenced by the writings of Thomas Hooker who, writing in the spirit of medieval scholasticism, carried over the basic political doctrines of Thomas Aquinas. Locke's works were dominated by the spirit of compromise, the "live and let live" attitude of mutual respect and toleration within the common frame, which characterized liberalism and democracy. Locke formulated and expounded two basic principles: that the individual, his liberty, dignity and happiness form the foundation of all social life, and that government is a moral trust dependent upon the free consent of the governed. As a result of the two revolutions of the 17th century, England was the only country in which the power of absolutism was definitely broken, and though democracy's growth was slow, its basis had been so firmly established that England never knew any retrogression. The control of national affairs had passed into the hands of a parliament with a steadily growing preponderance of the house of commons and a steadily enlarging electorate, the liberties of the community and of the individuals were protected by a Bill of Rights, judges had become independent from the executive power, the abolition of censorship and the recognition of tolerance became acknowledged principles.

From these roots the tree of democracy grew faster in the virgin soil of the American colonies than in the mother country. Locke became "America's philosopher par excellence." The colonists struggled with the mother country as Englishmen and on the basis of their freedom as Englishmen. What was a constitutional conflict within a common heritage of 17th century liberty became the starting point for a new surge of democracy, not only as a result of the peculiar social conditions of the colonies and the absence of the classes and institutions surviving from a feudal past, but also from the influence of the new ideas of natural rights, the rule of reason, and the freedom of man, which were expressed in the pamphlets "*Common Sense*" and "*The Crisis*" of an Englishman, Thomas Paine, and which were propagated in France by the Encyclopaedists and especially by Jean Jacques Rousseau. Their spokesman in America was Thomas Jefferson who had drafted the Declaration of Independence and whose life work in the later years was to convert the United States into a democracy under the influence of the 18th century ideas. This ideological foundation, started in the American Revolution, was carried on and expanded in the three following great conflicts through which the United States passed—in the Civil War under Abraham Lincoln, in World War I under Woodrow Wilson, and in World War II under Franklin Roosevelt.

Meanwhile the American Revolution, deeply influenced by the "French ideas," in turn acted upon developments in France. French society idealized the events across the Atlantic. It saw in them the first example of a people which in its eagerness for liberty and justice had thrown off the yoke of an unjust monarchy, and had established a government based upon the enlightened principles of reason. Soon the French people were to find them-

and to argue freely according to conscience, above all liberties, (*Areopagitica*), was matched by his declaration that "no man who knows ought can be so stupid to deny that all men naturally were born free, being the image and resemblance of God himself

selves involved in a similar effort. Years of unprecedented turmoil shook not only the foundations of French society, but also those of all Europe. The French Revolution introduced the symbols of a new cult of liberty and human rights and coined the three words which expressed the essence of the new faith of democracy: the liberty of every individual, the equality of all men, and the brotherhood of all human beings. In the immense enthusiasm of its beginnings, age-old privileges were abandoned, the new feeling of the dignity of man, of his right to self-expression and self-determination, not only created new political forms but manifested itself in all fields of public and private life. The armies of the French Revolution and of Napoleon carried the new spirit all over Europe, everywhere awakening the masses from their age-old lethargy and arousing in them the will to creative participation in the political, social and cultural fields.

Though the new ideas of liberalism and democracy seemed defeated in 1814 and Europe was apparently returning to the old order of authoritarian regime, of inequality and privilege, democracy was soon to resume its growth. In the century from 1820 to 1920 it gained both in depth and in breadth. The revolution of 1830, which started in Paris in July and ended in 1832 with the English Reform bill, re-established the trend toward constitutional government with guarantees for the rights and liberties of every citizen. Its invigorating influence made itself felt in 1848, the "spring of the peoples." The new ideas penetrated into central Europe and Russia, and finally, at the beginning of the 20th century started to transform traditional life even in the Ottoman empire and in Persia, in China and in Japan. World War I was really a democratic world revolution, in which the conservative monarchies of central and eastern Europe crumbled and gave way to democratic republics, suffrage became general everywhere, and the working class began for the first time to assume the responsibilities of government. So great was the impetus which World War I gave to the development of democracy that in most nations even women received the right to vote. This democratic wave did not stop at the confines of Europe. World War I had stirred the masses of the oriental and backward countries into previously unknown demands for national self-determination and for individual rights. The victory of the democratic states of western Europe and of the United States of America over the military and conservative monarchies of central Europe, and the Russian revolution of March 1917 marked, up to that date, the highest points of development for democracy. At that time democracy for the first time seemed to fulfil its world-wide mission of a liberating message to all classes and to all peoples.

For democracy is not only a form of government, but also carries definite implications in the economic field. In their rise, liberalism and democracy were connected with the ascendancy of the middle classes and with the growth of industrial civilization. As social phenomena, the English revolutions of the 17th century, the American and the French revolutions of the 18th century, and the revolutions of 1830 and 1848 were largely middle class movements. Economically they served the fight against a feudal and rural economy to provide the necessary liberty of development for the rising urban economy of traders and industrialists. This new economy was based on essential liberties removing all the restrictions of the past which had hindered the free development of the individual and had kept him in stations of life to which he had been assigned by birth or tradition. All these movements had also their more radical wings which insisted, beyond individual liberty and equality before the law, upon equality of opportunity and sometimes even equality of income. Though little was accomplished in the field of "economic democracy" in these revolutions, and in most cases the problem was neither seen nor understood, the rise of democracy with its emphasis upon equality and upon each individual's right to the pursuit of happiness awakened the masses to the realization of their situation, and brought many members of the upper and middle classes to the conviction that the benefits and blessings of democracy must be extended to the economic field to become real and effective for the masses. Complaints about the shortcomings of purely political democracy were frequent at the beginning of

the 19th century. Thus the *Mechanics Free Press* in Philadelphia declared in 1829: "There appear to exist two distinct classes, the rich and the poor, the oppressor and the oppressed, those that live by their own labors and they that live by the labor of others, the aristocratic and the democratic." The aspirations for a broadening of democracy to the economic field received a growing impetus throughout the 19th century with the progress of industrialization and of urbanization. The socialist movements in the 1830s and 1840s in France culminated in the formulation of socialist demands in the *Communist Manifesto* of Karl Marx and Friedrich Engels in 1848. It maintained that the "bourgeois" society could not develop a true democracy because it remained based on the exploitation of the wage earners by the capitalists. Some years before, the Chartists in England had tried to formulate a program of complete democracy without putting any emphasis, however, upon economic demands, confident that general and equal suffrage, annual elections to parliament, indemnities to parliamentarians and other means of making the elected representation correspond as closely as possible to the popular will, would result in economic democracy. Modern socialist movements, however, believed that political means alone were not sufficient and that economic measures were necessary. As such a measure, Henry George urged in his *Progress and Poverty* the introduction of the single tax to absorb the unearned increment in land values. Though important measures have been taken in most countries after the latter part of the 19th century to democratize the economic setup and to make the economically weaker classes participate more fully in social security and in the amenities of life, nevertheless economic democracy is still far from realization.

Ultimately, democracy in its political and economic expressions will always be determined by its strength as a moral and spiritual factor dominating the public mind. Great democratic statesmen like William Ewart Gladstone in England, or great democratic popular leaders like Giuseppe Mazzini in Italy have always understood how to instill some of their own democratic fervour and moral conviction in their people and thus to keep democracy as a live issue. For democracy does not exhaust itself in political techniques or in economic reforms. It is above all a fundamental attitude, a scale of values, a definite conception of man and his place in society. Though the institutions and forms of democracy may differ widely, and in fact do so in the various countries, there are central values which underlie all forms of democracy and determine what may be called the "democratic way of life." These values have been discussed above in the historical development. Here it is only necessary to point out what may be called the method of democracy. It is the method of discussion, of open-minded critical inquiry, and finally and frequently of compromise. Democracy presupposes the existence of opposition as a legitimate partner in the democratic process, it accepts a pluralistic view of values and associations, and it rejects any totalitarian or monolithic identification of the state with one party or with one dogma. But discussion and tolerance must always be held within the framework of the democratic faith, and that means the recognition of the fundamental values of individual liberty and of the equality of all men. Tolerance toward elements which deny the fundamental assumptions of democracy and even its right to existence, would not only be theoretically inadmissible, but also practically most dangerous to the existence of democracy. Democracy has many shortcomings, some of which are inherent in its nature, they can and must be improved and modified by constant criticism and vigilant opposition, they should not be allowed to foster a spirit of unproductive criticism which in its wish to put something "better" in the place of its "inefficiency" or "corruption" or "mediocrity" generally is not clear about the alternative which turns out to be some form of old authoritarianism or master-servant relation, however streamlined it may seem. By its own essence, democracy can never be perfect, because that would presuppose a perfect citizenry, highly educated and never swayed by blind emotion or by inertia. But with all its imperfections, democracy is so far the most human and humane form devised by the growth of western civilization which

increases the dignity and the creative faculties of every individual. Its intrinsic imperfections make it the most difficult, most daring and most promising form of human organization.

With the awakening of the masses from apathy to activity, from immaturity to full stature, democracy creates a number of complex problems which have sometimes been summed up in slogans like "the revolt of the masses" or, applied to former colonial peoples, "the revolt of the east." With the broadening of education, which only a comparatively short time ago was confined to a tiny minority and today practically everywhere tends to include everyone, the level of education necessarily had to be lowered, though the gain on the whole has been immense, not only in the breadth of education imparted but also in its quality. Since their awakening from traditional inertia, the masses have been more easily swayed by emotions, the democratic process of the formation of a collective will is cumbersome and allows the full play of demagoguery and may, in times of emergency, weaken or confuse the national resolve. All these difficulties offered to some an excuse for discarding democracy and for returning to the domination of a selected group, a self-appointed elite, convinced of its divine grace mission over the "eternally immature" people. Faced by the complexities of modern life, some wished to take refuge in an apparent "security" by scrapping 300 years of social and intellectual development. Since World War I a number of movements of this kind have arisen, motivated partly by a conscious return to what Oswald Spengler has called "age old barbarism," an attitude long believed obsolete, partly by a sense of defeatism, of frustration, of discouraged cynicism. Democracy had lost its vigour to a certain extent, had become softened by a preoccupation with material progress and economic considerations. The attacks to which it found itself exposed re-vitalized democracy and brought about a rethinking of its fundamental values and implications. The difficulties inherent in democracy were realized, but they were understood as a challenge to which the right response was a deepening and broadening of a regenerating democracy.

The conditions of the 20th century, with its new means of communication and the fast-growing interdependence of all people on a shrinking earth, faced democracy with the problem which is inherent in its conception of human brotherhood that of establishing a democratic world order which would assure universal peace and the security of democracy in the different countries. The need had been foreseen by Immanuel Kant in his essay on *Perpetual Peace*, published in 1795 under the influence of the first great democratic revolutionary wave.

A state of peace among men who live side by side is not the natural state, which is rather to be described as a state of war. That is to say, although there is not perhaps always actual open hostility, yet there is a constant threatening that an outbreak may occur. Thus a state of peace must be established." Kant said that this peace was possible only if each state were what he called "republican," possessing representative institutions, and if the law of nations were founded on a federation of free states. "The intercourse, more or less close, which has been everywhere steadily increasing between the nations of the earth, has now extended so enormously that a violation of rights in one part of the world is felt all over it. Hence the idea of a cosmopolitan right is no fantastical, high-flown notion, but a complement of the unwritten code of law—constitutional as well as international law—necessary for the public rights of mankind in general and thus for the realization of perpetual peace." What Kant foresaw about 150 years ago, what was postulated by the democrats of 1848, became in the 20th century a matter for thoughtful consideration as a precondition for the survival of democracy anywhere. Woodrow Wilson, and with him many democrats in all democratic countries, felt the need and endeavoured to meet it by the creation of a League of Nations. Its close and fundamental connection with democracy was understood by Wilson. In his appeal for it he warned, "I think we all realize that the day has come when democracy is being put upon its final test." In the last address which he broadcast on Armistice Day, 1923, he repeated, "The faith of the world can be set straight only by the firmest and most determined exhibition of the will to lead and make the right prevail." The refusal of the democratic peoples to establish a firm international order, when the victory of 1918 gave them an opportunity, their unwillingness to shoulder responsibility for the common destiny of all nations, made possible World War II which began in 1939, in which democracy was faced with an unprecedented danger fraught with almost unimaginable consequences. This greatest and bloodiest of all wars came to a close in 1945 with the fall of Germany and Japan. Through the victory of Great Britain, Russia, the United States, and their allies, a second opportunity within the 20th century was given democratic and peace-loving nations to establish democracy more firmly in the other nations of the world and, through a new world organization, to render more secure the democratic order and international peace. A long period of post-war unsettlement provided many obstacles to the realization of these ideals.

Millions of people throughout the world faced starvation, hundreds

of thousands of displaced people sought unsuccessfully to return to their homes or to establish new homes in more stable surroundings. Suspicion among the Allied nations prevented the ready settlement of territorial disputes. Within all nations economic problems aggravated by the war brought an overpowering sense of insecurity. Democracy was confronted by another long period of trial.

Theory and Institutions—Considered as a form of government, democracy usually confronts modern thinkers under two separate aspects as democratic theory and as democratic institutions, and this division will be followed here. Even as a theory, however, it has undergone a series of developments from the earliest times. Philosophically, it has always suffered from the apparent paradox that under it the people are at the same time both the rulers and the ruled, and this, to many of the ancients, was rather a form of anarchy than of government. Hence Aristotle placed it in the lowest degree of legitimate governments, and the most likely to degenerate into tyranny. The modern concept of democracy, on the other hand, finally emerged as a result of the perennial search for the best and most equitable form of government. Largely as a result of the rediscovery of Aristotle himself, the Middle Ages summed up the qualities of good government under three headings: it must be rule for the common good, it must be representative of the community, and it must, in its authority, be immediately derived from the community. Still under the influence of Aristotle, however, the Middle Ages, preoccupied with the idea of unity, considered the monarchy—the rule of one—to be the best form, the one most suited to secure this unity. It is clear to us now, however, that this concept was valid only so long as the monarch was himself ruled by an interior criterion of goodness, and then only in theory. For while the absolute monarchies did not always change into tyrannies, nevertheless, in practice, and in the 15th century, in theory, as a result of the re-introduction of the

One, however, this point of reasoning had been reached, another, and graver, question had to be settled before a sound theory of democracy could be established. If the community was to govern itself, instead of being governed by some ruler or senate, then some justification would have to be found by which the community, or an agency set up by it, would possess the moral right to impose obligations upon the citizens as a whole. The writers of the Old and New Testaments, and the fathers of the church, assumed that the authority of the ruler was in fact the authority of God Himself. Those philosophers who followed Aristotle saw the origin of authority in the natural law

which amounted to the same thing, since the natural law was deemed to be merely the law of God as discovered in man's nature by human reason. On the other hand, the lawyers, following, Ulpin, held that all authority is derived immediately from the people, while admitting that ultimately it came from God the Creator. In the early Middle Ages, following Charlemagne, the authority of the ruler arose as a result of a contract between the ruler and the people, signified by a mutual exchange of oaths. In the 13th century, a synthesis was made of these various opinions, and the community was said to possess the authority from God through the natural law and to have transferred it by a contract to the ruler. There was still no question of the community normally exercising its own authority, though democracy was always considered in theory to be a legitimate form of government. Soon, however, a distinction made between a political regime and a legal regime, one in which either the people or the king was the source of law, opened the way to the rise of the absolute monarchies. Sir John Fortescue tells us in the 15th century that in his time the political regime survived only in England, while on the continent generally it was the legal regime that held sway. The influence of Machiavelli, with his rigid concept of the absolute rule, quite universally entered into political theory. In spite of the opposition of Richard Hooker, who looked to the older European tradition for his inspiration, England at last under the Tudors and then the Stuarts succumbed to the idea of the legal regime in an exaggerated form. It was Thomas Hobbes who made himself the philosophical protagonist of this theory. Meanwhile on the continent, a reaction against absolute rule had set in in Italy and Spain under Roberto Bellarmine and Francisco Suarez, and an attempt was made by these Jesuits to restore the mediaeval doctrine of a justification of political authority by seeking its immediate origin in the community itself. In England, in turn, the old Whigs, and the writers Algernon Sidney and John Locke (q.v.), both frankly basing their contentions on the older European tradition, sought the justification of authority in the compact by which a number of human wills concurrently seek the common good. The Scottish school of common sense, under Buchanan and Reid revived in Great Britain the older concept of the natural law, by which man,

bound by his own laws, and the *lex regia* of the old Roman law was interpreted in the Middle Ages to be the law by which the people set up a ruler and established the precise limits within which he could rule. We have here, moreover, the first germs of constitutional rule, which was later to become so important in democratic theory. This development, however, was temporarily retarded by the rise of the absolute monarchies, but as Lasca has observed, if it had been allowed to continue, it would have introduced democratic institutions much sooner in the history of western Europe. It remained for the American theorists to see the precise application of constitutionalism to self-government as the only external means to ensure that the ruler or government will be wholly devoted to the common good. According to these, it is the people who give the constitution, and the appointed ruling agency is held in its administration within the rigid limits of its letter, subject to the right of the people at any time, by appropriate means, to enlarge or restrict the powers which it has granted. In this theory, again, three things are done by a constitution: the requisite consent is granted by which a people constitutes a state, a form of government is chosen and set up, and to this government, the incumbents of which are later to be elected, certain rights are granted, and at the same time, definitely limited. Thus the ancient theory of the necessity of limitation of government within the consent of the people was made actually feasible by the democratic theory of a popular constitution. The example of the American colonists in adopting a constitution was followed in the French Revolution. On the other hand, in Great Britain, the claim is also made for a constitution, on the grounds that the commons, the ruling agency, is at any time restricted by the powers which, for the occasion, the people, through its representatives, are willing to grant. Thus, in that system, while the constitution is not written, it is nevertheless considered to exist as a definite limitation of power on the ruling agency.

Other limitations, however, had to be placed upon authority before a constitutional democracy could become possible. These, like the mediaeval one of justice in the ruler, are in the internal order, but, unlike the earlier limitations, they regard the community rather than the ruler. The principles of these are two: liberty and equality. Liberty, as a political idea, has always had to struggle between two opposing concepts of its meaning. The ancient idea, as expressed, for instance, by Aristotle, Augustine and Aquinas was that liberty is the right of the members of the community to be ruled in their own interest. This remained the controlling theoretical idea of liberty for many centuries, whatever the practice may have been at various times. Later, however, and especially after the Renaissance and Reformation, another idea came in to dispute this earlier concept. At

trained under the Scottish school, took the stand of an objective obligation to obey arising from man's own nature as a social and political animal, and the consequent placing of sovereignty in the people itself. In this they were abetted in England by Edmund Burke. It remained for George Washington, in his farewell address, to express this idea in a lapidary sentence: "The very idea of the right and power of the people to establish government presupposes the duty of every individual to obey the established government." This is the ancient doctrine of the essential correlation between rights and duties. It implies a mutual responsibility between state and individual in which man, by his nature as a social animal, seeks from the state perfection as a person, and the state in its turn seeks from the individual that co-operation by which it may contribute to the perfection of every other individual. It is this concept, as expressed by George Washington and others of his time, which give to the American its distinctive character for it solved once for all the problem of the moral right of the people as a sovereign to command the people's subject.

Equally important in the development of democratic theory is the evolving notion of the necessary limitations on political authority which are required if government is to realize its essential function of causing for the common good. In the early days of western civilization this limitation was purely internal and spiritual. The idea of the representative of God and the first of his creatures, the ruler, was contrary to the will of God, that is, nothing that God would not do if He were the direct ruler. This internal sanction was a powerful incentive as long as rulers voluntarily accepted the moral teaching of the church. It persisted, as a matter of history, only as long as the influence of churches on rulers. It was a mediaeval tradition that lasted even into the American colonies, particularly Massachusetts and Virginia. In the course of time it gradually became clear that some external sanction was necessary as well. Yet, while the need for limitation was clear, the visible means to this end were not so clearly discernible. The mediaeval contract between people and ruler was fairly efficient. In the hands of a man like Mansfield or Lautenbach it became in fact a powerful instrument for holding the ruler to his duties as a servant of the people, for by his defying of the contract, the ruler became, in this theory, no longer a king but a tyrant, and hence the people were by that very fact absolved from their allegiance to him and to his government. Outside of the impractical faculty, political writers quite generally held, with Isidore of Seville, that the ruler is

much-quoted dictum of Pope Gregory the Great (590-604), that "all men are by nature equal" was maintained as the universal teaching to many centuries. This quality, however, remained what may be called passive equality, it meant that originally all men without exception enjoyed liberty, the right to be ruled in their own interests. It was, therefore, essentially a conscientious limitation on the power of the ruler, and was achieved only when he accepted the obligations which it laid upon him. It did not formally include the right of the individual to participation in government itself. The axiom laid down by Aquinas in the 13th century that "all should have some share in the government" was new for his time and did not bear fruit for many centuries. It took long thought before western man actually saw the implications of his own teaching, and it was a teaching, of

end. This theory, however, it must be said, is not universally accepted in the United States, especially in the west, where the initiative, referendum and recall have entered into political thinking. Under this opinion, all public officials, even judges, must at any given moment merely register the existing will of the majority of the constituency. The partnership between people and representative, therefore, under this concept, is not one of principal and agent, but of a principal and his messenger, where the principal chooses the end and means.

This question concerning the function of the representative, moreover, involves another, namely, that of the rights of a majority in a democracy. Here the continental and Anglo-American theories are again in conflict. In the French Republic, for instance, under Gambetta and his followers, the majority acquired absolute rights through election, and it was expressly declared to be a derogation of the liberty of the majority to demand that account be taken of electoral minority demands. In the United States particularly this theory has always been considered to be an essential weakness of French publicanism, a weakness that has been reflected through French influence in many Latin American countries which have adopted democratic institutions. In the American theory, there is an implicit contract in the electorate before each balloting that the eventual minority shall abide by the results of the election, so that each election is a *fait accompli*, a unanimous one, since the whole constituency agrees to the choice of the winning candidate. The important result of this implicit contract is that after the election the representative, once elected, represents, not those who elected him as a majority, but his whole constituency, including the minority. The representative in the American system, the whole people, at any given moment, actually governs through its elected representative. It is this theory that has protected the democratic system of the United States from periodical revolutions engineered by discontented minorities which refuse to abide by the results of the balloting and have no other recourse to secure representation except by violence in their own interest.

A final question in democratic theory concerns the right of any people, even under an absolute ruler, to change its form of government. The right of revolution has been in at least a part of the tradition of western civilization since medieval times. The theory of contract between people and ruler implicitly involved the right of the citizen to free himself from a despot who violated his part of the contract by using to rule for the common good, in turning it to his own private and advantage. The medieval monarchs, such as the Saxon kings in Britain, were supposed to be bound by the laws of God and man, and the people, in the right which remained to them, were supposed to have the right to depose a ruler who violated his part of the contract. The right of revolution, since both the theory of government and the choice of an international order have been based upon the consent of the people, is a consequence of both. It is not the right of an individual to another, nor of one citizen to another, but the right of the community as a whole. It has been introduced as a result of the modern conception of democracy with a constitution of representative rights. Until this development a republic is equivalent to any individual political change which is not carried out according to constitutional provisions and violence in the course of such a change is particularly to be added. It is doubtful, however, if any democratic republic could come to such a change, no matter how justified it might be, without it ceasing to be a democracy. To be certain, a democratic government in a democracy is totalitarian, and it is not to be supposed that its members accept its existence and will tolerate its purposes of change only within the framework of this system. While it is true that a republic licensed to political party which determines its own rules, such a party would be possible but it is not constitutional in the United States, which guarantees a republic to its citizens and to its government even to its separate states. Here, then, the constitutional party is a definite problem, for while it calls for a revolution which would ultimately be actually transform our type of government into "authoritarianism" (of the state), it necessarily professes to do so in constitutional means and hence its intention to break the existing understanding. It may be true, however, that even a democracy cannot, or at least would not, tolerate a form of political fight on for nazism or for anarchy, which openly professes to intend to do away with democracy altogether.

Democratic Institutions.—The fundamental institution in every modern democracy is the constitution. Whether that constitution is written, as in the United States, and many other countries, or an unwritten one, as in Great Britain, such a constitution really performs three functions: it expresses the consent by which the people actually establish the state itself; it sets up a definite form of government; and it grants and at the same time limits the powers which the government is to possess. The British constitution which is the model part of an unwritten one, is really at the present time the sum total of the powers which, at any given time under the doctrine of the omnipotence of the parliament, the commons, as the direct representative of the people, consents itself to give to the government. It is in constant motion to turn. On the other hand a constitution of the type of a federal republic like the United States is the sum of enumerated powers of which the several sovereign states have divided themselves and which they have deposited in the central government. The several states

themselves have also adopted constitutions though it is generally held that, unlike the federal government, the state governments have all the powers which accompany sovereignty, whether they are enumerated in the constitutions or not except those which they have surrendered to the government in Washington. Other more centralized republics possess constitutions which are not composed of enumerated powers but which preserve certain general political principles and leave a wide latitude to the legislature and the executive.

The principal functions of any government are three: legislative, executive and judicial. The concrete political institutions in any given country, therefore, will be those which exercise those functions, and also those which contribute to these three. In ancient tradition, these functions were usually combined in the person of a king or the senate, and theoretically, they could also be combined in a democracy in one institution, provided that that institution were subjected to periodical accountability to the electorate, which, as we saw, is essential to any notion of self-government. In practice, however, such a concentration of power could hardly be called a democracy, though it could be called a representative government. All modern theories of government demand that the judiciary be separated from the executive who is entrusted with the administration of the laws. Democratic theory, moreover, which considers the power of passing laws to be the heart of any government, requires that the community as a whole be, as directly as possible, associated with the process of legislation. Separation of the legislature from the executive is not considered to be an essential of democracy as such. In modern political literature in English, which is usually created, we are not aware of the distinction between the three powers, though he himself was well aware that he was merely repeating the ancient Roman and medieval doctrine, while Montesquieu is probably the first who actually suggested their separation. This suggestion was followed out in the American constitution principally as a reaction against the confusion between the three powers which had taken place in the English parliament and which was the real cause of the grievances of the colonies. As a result, in the United States, the government, properly so called, is not the president nor the congress nor the court, but all three taken together. The president and his departments in the executive function are properly designated the administration.

The simplest form of a direct association of the people with the making of laws is that in which the whole community (usually actually not only chooses by vote the ends to be pursued, but actually chooses the means to achieve, this end and embodies them in laws, as in the case of the town meeting, where the people are present). This was entrusted to an elected official (baillif, sheriff, consul, etc.). Since, however, as has been said, this type of government is possible only when the population is so small that it can be present at the same time and place, and hence in larger communities the only practical means of giving the people control over legislation is by electing a body which is elected by the people, and which is small enough to meet at one time and place. The deliberations of such a body could thereupon be presented on each occasion to the community for its approval or rejection, or the representatives could be empowered to enact them into law immediately. It is thus that a parliamentary form of legislative body has by tradition and experience been identified in practice with democracy. Moreover, in a democracy, this parliament could also be entrusted with the execution of the laws, and this is the system which, with the rise of parliamentary supremacy, developed in Great Britain, where the executive, the cabinet, is merely a committee of the commons, and is chosen by the majority party, and also in most other democratic systems. In the United States, as in Britain, a bicameral body consists of a legislative branch, which, however, unlike Britain's system, is completely separated from the executive branch. Moreover, even in accord with the medieval tradition, the monarchical principle was deliberately preserved in the American system, and the executive of the laws was made one man, the president.

In all the various systems of representative government the obligation of periodical accountability to the electorate has been maintained, but in varying degrees. Most of a fixed limit of several years has been chosen, with the periodical election of the representatives of the people, with the intervening obligation imposed upon the cabinet, if it lost the confidence of the majority of parliament in a matter of importance, to resign, or go to the country for a new election, or both. Here again the American democratic system departed from precedent. The president is elected for four years, and is recallable only after impeachment and a trial before the senate presided over by the chief justice, with a two-thirds majority necessary to secure his removal. He is not, therefore, as in Britain, subject to a fluctuating congressional majority. In the congress, one-third of the senate is elected every two years, while the house of representatives is elected in its entirety every two years. It was hoped for a reason, that this overlapping recourse to the people would introduce a permanent quasi-automatic stability not present in other systems. In the same way, the conception of representation has also varied in different democratic systems. In Britain, in the third French republic, and in other regimes modeled upon them, the executive is directly responsible to the legislature since it is really only a part of the latter body, which is directly chosen by the people. In the original form of the American system the president was chosen by a body of electors, who had

free discretion as to whom they might choose, and hence he was not the immediate choice of the people. The senate also was not immediately chosen by the general electorate of the various states, but by the state legislatures, to whom, therefore, the senators were directly responsible. Only the lower house in the American system was to be elected by popular vote. In the case of the president, and largely as a result of rigid party control, the constitutional provision has been nullified, the electors have lost their discretionary powers, and hence for all practical purposes, he is elected by a direct popular vote. Popular election of the senate was introduced by the 17th amendment (adopted 1913). Only the federal judiciary, in the American system, is theoretically independent of the will of the community, though the popular philosopher, Dooley, has expressed the current opinion, that "the supreme court follows the election returns." Due to the fact also that the supreme court justices have been ordinarily appointed at a relatively advanced age, the president who is elected for two terms or more is in a position to appoint incumbents who more or less adhere to the policy of the contemporary majority party. The United States supreme court, however, has been noted for maintaining the civil rights of individual citizens, no matter what general social or economic philosophy its members profess.

Electoral systems in a democracy have also varied in different circumstances and lands, and at different times in the same land, in accord with varying theories of the nature and extent of representation itself. No electoral system, apparently, has included the whole population. At different times, the electorate has been considered either as an attribute of citizenship, a vested privilege, an abstract right, a function of government or a means of expressing human personality, but in general it can be said that the modern tendency has been to include as far as possible all the adult population in the number of those who are entitled to express their preference for their representatives. Moreover, with the abandonment of the earlier idea that the family is the essential unit of society, it was quite in accord with this tendency that the head of the family, the husband, should lose his unique prerogative, and so women suffrage was introduced in the United States by the 19th amendment (adopted 1920) and in its complete form by Great Britain in 1928. All electoral systems in early days, including the British and American, restricted the ballot to property owners and it was only gradually that universal adult suffrage has been adopted. Meanwhile, also, constant attempts at restriction have been practised. For many years, the "grandfather clause," excluding from the polls those whose grandfathers had been slaves, was a disqualification in southern states in the U.S.A., and at present writing (1942) the poll-tax restriction, by which the very poor (mostly Negroes) are excluded from voting and jury duty in a dozen states, is a matter of intense controversy. Other restrictions have to do with registration, with extended periods of domicile in the respective voting precincts, and other similar forms of exclusion through legal means. Intimidation of rural or industrial employees has also been widely resorted to. It has always been assumed that the electoral system should be free of all special influences, and hence that the free ballot necessarily means a secret ballot. In those countries in Europe and elsewhere with democratic regimes in which the political parties themselves supply the ballot outside the polling places, this secrecy has been necessarily absent. The United States system, in which local government itself prints and supplies the ballot or a voting machine, is probably the best way to secure secrecy. Many so called plebiscites which in totalitarian countries the ruling regimes have designed to give a colour of legitimacy to their revolutionary movements have lacked secrecy, and hence freedom

third parties would give the working classes a strong balance of power, since they would draw off to themselves the bulk of votes of both major parties. As has been said, in democratic countries only those parties can in theory be tolerated which accept the democratic regime, or if they wish to change it fundamentally, aim at doing so by constitutional means. There has, however, by tacit consent been no concerted movement to test this theory, probably because such parties (Action Française in France, Communist parties in Britain and America), have never reached such proportions at the polls as to constitute a serious menace to the existing status.

A final institutional characteristic of most democracies is equal educational opportunity. While universal popular education is a relatively new institution, even in democratic countries, including the United States, it is now generally admitted that at least elementary education should keep pace with the extension of the franchise. Since theoretically the ultimate source of political power in a democracy lies in public opinion, the ability to read has always been considered a necessary qualification of the citizens of a democracy. It has usually been held, therefore, that popular education in a democracy, at least of an elementary kind, should be made compulsory by law. The democracies, however, unlike the totalitarian states, have never presumed to dictate the content of the education to be given, and so insist that the schools are free.

Democracy as a Way of Life—Considered as a way of life, democracy is a subjective attitude by which the members of the community are led to secure to every one his rights, to look upon all fellow citizens without distinction of colour or race as brethren in a common enterprise, and to give spontaneous support to projects which enhance civic excellence and promote the general welfare. In this sense democracy approaches the "virtue" which the old philosophers and the Founding Fathers of America considered the principal characteristic of citizenship, and is akin to the medieval "justice" by which all members of the community were to co-operate by joint action to give each one his due. In this sense, therefore, democracy is not necessarily allied either with democratic theory or democratic institutions, but could exist under any form of government. It is, however, one of the more valid claims of democracy that only under it can these civic virtues flourish to their full extent, because only under democracy do there exist those institutions through which those virtues may exercise themselves. These institutions are a popular constitution, a parliament of some kind, universal suffrage and a disciplined party system. Through these an active equality of persons exists by which the individual citizen is associated with the process of authority. This equality places upon the individual that responsibility which in absolute systems is laid upon the ruler. The individual, therefore, as ruler, must himself possess and exercise all those virtues with which the ideal rules in all political literature has been endowed. In a sense, therefore, democracy professes a philosophy of life in somewhat the same way that the totalitarian systems of modern days profess one. In the latter, in this philosophy is a personal freedom from the dictatorship of intellect by which the total systems maintain themselves. In other words, freedom of conscience and freedom of expression are its necessary components. Along with these freedoms, is also included economic freedom, at least if by that term is understood freedom from dictation to the political process by purely economic forces, and a more nearly equal opportunity to the members of the community to acquire the goods of the earth. (W. P. J., X.)

DEMOCRATIC PARTY, founded by Thomas Jefferson, the third president, is the oldest continuously existing political instrumentality in the United States. Its original name was the Republican party and the day of its birth has been fixed as May 13, 1792. A letter of that date from Jefferson to George Washington made the first authoritative claim of a name for the party, of which Jefferson had become the recognized leader. Actually the seeds were sown in the Constitutional Convention of 1787, when the first battles were fought between Hamiltonian advocates of a strong, centralized federal government and Jeffersonians who wanted the least possible federal government consistent with national security and welfare. In accord with Jeffersonian philosophy there was eventually established a party which adopted the following political principles: direct popular control of government, wide extension of suffrage and the fullest measure of personal liberty consistent with law and order, opposition to sumptuary laws, strict interpretation of the constitution and preservation of the rights of the states, opposition to centralized power in the federal government, equal rights for all, religious liberty, free speech and a free press.

Although the new party was a strong opposition force in congress, it did not obtain control of the government until Jefferson became president in 1801. For 40 years thereafter, except in 1825-29, the Democratic party was in almost continuous control. After serving two terms, Jefferson was able to obtain the nominations and elections of James Madison and James Monroe, re-

has been customary in the United States. In some countries, for instance in Great Britain, the party secretaries in preparing lists of candidates to be presented, take care that in the total number of them are contained specific representatives of the various professions and branches of industry and commerce. Another type of functional representation has been proposed by some socialist groups in which regional constituencies would be abolished, and only professional and industrial groups would be represented in legislative bodies. In Great Britain for many years, and in the United States in some localities in recent years, labour parties have been created on the theory that such

spectively, as president Madison and Monroe, both close friends and disciples of Jefferson served a total of 16 years. This 40-year Democratic rule, which included the so-called "Era of Good Feeling," was interrupted only by the election of John Quincy Adams in 1824. Adams, who served one term, was in neither the Hamilton nor the Jefferson tradition but fought bitterly with both groups in congress. He was succeeded by Andrew Jackson in 1829. In 1840 the Democrats lost to the Whigs, but on the death of Pres. William Henry Harrison in 1841, John Tyler succeeded, and he became more of a Democrat than a Whig.

The Democrats regained control in 1844, lost in 1848, came back to power in 1852 and remained in office until the historic split on the problem of slavery in 1860, followed by the Civil War.

Although Jefferson had founded the party on the principle of popular and self government, as against the Hamilton idea of control by an economic and industrial oligarchy, the so-called Virginia school of presidents were aristocrats in birth, breeding, education and environment. It was not until the election in 1828 of Andrew Jackson, a backwoodsman and warrior from Tennessee, that a man of the people entered the White House as a Democrat, to become the second great figure in the party's annals. More than 20 years later, the Democrats' most important annual celebrations became known as Jefferson Jackson day dinners.

The Jeffersonians in effect held the party in trust for the people, whereas Jackson turned it over to them. Under him the people and the local politicians participated in public affairs and political councils. He organized the country's first political machine. One effect was introduction of the spoils system, under which federal office became a reward for activity on behalf of the party.

Jackson, a dominant and tempestuous figure, also brought the party back to Jefferson's original principles of strict interpretation of the constitution, a position which the sage of Monticello had found it necessary to abandon, notably in the purchase of Louisiana. Jackson's two great battles, which he won, were to abolish the second United States bank and to crush the defiance of the federal government by South Carolina. That state, under the leadership of Jackson's archrival, John C. Calhoun, showed its resentment against the 1828 "tariff of abominations" and a slightly modified 1832 version of the same bill by threatening to nullify this legislation and, if necessary, to secede. Jackson's Nullification proclamation, which ranks as a great state paper, proclaimed that no state had a right to withdraw from the federal union, and was a forerunner of Abraham Lincoln's similar declaration in 1861. It was during Jackson's campaigns that his followers began to call themselves Democrats, and the name was in general use in his second term.

Between 1837, when Jackson retired as an enfeebled but heroic figure, and 1860, there were four Democratic presidents whom history generally regards as mediocre—Martin Van Buren, James K. Polk, the first "dark horse" in US politics, Franklin Pierce and James Buchanan. But the real party history concerns the politicians and statesmen's futile struggle to ignore and compromise the slavery issue, and the inevitability of the north-south split. In 1850, which divided the Democrats so disastrously that they did not elect a president again until 1864.

After the Van Buren administration (1837-41), the party came ever more completely under the dominance of the south, which was undeniably convinced that its economic, social and political interests were bound up in the preservation and extension of slavery. The south demanded the right to extend slavery into new territories and states as the only way to prevent the great industrial state of the north and the opening western becoming too strong in the federal government. To further this end, the Democratic party repudiated its basic principles under pressure from the south. It insisted upon the broadest possible construction of the constitution in order to force slavery on the new states or territories, and then applied to them the most rigid states rights doctrine in order to preserve slavery from constitutional interference—federal interference.

By 1860 the slavery question had assumed such aggravated form that it was impossible to ignore or compromise it, as had been

done in the Missouri Compromise of 1820. A final effort, however was made in the Compromise of 1850, which was proposed by Henry Clay and accepted by both the Whigs and Democrats. On the basis of this arrangement, the Democratic conventions of 1852 and 1856 assumed that the issue had been settled. Such an assumption was proved erroneous by subsequent events. No matter how the politicians side-stepped the question in their speeches and platforms, the absorbing, popular issue was slavery. They did not recognize or reckon with such political propaganda as Harriet Beecher Stowe's *Uncle Tom's Cabin*. The final crack up came in 1860, when the highly emotional delegates assembled for the Democratic convention in Charleston, S.C. on April 2, of that year. With the fight centring about the platform, the majority report of the resolutions committee set forth the viewpoint of the south.

The majority plank declared that each new state or territory must have the right to enter the federal union on its own terms, as expressed in a constitution adopted by vote of its residents, whether it prohibited or recognized slavery. Pending adoption of a constitution, the platform declared for free settlement in new states and territories, which meant that southerners could establish themselves there with their "property," including slaves. This was a deliberate defiance of the movement to prevent an increase in the number of slave states.

When the convention rejected this resolution and adopted a minority report ignoring any specific slavery declaration, half the southern delegates walked out. The northern wing adjourned to Baltimore, Md. and nominated Stephen A. Douglas of Illinois as its presidential candidate and Herschel V. Johnson of Georgia for vice president. The southern faction met in Richmond, Va., adopted the rejected majority report on slavery and nominated John C. Breckinridge of Kentucky and Joseph Lane of Oregon by unanimous vote.

Thus stood the Democratic party, riven and divided over a great moral issue and destined to defeat. The newly formed Republican party, which had been organized in 1854 at Jackson, Mich., won its first national victory because of its clear cut stand on the slavery question. Although Abraham Lincoln did not obtain a majority of the popular vote, he received a great majority in the electoral college because of the Democratic split.

From 1860 to 1932 the Democratic party became such a minority force that it was in executive power for only 16 years. Its defeat in 1876, however, when Samuel J. Tilden of New York, an anti-Tammany reformer, was the nominee, was questioned by those who believed that he defeated Rutherford B. Hayes. The enfranchisement of the Negro after the Civil War had two important political effects. It made the south almost unshakably Democratic, although there were defections in 1928 and 1948. It gave the Republicans a ballot box advantage in many key electoral states with a large Negro population, an advantage which persisted until the advent of Franklin D. Roosevelt in 1932.

It was not until 1883 that the Democrats won a presidential election with Grover Cleveland of New York. They lost with him in 1888, but elected him again in 1892. In 1896 the party once more split disastrously this time on the question of free silver as advocated by its candidate William Jennings Bryan of Nebraska. Through this addition to economic radicalism under the Bryan leadership the Democrats after 1896 again became a minority group in the large business, industrial and financial interests preferred the party of William McKinley and Marcus Hanna, and even looked kindly at first upon Theodore Roosevelt. The Democrats returned to power in 1913 with Woodrow Wilson, former governor of New Jersey and president of Princeton University, only because of the William Howard Taft-Theodore Roosevelt feud.

Woodrow Wilson rallied behind him the nation's idealistic youth and elderly reformers many of whom enrolled in his official family. Under the banner of the New Freedom, he urged and obtained legislation for greater federal regulation of banking and industry, including establishment of the federal reserve system, the Federal Trade Commission and strengthening of the antitrust statutes. Women became voters during his term in

*Popularly called "Republicans" up to the time of Andrew Jackson †Electorates chosen by legislatures in many states ‡Contest decided in house of representatives §Greeley died before electoral vote was cast †Elected

popular vote was 24,105,695 to 21,969,170 the smallest given to the Democratic nominee since the party returned to power in 1932

Roosevelt's program, known as the New Deal, provided for collective bargaining for labour unions under federal protection, subsidy payments to farmers in return for control of production, strict regulation of banking and investment, government ownership and operation of utilities, a social security and unemployment insurance system, guarantee of bank deposits, federal loans for home building and ownership. These "reforms" were denounced as "socialism," "centralization" and "federal dictatorship." But their general popularity was reflected in his four easy victories. A great factor in these Democratic successes was that, through heavy relief and war expenditures, the depression years of 1929-37 were succeeded by a period of apparent prosperity.

Domestic reform, however, was forgotten when the Japanese bombardment of Pearl Harbor embroiled the United States in World War II on Dec. 7, 1941. Roosevelt transformed the US into an "arsenal of democracy," and became the leader of the Allied forces which crushed Germany, Japan and Italy in 1945.

On his accession in April 1945, President Truman tried to expand his predecessor's New Deal into what he described as a Fair Deal. He proposed to congress such innovations as compulsory health insurance, a farm plan that would subsidize both producers and retail purchasers with public funds, a broad civil rights program, federal aid to education and numerous other expansions and controls. On all these issues he was thwarted by a coalition of Republicans and "Jeffersonian" Democrats, principally from southern states, in congress. Revelations of corruption in several executive agencies, especially the bureau of internal revenue and the Reconstruction Finance Corporation, were reminiscent of the U.S. Grant and Harding scandals. Foreign problems, especially soviet expansion and aggression, occupied Truman from 1947 on. Accepting the soviet challenge in what was then described as a "cold war," he sponsored huge loans and grants for restoration of Europe's economy, shattered by World War II, and for rearming the North Atlantic Treaty organization members. In June 1950 he ordered US forces in Japan to resist a Communist invasion of South Korea.

The Democratic party's long rule of 30 years came to an end with the election of Dwight D. Eisenhower on Nov. 4, 1952, as the first Republican president since Hoover. The Democratic candidate, Adlai E. Stevenson, although strongly supported by Truman in a bitter campaign, carried only 9 states and 89 electoral votes to 442 for Eisenhower. The Democrats' unsuccessful vice presidential candidate was Sen. John Sparkman of Alabama. (R. Tu, X.)

DEMOCRITUS, probably the greatest of the Greek physical philosophers, was a native of Abdera in Thrace, or as some say—probably wrongly—of Miletus (Diog. Laert. ix. 34). Our knowledge of his life is based almost entirely on tradition of an untrustworthy kind. He seems to have been born about 470 or 460 B.C. and was, therefore, an older contemporary of Socrates. He inherited considerable property, which enabled him to travel widely in the east in search of information. In Egypt he settled for seven years, during which he studied the mathematical and physical systems of the ancient schools. The extent to which he was influenced by the Magi and the eastern astrologists is a matter of pure conjecture. He returned from his travels impoverished, one tradition says that he received 500 talents from his fellow citizens and that a public funeral was decreed him. Another tradition states that he was regarded as insane by the Abderitans and that Hippocrates was summoned to cure him. Diodorus Siculus tells us that he died at the age of 90, others make him as much as 20 years older. His works, according to Diogenes Laertius, numbered 72 and were characterized by a purity of style which compares favourably with that of Plato. In the variety of his knowledge and in the importance of his influence on both Greek and modern speculation, Democritus was the Aristotle of the 5th century, while the sanity of his metaphysical theory has led many to regard him as the equal, if not the superior, of Plato.

His views may be treated under the following heads:

1. *The Atoms and Cosmology* (adopted in part at least from the doctrines of Leucippus). While agreeing with the Eleatics on the eternal sameness of Being (nothing can arise out of nothing; nothing can be reduced to nothing), Democritus followed the physicists in denying its oneness and immobility. Movement and

the White House. In his second four years he mobilized the country's resources for the defeat of Germany in World War I, and was hailed throughout the world as the "saviour of democracy." He inspired creation of the well-meant but ill-fated League of Nations.

Another Democratic night descended in 1920 with the election of the Republican nominee, Warren G. Harding, over the James M. Cox-Franklin Roosevelt ticket. The voters had become disillusioned with the war's sacrifices and division among the victorious Allies. The Democrats had no inspiring leadership, and no unity on any national problem. The question of prohibition split urban and rural factions. The backwash of war and the temporary and artificial but spectacular prosperity of the 1920s kept the party out of power from 1920 to 1932.

In 1932, however, the Democrats rode to victory with Franklin D. Roosevelt, governor of New York. Hard times under Herbert Hoover contributed to a triumph in which Roosevelt carried all but six states. In 1936 the party's achievement was overwhelming, only Maine and Vermont voting Republican. Roosevelt established a precedent in 1940 when he ran for and won a third term. He carried all but ten states and received a plurality of 4,900,000 votes over Wendell L. Willkie. He won a fourth term in 1944, defeating Gov. Thomas E. Dewey of New York. Roosevelt had 432 electoral votes to Dewey's 99, but his plurality of 3,600,000 over Dewey was the smallest of his four campaigns.

Roosevelt died on April 12, 1945, at Warm Springs, Ga., and was succeeded by Vice Pres. Harry S. Truman, former senator from Missouri. Truman served out the balance of the unfinished term, and was elected on Nov. 2, 1948, defeating the Republican candidate, Thomas E. Dewey, by 303 electoral votes to 189. The

plurality being necessary to explain the phenomena of the universe and impossible without space (not-Being) he asserted that the latter had an equal right with Being to be considered existent. Being is the Full (*πλήρες, plenum*), not-Being is the Void (*κενόν, vacuum*), the infinite space in which moved the infinite number of atoms into which the single Being of the Eleatics was broken up. These atoms are eternal and invisible, absolutely small, so small that their size cannot be diminished (hence the name *άτομος*, "indivisible"), absolutely full and incompressible, they are without pores and entirely fill the space they occupy, homogeneous, differing only in figure (as A from N), arrangement (as N from NA), position (as N is Z on its side), magnitude (and consequently in weight, although some authorities dispute this). But while the atoms thus differ in quantity, their differences of quality are only apparent, due to the impressions caused on our senses by different configurations and combinations of atoms. A thing is only hot or cold, sweet or bitter, hard or soft by convention (*νόμος*), the only things that exist in reality (*ερεθ*) are the atoms and the void. Locke's distinction between primary and secondary qualities is here anticipated. Thus, the atoms of water and iron are the same, but those of the former, being smooth and round, and therefore unable to hook on to one another, roll over and over like small globes, whereas the atoms of iron, being rough jagged and uneven, cling together and form a solid body. Since all phenomena are composed of the same eternal atoms (just as a tragedy and a comedy contain the same letters) it may be said that nothing comes into being or perishes in the absolute sense of the words (*ε*) the modern "indestructibility of matter" and "conservation of energy"), although the compounds of the atoms are liable to increase and decrease, appearance and disappearance—in other words, to birth and death. As the atoms are eternal and uncaused, so is motion, it has its origin in a preceding motion, and so on *ad infinitum*. For the love and hate of Empedocles and the *nous* (intelligence) of Anaxagoras, Democritus substituted fixed and necessary laws (not chance, that is a misrepresentation due chiefly to Cicero). Everything can be explained by a purely mechanical (but not fortuitous) system, in which there is no room for the idea of a providence or an intelligent cause working with a view to an end. The origin of the universe was explained as follows. An infinite number of atoms was carried downwards through infinite space. The larger (and heavier), falling with greater velocity, overtook and collided with the smaller (and lighter), which were thereby forced upwards. This caused various

atoms being intercalated between two corporeal atoms. Although, in accordance with his principles, Democritus was bound to regard the soul as material (composed of round, smooth, specially mobile atoms, identified with the fire atoms floating in the air), he admitted a distinction between it and the body, and is even said to have looked upon it as something divine. These all-permeating soul atoms exercise different functions in different organs, the head is the seat of reason, the liver of passion, the liver of desire. Life is maintained by the introduction of fresh atoms to replace those lost by exhalation and when re-piration, and consequently the supply of atoms, ceases the result is death. It follows that the soul perishes with, and in the same sense as, the body.

3 *Perception*—Sensations are the changes produced in the soul by external impressions, and are the result of contact, since every action of one body (and all representations are corporeal phenomena) upon another is of the nature of a shock. Certain emanations (*άττομοί, άττομοί*) or images (*εἰδωλά*), consisting of subtle atoms, thrown off from the surface of an object, pene-

trate the body through the pores and pass into the soul. At the same time Democritus distinguished between obscure (*ασορία*) cognition, resting on sensation alone, and genuine (*γρηγορία*), which is the result of inquiry by reason, and is concerned with atoms and void, the only real existences. This knowledge, however, he confessed was exceedingly difficult to attain.

It is in Democritus first that we find a real attempt to explain colour. He regards black, red, white and green as primary. White is characteristically smooth, *ε*, casting no shadow, even, flat, black is uneven, rough, shadowy and so on. The other colours result from various mixtures of these four, and are infinite in number. Colour itself is not objective, it is found not in the ultimate *plenum* and *vacuum*, but only in derived objects according to their physical qualities and relations.

4 *Theology*—Democritus rejected the notion of a deity taking part in the creation or government of the universe, but yielded to popular prejudice so far as to admit the existence of a class of beings, of the same form as men, grander, composed of very subtle atoms, less liable to dissolution, but still mortal, dwelling in the upper regions of air. However, according to Plutarch, Democritus recognized one god under the form of a fiery sphere, the soul of the world, but this idea is probably of later origin. The popular belief in gods was attributed by Democritus to the desire to explain extraordinary phenomena (thunder, lightning, earthquakes) by reference to superhuman agency.

5 *Ethics*—Democritus's moral system—the first collection of ethical precepts which deserves the name—strongly resembles the negative side of the system of Epicurus. The *summum bonum* is the maximum of pleasure with the minimum of pain. But true pleasure is not sensual enjoyment, it has its principle in the soul. It consists not in the possession of wealth or flocks and herds, but in good humour, in the just disposition and constant tranquility of the soul. Hence the necessity of avoiding extremes, too much and too little are alike evils. (See ETHICS, HISTORY of.)

DEMOGRAPHY, the science which deals with the statistics of health and disease, of the physical, intellectual, physiological and economical aspects of births, marriages and mortality (from Gr *δημος*, people, and *γράφειν*, to write). The first to employ the word was Achille Guillard in his *Elements de statistique humaine ou démographie comparée* (1855), but the meaning which he attached to it was merely that of the science which treats of the condition, general movement and progress of population in civilized countries, *i.e.* little more than what is comprised in the ordinary vital statistics, gleaned from census and registration reports. The word has come to have a much wider meaning and may now be defined as that branch of statistics which deals with the life-conditions of peoples.

DE MOIVRE, ABRAHAM (1667-1754), English mathematician of French Huguenot extraction, was born at Vitry, Champagne, on May 26, 1667. His eminence as a mathematician secured his admission into the Royal society in 1697, and also led to his being appointed by the Royal society to consider the famous dispute between Newton and Leibnitz. He was an intimate personal friend of Newton. De Moivre lived a quiet and uneventful life and died in London on Nov. 27, 1754. Two important theorems in trigonometry bear his name. (See TRIGONOMETRY.) The majority of his papers appeared in *Philosophical Transactions*. Among his separately published works the most important are *The Doctrine of Chances* (1716), in which he formulated the theory of recurring series, completed the theory of partial fractions, and laid down the rule for the probability of a

compound event *Miscellanea Analytica* (1730) contains his trigonometrical theorems

DEMONETIZATION, a term employed in monetary science in two different senses (a) The depriving or divesting of a metal of its standard monetary value. From 1663 to 1717 silver was the standard of value in England and gold coins passed at their market value. The debasement and underrating of the silver coinage insensibly brought about the demonetization of silver in England as a standard of value, and the substitution of gold. During the latter half of the 19th century a great depreciation occurred in the value of silver, owing to increasing production, and, consequently, it was impossible to preserve any ratio of stability between it and gold. This led to the abandonment or demonetization of the metal as a standard and to its use merely as token money. (b) The withdrawal of coin from circulation, as, for example, in England that of all pre-Victorian gold coins under the provisions of the Coinage Act 1880, and the royal proclamation of Nov. 22, 1890.

DEMONOLOGY, the branch of the science of religions which relates to superhuman beings which are not gods (*Daluvor*, demon, genius, spirit). Demons, when regarded as spirits, may either be human, or non human, separable souls, or incarnate spirits which have never inhabited a body, a sharp distinction is often drawn between these two classes which are frequently conceived as producing identical results, e.g., diseases.

The term includes (1) human souls regarded as geni or familiars, (2) such as receive a cult (for which see *ANCESTOR WORSHIP*), and (3) ghosts or other malevolent revenants, excluded are souls conceived as inhabiting another world. Demons may be regarded as corporeal, since primitive peoples do not distinguish clearly between material and immaterial beings.

Prevalence of Demons—All the affairs of life are supposed to be under the control of spirits, each ruling a certain element or even object, and themselves in subjection to a greater spirit. A rise in culture often results in an increase in the number of spiritual beings with whom man surrounds himself.

Character of Spiritual World—The ascription of malevolence to the world of spirits is by no means universal. Local spirits are often regarded as inoffensive in the main, true, the passer-by must make some trifling offering as he nears their place of abode, but it is only occasionally that mischievous acts, such as the throwing down of a tree on a passer by, are, in the view of the natives, perpetrated by the spirits. So, too, many of the

body of the victim (see *POSSESSION*), and either dominate his mind as well as his body, inflict specific diseases, or cause pains of various sorts. The demon theory of disease is still attested by some of our medical terms, epilepsy (*Gr. ἐπιδῆμις*, seizure) points to the belief that the patient is possessed. As a logical consequence of this view of disease the mode of treatment among peoples in the lower stages of culture is marked by an endeavour

FROM GREAT MALAY MAGIC (MACMILLAN & CO.)
MODELS OF PENANGGALAN AND LANGSUIR TWO MALAY BIRTH SPIRITS (VAMPIRES)

to propitiate the evil spirits by sacrifice, to expel them by spells, etc. (see *EXORCISM*), to drive them away by blowing, etc., and conversely to keep away small-pox by placing thorns and brushwood in the paths leading to places afflicted by that disease, in the hope of making the disease demon retrace his steps. Another way in which a demon is held to cause disease is by introducing itself into the patient's body and sucking his blood (Rivers, *Medicine, Magic and Religion*).

(b) One of the primary meanings of *daluvor* is that of genius (geni) or familiar, tutelary spirit.

The animal guardian appears in the *magat* of Central America, the *yumbas* of some Australian tribes, the *mantou* of the Red Indian and the bush soul of some West African tribes. All the world over it is held that the familiars of the witch or wizard can assume the form of animals (see *WITCHCRAFT*).

(c) The familiar is sometimes an ancestral spirit, and here we touch the fringe of the cult of the dead (see also *ANCESTOR WORSHIP*). Especially feared among many peoples are the souls of those who have committed suicide or died a violent death, the woman who dies in childbirth is held to become a demon of the most dangerous kind, even the unburied, as restless, dissatisfied spirits, are more feared than ordinary ghosts. These are they who cannot be reborn and are permanently severed from their community. They are therefore hostile. Funeral rites (see *DEAD DISPOSAL*) exhibit marked variations due to this cultural attitude. All spirits have power. Those who are or become permanent spirits have more power and more permanency than those who are due to return. The evocation of spirits, especially in the form of necromancy is an important branch of the demonology of many peoples.

(d) The vampire is a particular form of demon which calls for some notice. In Europe the Slavonic area is the principal seat of vampire beliefs, and as a natural development, means of preventing the dead from injuring the living have been evolved. The corpse of the vampire, which may often be recognized by its unnaturally ruddy and fresh appearance, should be staked down in the grave or its head should be cut off, it is interesting to note that the cutting off of heads of the dead was a neolithic burial rite.

(e) The vampire is frequently blended in popular idea with the *Poltergeist* (see *PSYCHICAL RESEARCH*) or knocking spirit and also with the wer-wolf (see *LYCANTHROPY*).

(f) Dream demons are very common, in fact the word "nightmare" (*AS. mæra*, spirit, elf) preserves this form of belief, which is found right down to the lowest culture. Horses too are said to be subject to the persecutions of demons, which ride them at night. Another class of nocturnal demons, the incubi and succubi, are said to consort with human beings in their sleep.

(g) Corresponding to the personal tutelary spirit (*supra*, b) we have the genus of buildings and places, and a snake was a frequent form for this kind of demon. The South African belief that the snakes which are in the neighbourhood of the kraal are the incarnations of the ancestors of the residents, suggests that some similar idea lay at the bottom of the Roman belief. To

A WITCHES FROLIC SHOWING THE DEVIL AND A PARTY OF WITCHES RIDING IN TUBS OVER A STORMY SEA ON THEIR WAY TO WRECK A SHIP

spirits especially concerned with the operations of nature are conceived as neutral or even benevolent.

Classification—Besides the distinctions of human and non human, hostile and friendly, the demons in which the lower races believe are classified by them according to function, each class with a distinctive name, with extraordinary minuteness.

(a) Natural causes, either of death or of disease, are hardly, if at all, recognized by the uncivilized, everything is attributed to spirits or magical influence of some sort. The spirits which cause disease may be human or non human, they may enter the

De Morgan's mathematical writings contributed powerfully towards the progress of the science. His memoirs on the "Foundations of Algebra," in the 7th and 8th volumes of the *Cambridge Philosophical Transactions*, contain important contributions to the philosophy of mathematical method. The work on *Trigonometry and Double Algebra* (1849) contains in the latter part a most luminous and philosophical view of existing and possible systems of symbolic calculus. De Morgan's long series of publications began in 1838 with a translation of part of Bourdon's *Elements of Algebra*. In 1830 appeared the first edition of his well known *Elements of Arithmetic*, which is distinguished by a simple yet thoroughly philosophical treatment of the ideas of number and magnitude, and by the introduction of new abbreviated processes of computation, to which De Morgan always attributed much practical importance. His other principal mathematical works were *The Elements of Algebra* (1835), a valuable but somewhat dry elementary treatise, the *Essay on Probabilities* (1838), forming the 107th volume of *Lardner's Cyclopaedia*, which forms a useful introduction to the subject, and *The Elements of Trigonometry and Trigonometrical Analysis, preliminary to the Differential Calculus* (1837). Two of his most elaborate treatises are to be found in the *Encyclopaedia metropolitana*, namely, the articles on the "Calculus of Functions" and the "Theory of Probabilities." De Morgan's minor mathematical writings were scattered over various periodicals. A list of these and other papers will be found in the *Royal Society's Catalogue*, which contains 42 entries under the name of De Morgan.

But it is probably as a logical reformer that De Morgan will be best remembered. In this respect he stands alongside of his great contemporaries, Sir W. R. Hamilton and George Boole, as one of several independent discoverers who enounced the principle of the quantification of the predicate. De Morgan always laid much stress upon the importance of logical training. In his admirable papers upon the modes of teaching arithmetic and geometry, originally published in the *Quarterly Journal of Education* (reprinted in *The Schoolmaster*, vol. II), he remonstrated against the neglect of logical doctrine. In 1839 he produced a small work called *First Notions of Logic*, giving what he had found by experience to be much wanted by students commencing with Euclid. In Oct. 1846 he completed the first of his investigations, in the form of a paper printed in the *Transactions of the Cambridge Philosophical Society* (vol. VIII, No. 29), which gave rise to a controversy with Sir W. R. Hamilton regarding the independence of De Morgan's discovery. The eight forms of proposition adopted by De Morgan as the basis of his system partially differ from those which Hamilton derived from the quantified predicate. The general character of De Morgan's development of logical forms was wholly peculiar and original on his part.

Late in 1847 De Morgan published his principal logical treatise, *Formal Logic, or The Calculus of Inference, Necessary and Probable*. This contains a reprint of the *First Notions*, an elaborate development of his doctrine of the syllogism, and of the numerical definite syllogism, together with chapters on probability, induction, old logical terms and fallacies. There followed at intervals, in the years 1850, 1858, 1860 and 1863, a series of four elaborate memoirs on the "Syllogism" printed in volumes IX and X of the *Cambridge Philosophical Transactions*. These papers

him to leave University college. The refusal of the council to accept the recommendation of the senate, that they should appoint an eminent Unitarian minister to the professorship of logic and mental philosophy, revived all De Morgan's sensitiveness on the subject of sectarian freedom. In 1867 he lost his son George Campbell De Morgan, a young man of the highest scientific promise, whose name, as De Morgan expressly wished, will long be connected with the London Mathematical Society, of which he was one of the founders. From this time De Morgan rapidly fell into ill health (previously almost unknown to him), dying on March 18, 1871. An interesting and truthful sketch of his life will be found in the *Monthly Notices of the Royal Astronomical Society* for Feb. 9, 1872, vol. XXII, p. 112, written by A. C. Ran-nyard, who says, "He was the kindest as well as the most learned of men—benignant to everyone who approached him, never forgetting the claims which weakness has on strength."

It is impossible to omit a reference to his witty sayings, some specimens of which are preserved in the *Diary of Henry Crabb Robinson* (1866), which also contains a humorous account of H. C. R. by De Morgan.

A very large part of De Morgan's work is contained in periodical publications, and in encyclopaedias and works of reference. His correspondence with contemporary scientific men was very extensive, and full of interest. It remains unpublished, as does also a large mass of mathematical tracts which he prepared for the use of his students, treating all parts of mathematical science and embodying some of the matter of his lectures. De Morgan's library was purchased by Lord Overstone, and presented to the University of London.

See S. de Morgan, *Memoir of Augustus de Morgan* (1882).

DE MORGAN, WILLIAM FREND (1839-1917), artist and novelist, son of Augustus de Morgan, born in London on Nov. 16, 1839, and educated at University college and the Academy schools. He became a member of the circle which gathered round Rossetti, William Morris and Burne Jones, and experimented in various forms of decorative art. After his father's death the family settled at 30 Cheyne row, and there, in the back garden, De Morgan set up a kiln and began to make pottery. He re-discovered the secret of the brilliant blue and green glazes of the old potters, and presently formed a firm to develop the manufacture of tiles and other pottery on a commercial scale. He had an inventive genius, and nearly all the appliances of the factory were designed by him. The De Morgan ware became famous, the tiles were used for the decoration of some of the great liners, and in some cases for exterior decoration of houses. There are many fine examples of his work in the ceramic galleries of the Victoria and Albert museum, London, which also possesses a collection of his sketches. In 1905, when he was over 65, he retired from business, and began his extremely successful career as a novelist. He had written stories for recreation, and *Joseph Vance*, fragments of which had been rescued from destruction by his wife, appeared in 1906. In Charles Heath of *Alice-for Short* (1907) he put, he said, "a good deal of himself." Other novels, which had a large circulation, followed. He died in London of trench fever on Jan. 15, 1917.

See Mrs. A. W. M. Stirling, *William de Morgan and his Wife* (1922).

DEMOSTHENES (d. 413 B.C.), Athenian general, first appeared in 426 B.C. In this year Demosthenes and Procles led of 30 ships on a cruise round the Peloponnese, first made on Leucas, but this was abandoned for want of the Aetolians, which was the first step in a race through central Greece to Phocis and Boeotia, where, who knew the country, failed him, but he arrived with 20

Hamilton aptly described it, is fitted to exhibit the real analogy between quantitative and qualitative reasoning, which is rather to be sought in the logical works of Boole.

In 1866 his life became clouded by the circumstances which led

then made a compact with Menedaeus to allow the Spartans to withdraw, and wiped out the remainder of the Ambraciots at Aedonenes. The result of this campaign was the complete destruction of the Corinthian sphere of influence in north-west Greece, and Demosthenes, having redeemed his early failure, could now return to Athens. In 425 he went with Eurymedon and Sophocles on an expedition towards Sicily. He was delayed at Pylos, which was fortified by the soldiers to beguile their idleness, and Demosthenes stayed there with five ships and successfully defended it against attacks from Sparta and Corcyra. The arrival of an Athenian fleet turned the besiegers into the besieged, the Spartans were blockaded in Spachterium, and their eventual defeat and capture was really the work of Demosthenes, though Cleon had nominally superseded him. The feature of these operations was the successful use of light infantry, a lesson which Demosthenes had learned from his early campaigns, but which no other commander during the war seems to have grasped. The year 424 saw him engaged in the abortive attack on Megara and the equally unsuccessful invasion of Boeotia, which resulted in the battle of Delium. In 413 he was sent with Eurymedon to reinforce Nicias before Syracuse. As soon as he arrived he conducted a night attack on Epipolae. When this failed he advised immediate retreat, but was overruled by Nicias. When at last the retreat began, the division under Demosthenes fell behind, was cornered in an orchard and surrendered. Demosthenes was put to death. We know practically nothing of his political views, but Aristophanes (*Ecl.* 242) suggests that he was leader of the party opposed to Cleon.

Bibliography.—Thucydides, II. IV., VII.; Diodorus, XI. XI.; Aristophanes, *Ecl.* 242; see the Histories of Greece, and Grundy, in *Jour. Hell. Stud.* (1896); A. W. Gomme, in *Class. Quart.*, xvi. 36 (1923).

DEMOSTHENES, the great Attic orator and statesman, was born in 384 (or 383) B.C. His father, who bore the same name, was an Athenian citizen belonging to the deme of Paeania. His mother, Cleobule, was the daughter of Gylon, a citizen who had been active in procuring the protection of the kings of Bosphorus for the Athenian colony of Nymphaeum in the Crimea, and whose wife was a native of that region. On these grounds the adversaries of Demosthenes, in after-days, used absurdly to taunt him with a traitorous or barbarian ancestry. The boy had a bitter fore-taste of life. He was seven years old when his father died, leaving property (in a manufactory of swords, and another of upholstery) worth about £3,500, which, invested as it seems to have been (20% was not thought exorbitant), would have yielded rather more than £600 a year—a handsome, though not a great fortune. But his guardians—two nephews of his father, Aphobus and Demophon, and one Therippides—abused their trust, and handed over to Demosthenes, when he came of age, rather less than one-seventh of his patrimony, perhaps between £50 and £60 a year. Demosthenes, after studying with Isaeus (*q.v.*), brought an action against Aphobus, and gained a verdict for about £3,400. But it does not appear that he got the money, and, after some more fruitless proceedings against Onetor, the brother-in-law of Aphobus, the matter was dropped, not, however, before his relatives had managed to throw a public burden (the equipment of a ship of war) on their late ward, whereby his resources were yet further straitened. He now became a professional writer of speeches or pleas (*λογιστράφος*) for the law courts, sometimes speaking himself. Biographers have delighted to relate how painfully Demosthenes made himself a tolerable speaker, how, with pebbles in his mouth, he tried his lungs against the winds, how he declaimed as he ran up hills, how he shut himself up in a cell, having first gnashed himself against a longing for the haunts of men by shaving one side of his head, how he wrote out Thucydides eight times, how he was derided by the Assembly and encouraged by a judicious actor who met him moping about the Peiraeus. He certainly seems to have met him moping about the Peiraeus. He certainly seems to have met him moping about the Peiraeus. He certainly seems to have met him moping about the Peiraeus. (the stalwart Achilles upbraid him with never having been a sportsman), and he probably had some sort of defect or imperfection in his speech as a boy. Perhaps the most interesting fact about his work for the law courts is that he seems to have continued it, in some measure, through the most exciting parts of

his great political career. The speech for Phormion belongs to the same year as the plea for Megalopolis. The speech against Boeotus "Concerning the Name" comes between the First Philippic and the First Olynthic.

Political Career and Creed.—The political career of Demosthenes, from his first direct contact with public affairs in 355 B.C. to his death in 322, has an essential unity. It is the assertion, in successive forms adapted to successive moments, of unchanging principles. Externally, it is divided into the chapter which precedes and the chapter which follows Chaeronea. But its inner meaning, the secret of its indomitable vigour, the law which harmonizes its apparent contrasts, cannot be understood unless it is regarded as a whole. Still less can it be appreciated in all its large wisdom and sustained self-mastery if it is viewed merely as a duel between the ablest champion and the craftiest enemy of Greek freedom. The time indeed came when Demosthenes and Philip stood face to face as representative antagonists in a mortal conflict. But, for Demosthenes, the special peril represented by Philip, the peril of subjugation to Macedonia, was merely a disastrous accident. Philip happened to become the most prominent and most formidable type of a danger which was already threatening Greece before his fateful star arose. As Demosthenes said to the Athenians, if the Macedonian had not existed they would have made another Philip for themselves. Until Athens recovered something of its old spirit, there must ever be a great standing danger, not for Athens only, but for Greece—the danger that sooner or later, in some shape from some quarter, barbarian violence would break up the tradition of separate Hellenic life.

What was the true relation of Athens to Greece? The answer which he gave to this question is the key to the life of Demosthenes. Athens, so Demosthenes held, was the natural head of Greece. Not, however, as an empire holding subject or subordinate cities in a dependence more or less compulsory. Rather as that city which most nobly expressed the noblest attributes of Greek political existence. Wherever the cry of the oppressed goes up from Greece against Greece, it was the voice of Athens which should first remind the oppressor that Hellene differed from barbarian in postponing the use of force to the persuasions of equal law. Wherever a barbarian hand offered wrong to any city of the Hellenic sisterhood, it was the arm of Athens which should first be stretched forth in the holy strength of Apollo the Averter. Athens must never again seek "empire" in the sense which became odious under the influence of Cleon and Hyperbolus. Athens must aim at leading a free confederacy, of which the members should be bound to her by their own truest interests.

Such, in the belief of Demosthenes, was the part which Athens must perform if Greece was to be safe. But reforms must be effected before Athens could be capable of such a part. Athens had long been suffering from the profound decay of public spirit. Since the early years of the Peloponnesian War, the separation of Athenian society from the State had been growing more and more marked. Politics were now managed by a small circle of politicians. Wars were conducted by professional soldiers whose troops were chiefly mercenaries. The mass of the citizens took no active interest in public affairs. But, though indifferent to principles, they had quickly sensitive partialities for men, and it was necessary to keep them in good humour. Pericles had introduced the practice of giving a small bounty from the Treasury to the poorer citizens, for the purpose of enabling them to attend the theatre at the great festivals,—in other words, for the purpose of bringing them under the concentrated influence of the best Attic culture. A provision eminently wise for the age of Pericles easily became a mischief when the once honourable name of "demagogue" began to mean a flatterer of the mob. Before the end of the Peloponnesian War the festival-money (*theorikon*) was abolished. A few years after the restoration of the democracy it was again introduced. But until 354 B.C. it had never been more than a gratuity, of which the payment depended on the Treasury having a surplus. In 354 B.C. Eubulus became steward of the Treasury. His first measure was to make the festival-money a permanent item in the budget. Thenceforth this bounty was in reality very much what Demades afterwards

called it,—the cement (κόλλα) of the democracy

Forensic Speeches in Public Causes—Years before the danger from Macedon was urgent, Demosthenes had begun the work of his life—the effort to lift the spirit of Athens, to revive the old civic loyalty, to rouse the city into taking that place and performing that part which her own welfare as well as the safety of Greece prescribed. His formally political speeches must never be considered apart from his forensic speeches in public causes. The Athenian procedure against the proposer of an unconstitutional law—*nomos*, of a law incompatible with existing laws—had a direct tendency to make the law court, in such cases, a political arena. The same tendency was indirectly exerted by the tolerance of Athenian juries (in the absence of a presiding expert like a judge) for irrelevant matter, since it was usually easy for a speaker to make capital out of the adversary's political antecedents. But the forensic speeches of Demosthenes for public causes are not only political in this general sense. They are documents, as indispensable as the Olynthiacs or Philippics, for his own political career. Only by taking them along with the formally political speeches, and regarding the whole as one unbroken series, can we see clearly the full scope of the task which he set before him,—a task in which his long resistance to Philip was only the most dramatic incident, and in which his real achievement is not to be measured by the event of Chaeroneia.

A forensic speech, composed for a public cause, opens the political career of Demosthenes with a protest against a signal abuse. In 355 B.C., at the age of 20, he wrote the speech "Against Androtion." This combats on legal grounds a proposal that the out-going *Boule* should receive the honour of a golden crown. In its larger aspect, it is a denunciation of the corrupt system which that *Boule* represented, and especially of the manner in which the Treasury had been administered by Aristophon. In 354 B.C. Demosthenes composed and spoke the oration "Against Leptines," who had effected a slender saving for the State by the expedient of revoking those hereditary exemptions from taxation which had at various times been conferred in recognition of distinguished merit. He answers the advocates of the retrenchment by pointing out that the public interest will not ultimately be served by a wholesale violation of the public faith. In the same year he delivered his first strictly political speech, "On the Navy Boards" (*Symmetries*). The Athenians, irritated by the support which Artaxerxes had lately given to the revolt of their allies, and excited by rumours of his hostile preparations, were feverishly eager for a war with Persia. Demosthenes urges that such an enterprise would at present be useless, that it would fail to unite Greece, that the energies of the city should be reserved for a real emergency, but that, before the city can successfully cope with any war, there must be a better organization of resources, and, first of all, a reform of the navy.

Two years later (352 B.C.) he is found dealing with a more definite question of foreign policy. Sparta, favoured by the depression of Thebes in the Phocian War, was threatening Megalopolis. Both Sparta and Megalopolis sent embassies to Athens. Demosthenes supported Megalopolis. The ruin of Megalopolis would mean, he argued, the return of Spartan domination in the Peloponnese. Athenians must not favour the tyranny of any one city. They must respect the rights of all the cities, and thus promote unity based on mutual confidence. In the same year Demosthenes wrote the speech "Against Timocrates" to be

At Athens Demosthenes points out that such adulation is as futile

as it is fulsome. Athens can secure the permanence of her foreign possessions only by being strong enough to hold them.

Thus, between 355 and 352, Demosthenes had laid down the main lines of his policy. Domestic administration must be purified. Statesmen must be made to feel that they are responsible to the State. They must not be allowed to anticipate judgment on their deserts by voting each other golden crowns. They must not think to screen misappropriation of public money by getting partisans to pass new laws about State debtors. Foreign policy must be guided by a larger and more provident conception of Athenian interests. When public excitement demands a foreign war, Athens must not rush into it without asking whether it is necessary, whether it will have Greek support, and whether she herself is ready for it. When a strong Greek city threatens a weak one, and seeks to purchase Athenian connivance with the bribe of a border town, Athens must remember that duty and prudence alike command her to respect the independence of all Greeks. When it is proposed, by way of insurance on Athenian possessions abroad, to flatter the favourite of a doubtful ally, Athens must remember that such devices will not avail. Power which has no army except on paper, and no ships fit to leave their moorings.

Athens and Philip—But the time had gone by when Athenians could have tranquil leisure for domestic reform. A danger, calling for prompt action, had at last come very near. For six years Athens had been at war with Philip on account of his seizure of Amphipolis. Meanwhile he had destroyed Potidaea and founded Philippi. On the Thracian coasts he had become master of Abdera and Maroneia. On the Thessalian coast he had acquired Methone. In a second invasion of Thessaly, he had overthrown the Phocians under Onomarchus, and had advanced to Thermopylae, to find the gates of Greece closed against him by an Athenian force. He had then marched to Heracleum on the Propontis, and had dictated a peace to Cersobleptes. He had formed an alliance with Cardia, Perinthus and Byzantium. Lastly, he had begun to show designs on the great Confederacy of Olynthus, the more warlike Miletus of the North. The First Philippic of Demosthenes was spoken in 351 B.C. The Third Philippic—the latest of the extant political speeches—was spoken in 341 B.C. Between these he delivered eight political orations, of which seven are directly concerned with Philip. The whole series falls into two great divisions. The first division comprises those speeches which were spoken against Philip while he was still a foreign Power threatening Greece from without. Such are the First Philippic and the three orations for Olynthus. The second division comprises the speeches spoken against Philip when, by admission to the Amphictyonic Council, he had now won his way within the circle of the Greek States, and when the issue was no longer between Greece and Macedonia, but between the Greek and Macedonian parties in Greece. Such are the speech "On the Peace," the speech "On the Embassy," the speech "On the Chersonese," the Second and Third Philippics.

The First Philippic, spoken early in 351 B.C., was no sudden note of alarm drawing attention to an unnoticed peril. On the contrary, the assembly was weary of the subject. For six years the war with Philip had been a theme of barren talk. Demosthenes urges that it is time to do something, and to do it with a plan. Athens fighting Philip has fared, he says, like an amateur boxer opposed to a skilled pugilist. The helpless hands have only followed blows which a trained eye should have taught them to parry. An Athenian force must be stationed in the north, at Lemnos or Thasos. Of 2,000 infantry and 200 cavalry at least one quarter must be Athenian citizens capable of directing the mercenaries.

Later in the same year Demosthenes did another service to the cause of national freedom. Rhodes, severed by its own act from the Athenian Confederacy, had since 355 been virtually subject to Mausolus, prince (βασιλεύς) of Caria, himself a tributary of Persia. Mausolus died in 351, and was succeeded by his widow Artemisia. The democratic party in Rhodes now appealed to Athens for help in throwing off the Carian yoke. Demosthenes supported their application in his speech "For the Rhodians."

No act of his life was a truer proof of statesmanship. He failed. But at least he had once more warned Athens that the cause of political freedom was everywhere her own and that, wherever that cause was forsaken, there a new danger was created both for Athens and for Greece.

Next year (350) an Athenian force under Phocion was sent to Euboea, in support of Plutarchus, tyrant of Eretria, against the faction of Cleitarchus. Demosthenes protested against spending strength, needed for greater objects, on the local quarrels of a despot. Phocion won a victory at Tamynae. But the "inglorious and costly war" entailed an outlay of more than £12,000 on the ransom of captives alone, and ended in the total destruction of Athenian influence throughout Euboea. That island was now left an open field for the intrigues of Philip. Worst of all, the party of Eubulus had not only defeated a proposal, arising from this campaign, for applying the festival money to the war fund, but actually carried a law making it high treason to renew the proposal. The degree to which political enmity was exasperated by the Euboean War may be judged from the incident of Meidias, an adherent of Eubulus, and a type of opulent rowdism. Demosthenes was choragus of his tribe, and was wearing the robe of that sacred office at the great festival in the theatre of Dionysus, when Meidias struck him on the face. The affair was eventually compromised. The speech "Against Meidias" written by Demosthenes for the trial (in 349) was neither spoken nor completed, and remains, as few will regret, a sketch.

Olynthiaics—It was now three years since, in 352, the Olynthians had made peace with Athens. In 350 a second Olynthian embassy had obtained Athenian help. In 349 Philip opened war against the Chalcidic towns of the Olynthian League. The First and Second Olynthiaics of Demosthenes were spoken in that year in support of sending one force to defend Olynthus and another to attack Philip. "Better now than later," is the thought of the First Olynthiac. The Second argues that Philip's strength is overrated. The Third—spoken in 348—carries us into the midst of action. It deals with practical details. The festival-fund must be used for the war. The citizens must serve in person. A few months later, Olynthus and the 32 towns of the confederacy were swept from the earth. Men could walk over their sites, Demosthenes said seven years afterwards, without knowing that such cities had existed. It was now certain that Philip could not be stopped outside of Greece. The question was, what point within Greece should be allowed to reach?

Demosthenes saw that Athens must have time to collect strength. Nothing could be gained, meanwhile, by going on with the war. Macedonian sympathizers at Athens, of whom Philocrates was the chief, also favoured peace. Elsewhere envoys, including Phocion, Aeschines, and Demosthenes, were sent to Philip in February, 348 B.C. After a debate at Athens, peace was concluded with Philip in April. Philip on the one hand, Athens and her allies on the other, were to keep what they respectively held at the time when the peace was ratified. But here the Athenians made a fatal error. Philip was now at war with the people of Halus in Thessaly. Thebes had for ten years been at war with Phocis. Here were two distinct chances for Philip's armed intervention in Greece. But if the Halians and the Phocians were included in the peace, Philip could not help army against them without violating the peace. Accordingly Philip insisted that they should not be included. Demosthenes insisted they should be included. They were not included. The result followed swiftly. The same envoys were sent a second time to Philip at the end of April 346 for the purpose of renewing his oaths in ratification of the peace. It was late in June when he returned from Thrace to Pella—thus gaining, under the terms, all the towns that he had taken meanwhile. He next took the envoys with him through Thessaly to Thermopylae. There—at the invitation of Thessalians and Thebans—he intervened in the Phocian

War. Phalaecus surrendered. Phocis was crushed. Philip took its place in the Amphictyonic Council, and was thus established as a Greek power in the very centre, at the sacred hearth, of Greece. The right of precedence in consultation of the oracle (*προμαντεία*) was transferred from Athens to Philip. While indignant Athenians were clamouring for the revocation of the peace, Demosthenes upheld it in his speech "On the Peace" in September. It ought never to have been made on such terms, he said. But, having been made, it had better be kept. "If we went to war now, where should we find allies? And after losing Oropus, Amphipolis, Cardia, Chios, Cos, Rhodes, Byzantium, shall we fight about the shadow of Delphi?"

Second and Third Philippic—During the eight years between the peace of Philocrates and the battle of Chaeroneia, the authority of Demosthenes steadily grew, until it became first predominant and then paramount. He had, indeed, a melancholy advantage. Each year his argument was more and more cogently enforced by the logic of facts. In 344 he visited the Peloponnese for the purpose of countering Macedonian intrigue. Mistrust, he told the Peloponnesian cities, is the safeguard of free communities against tyrants. Philip lodged a formal complaint at Athens. Demosthenes replied in the Second Philippic. "If," he said, "Philip is the friend of Greece, we are doing wrong. If he is the enemy of Greece, we are doing right. Which is he? I hold him to be our enemy, because everything that he has hitherto done has benefited himself and hurt us." The prosecution of Aeschines for malversation on the embassy (commonly known as *De falsa legatione*), which was brought to an issue in the following year, marks the moral strength of the position now held by Demosthenes. When the gravity of the charge and the complexity of the evidence are considered, the acquittal of Aeschines by a narrow majority must be deemed his condemnation. The speech "On the Affairs of the Chersonese" and the Third Philippic were the crowning efforts of Demosthenes. Spoken in the same year, 341 B.C., and within a short space of each other, they must be taken together. The speech "On the Affairs of the Chersonese" regards the situation chiefly from an Athenian point of view. "If the peace means," argues Demosthenes, "that Philip can seize with impunity one Athenian possession after another, but that Athenians shall not on their peril touch aught that belongs to Philip, where is the line to be drawn? We shall go to war, I am told, when it is necessary. If the necessity has not come yet, when will it come?" The Third Philippic ascends from the Athenian to the Hellenic view. Philip has annihilated Olynthus and the Chalcidic towns. He has ruined Phocis. He has frightened Thebes. He has divided Thessaly. Euboea and the Peloponnese are his. His power stretches from the Adriatic to the Hellespont. Where shall be the end? Athens is the last hope of Greece. And, in this final crisis, Demosthenes was the embodied energy of Athens. It was Demosthenes who went to Byzantium, brought the estranged city back to the Athenian Alliance, and snatched it from the hands of Philip. It was Demosthenes who, when Philip had already seized Elatea, hurried to Thebes, and by his passionate appeal gained one last chance, the only possible chance, for Greek freedom, who broke down the barrier of an inveterate jealousy, who brought Thebans to fight beside Athenians, and who thus won at the eleventh hour a victory for the spirit of loyal union which took away at least one bitterness from the unspeakable calamity of Chaeroneia.

After Chaeroneia—But the work of Demosthenes was not closed by the ruin of his cause. During the last 16 years of his life (338–322) he rendered services to Athens not less important, and perhaps more difficult, than those which he had rendered before. He was now, as a matter of course, foremost in the public affairs of Athens. In Jan. 337, he spoke the funeral oration over those who had fallen at Chaeroneia. He was member of a commission for strengthening the fortifications of the city (*τεροπολις*). He administered the festival-fund. During a dearth which visited Athens between 330 and 326 he was charged with the organization of public relief. In 324 he was chief (*ἀρχιτέκτορας*) of the sacred embassy to Olympia. Already, in 336, Ctesiphon had proposed that Demosthenes should receive a golden crown from the

¹It is generally agreed that the Third Olynthiac is the latest, but the question of the order of the First and Second has been much discussed. See *History of Greece*, chap. 38, appendix, who prefers the arrangement II, I, III, and Blass, *Die attische Beredsamkeit*, II, p. 350.

State, and that his extraordinary merits should be proclaimed in the theatre at the Great Dionysia. The proposal was adopted by the senate as a bill (*πρόβουλενα*), but it must be passed by the Assembly before it could become an act (*νόμος*). To prevent this, Aeschines gave notice, in 336, that he intended to proceed against Ctesiphon for having proposed an unconstitutional measure. For six years Aeschines avoided action on this notice. At last, in 330, the patriotic party felt strong enough to force him to an issue. Aeschines spoke the speech "Against Ctesiphon," an attack on the whole public life of Demosthenes. Demosthenes gained an overwhelming victory for himself and for the honour of Athens in the most finished, the most splendid and the most pathetic work of ancient eloquence "On the Crown."

In the winter of 335-324 Harpalus, the receiver general of Alexander in Asia, fled to Greece, taking with him 8,000 mercenaries, and treasure equivalent to about a million and a quarter sterling. On the motion of Demosthenes he was warned from the harbours of Attica. Having left his troops and part of his treasure at Tænarum, he again presented himself at the Peiræus, and was now admitted. He spoke fervently of the opportunity which offered itself to those who loved the freedom of Greece. All Asia would rise with Athens to throw off the hated yoke. Fiery patriots like Hyperides were in raptures. For zeal which could be bought Harpalus had other persuasions. But Demosthenes stood firm. War with Alexander would, he saw, be madness. It could have but one result—some indefinitely worse doom for Athens. Antipater and Olympias presently demanded the surrender of Harpalus. Demosthenes opposed this. But he reconciled the dignity with the loyalty of Athens by carrying a decree that Harpalus should be arrested, and that his treasure should be deposited in the Parthenon, to be held in trust for Alexander. Harpalus escaped from prison. The amount of the treasure, which Harpalus had stated as 700 talents, proved to be no more than 350. Demosthenes proposed that the Areopagus should inquire what had become of the other 350. Six months spent in party intrigues, passed before the Areopagus gave in their report (*ἀπόφασις*). The report incriminated nine persons. Demosthenes headed the list of the accused. Hyperides was among the ten public prosecutors. Demosthenes was condemned, fined fifty talents, and, in default of payment, imprisoned. After a few days he escaped from prison to Aegina, and thence to Troezen. Two things in this obscure affair are beyond reasonable doubt. First, that Demosthenes was not bribed by Harpalus. The hatred of the Macedonian party towards Demosthenes, and the fury of those vehement patriots who cried out that he had betrayed their best opportunity, combined to procure his condemnation, with the help, probably, of some appearances which were against him. Secondly, it can scarcely be questioned that, by withstanding the hot headed patriots at this juncture, Demosthenes did heroic service to Athens.

Next year (323 B.C.) Alexander died. Then the voice of Demosthenes, calling Greece to arms, rang out like a trumpet. Early in Aug. 322 the battle of Crannon decided the Lamiæ War against Greece. Antipater demanded, as the condition on which he would refrain from besieging Athens, the surrender of the leading patriots. Demades moved the decree of the assembly by which Demosthenes, Hyperides, and some others were condemned to death as traitors. A Macedonian garrison occupied Munychia, on the 20th of Boedromion (Sept. 16) 322, the day on which, 13 years before, Alexander had punished the rebellion of Thebes with annihilation.

Death.—The condemned men had fled to Aegina. Parting there from Hyperides and the rest, Demosthenes went on to Calauria, a small island off the coast of Argolis. He sought asylum in an ancient sanctuary, the temple of Poseidon. Archias of Thurii, a man who, like Aeschines, had begun life as a tragic actor, and who was now in the pay of Antipater, soon traced the fugitive, landed in Calauria, and appeared before the temple of Poseidon with a body of Thracian spearmen. Archias was not the man to stick at sacrilege. In Aegina, Hyperides and the others had been taken from the shrine of Aæcus. But he hesitated to violate an asylum so peculiarly sacred as the Calau-

rian temple. Standing before its open door, with his Thracian soldiers around him, he endeavoured to prevail on Demosthenes to quit the holy precinct. Antipater would be certain to pardon him. Demosthenes sat silent, with his eyes fixed on the ground. At last, as the emissary persisted in his bland persuasions, he looked up and said "Archias, you never moved me by your acting, and you will not move me now by your promises." Archias lost his temper, and began to threaten. "Now," rejoined Demosthenes, "you speak like a real Macedonian oracle, before you were acting. Wait a moment, then, till I write to my friends." With these words, Demosthenes withdrew into the inner part of the temple—still visible, however, from the entrance. He took out a roll of paper, as if he were going to write, put the pen to his mouth, and bit it, as was his habit in composing. Then he threw his head back, and drew his cloak over it. The Thracian spearmen, who were watching him from the door, began to gibe at his cowardice. Archias went in to him, encouraged him to rise, repeated his old arguments, talked to him of reconciliation with Antipater. By this time Demosthenes felt that the poison which he had sucked from the pen was beginning to work. He drew the cloak from his face, and looked steadily at Archias. "Now you can play the part of Creon in the tragedy as soon as you like," he said, "and cast forth my body unburied. But I, O gracious Poseidon, quit thy temple while I yet live, Antipater and his Macedonians have done what they could to pollute it." He moved towards the door, calling to them to support his tottering steps. He had just passed the altar of the god, when he fell, and with a groan gave up the ghost. (Oct. 322 B.C.)

Political Character and Oratory.—As a statesman, Demosthenes needs no epitaph but his own words in the speech "On the Crown,"—*I say that, if the event had been manifest to the whole world beforehand, not even then ought Athens to have forsaken this course, if Athens had any regard for her glory, or for her past, or for the ages to come.* The Persian soldier in Herodotus, following Xerxes to foreseen ruin, confides to his fellow guest at the banquet that the bitterest pain which man can know is *πολλὰ φρονέοντα μηδὲν κρᾶναι*—complete, but helpless, prescience. In the grasp of a more inexorable necessity, the champion of Greek freedom was borne onward to a more tremendous catastrophe than that which strewn the waters of Salamis with Persian wrecks and the field of Plataea with Persian dead, but to him, at least, it was given to proclaim aloud the clear and sure foreboding that filled his soul, to do all that true heart and free hand could do for his cause, and, though not to sive, yet to encourage, to console and to ennoble. As the inspiration of his life was larger and higher than the mere courage of resistance, so his merit must be regarded as standing altogether outside and above the struggle with Macedon. The great purpose which he set before him was to revive the public spirit, to restore the political vigour, and to re-establish the Panhellenic influence of Athens—never for her own advantage merely, but always in the interest of Greece. His glory is, that while he lived he helped Athens to live a higher life. Wherever the noblest expressions of her mind are honoured, wherever the large conceptions of Pericles command the admiration of statesmen, wherever the architect and the sculptor love to dwell on the masterpieces of Ictinus and Pheidias, wherever the spell of ideal beauty or of lofty contemplation is exercised by the creations of Sophocles or of Plato, there it will be remembered that the spirit which wrought in all these would have passed sooner from among men, if it had not been recalled from a trance by the passionate breath of Demosthenes.

The orator in whom artistic genius was united, more perfectly than in any other man, with moral enthusiasm and with intellectual grasp, has held in the modern world the same rank which was accorded to him in the old, but he cannot enjoy the same appreciation. Sincerity and intensity are, to the modern reader, the most obvious characteristics of Demosthenes. His style is, on the whole, singularly free from what we are accustomed to regard as rhetorical embellishment. Where the modern orator would employ a wealth of imagery, or elaborate a picture in exquisite detail, Demosthenes is content with a phrase or a word

Burke uses, in reference to Hyder Ali, the same image which Demosthenes uses in reference to Philip "Compounding all the materials of fury, havoc, desolation, into one black cloud, he hung for a while on the declivity of the mountains. Whilst the authors of all these evils were idly and stupidly gazing on this menacing meteor, which darkened all their horizon, it suddenly burst, and poured down the whole of its contents upon the plains of the Carnatic." Demosthenes forbears to amplify "The people gave their voice, and the danger which hung upon our borders went by like a cloud." To our modern feeling, the eloquence of Demosthenes exhibits everywhere a general stamp of earnest and simple strength. But it is well to remember the charge made against the style of Demosthenes by a contemporary Greek orator, and the defence offered by the best Greek critic of oratory. Aeschines reproached the diction of Demosthenes with excess of elaboration and adornment (*περιεργία*). Dionysius, in reply, admits that Demosthenes does at times depart from simplicity,—that his style is sometimes elaborately ornate and remote from the ordinary usage. But, he adds, Demosthenes adopts this manner where it is justified by the elevation of his theme. The remark may serve to remind us of our modern disadvantage for a full appreciation of Demosthenes. The old world felt, as we do, his moral and mental greatness, his fire, his self devotion, his insight. But it felt also, as we can never feel, the versatile perfection of his skill. This it was that made Demosthenes unique to the ancients. The ardent patriot, the far-seeing statesman, were united in his person with the consummate and unapproachable artist. Dionysius devoted two special treatises to Demosthenes,—one on his language and style (*λεκτικός τόπος*), the other on his treatment of subject-matter (*πραγματικός τόπος*). The latter is lost. The former is one of the best essays in literary criticism which antiquity has bequeathed to us. The idea which it works out is that Demosthenes has perfected Greek prose by fusing in a glorious harmony the elements which had hitherto belonged to separate types. The austere dignity of Antiphon, the plain elegance of Lysias, the smooth and balanced finish of that middle or normal character which is represented by Isocrates, have come together in Demosthenes. Nor is this all. In each species he excels the specialists. He surpasses the school of Antiphon in perspicuity, the school of Lysias in verve, the school of Isocrates in variety, in felicity, in symmetry, in pathos, in power.

Literary History of Demosthenes.—The ancient fame of Demosthenes as an orator can be compared only with the fame of Homer as a poet. Cicero, with generous appreciation, recognizes Demosthenes as the standard of perfection. Dionysius, the closest and most penetrating of his ancient critics, exhausts the language of admiration in showing how Demosthenes united and elevated whatever had been best in earlier masters of the Greek idiom. Hermogenes, in his works on rhetoric, refers to Demosthenes as *ὁ ῥήτωρ*, the orator. The writer of the treatise *On Sublimity* knows no heights loftier than those to which Demosthenes has risen. From his own younger contemporaries, Aristotle and Theophrastus, who founded their theory of rhetoric in large part on his practice, down to the latest Byzantines, the consent of theorists, orators, antiquarians, anthologists and lexicographers offered the same unvarying homage to Demosthenes. His work busied commentators such as Xenon, Minucian, Basilicus, Aelius, Theon, Zosimus of Gaza. Arguments to his speeches were drawn up by rhetoricians so distinguished as Numenius and Libanius.

tempt was made to separate the authentic works from those spurious works which had even then become mingled with them. Philosophical schools which, like the Stoic, felt the ethical interest of Demosthenes, cared little for his language. The rhetoricians who imitated or analysed his style cared little for the criticism of his text. Their treatment of it had, indeed, a direct tendency to falsify it. It was customary to indicate by marks those passages which were especially useful for study or imitation. It then became a rhetorical exercise to recast, adapt or interweave such passages. Sopater, the commentator on Hermogenes, wrote on *μεταβολαὶ καὶ μεταρρυθμίσεις τῶν Δημοσθένους λόγων*, "adaptations or transcripts of passages in Demosthenes." Such manipulation could not but lead to interpolations or confusions in the original text. Great, too, as was the attention bestowed on the thought, sentiment and style of Demosthenes, comparatively little care was bestowed on his subject-matter. He was studied more on the moral and the formal side than on the real side. An incorrect substitution of one name for another, a reading which gave an impossible date, insertions of spurious laws or decrees, were points which few readers would stop to notice. Hence it resulted that, while Plato, Thucydides and Demosthenes were the most universally popular of the classical prose writers, the text of Demosthenes, the most widely used perhaps of all, was also the least pure. His more careful students at length made an effort to arrest the process of corruption. Editions of Demosthenes based on a critical recension, and called *Ἀττικανὰ* (*αὐτὴ γράφη*), came to be distinguished from the vulgates, or *δημοδαίε ἐκδόσεις*.

Among the extant manuscripts of Demosthenes—upwards of 170 in number—one is far superior, as a whole, to the rest. This is *Parisinus* Σ 2934, of the 10th century. A comparison of this ms with the extracts of Aelius Aristides and Harpocration from the Third Philippic favours the view that it is derived from an *Ἀττικανόν*, whereas the *δημοδαίε ἐκδόσεις*, used by Hermogenes and by the rhetoricians generally, have been the chief sources of our other manuscripts. The collation of this manuscript by Immanuel Bekker first placed the textual criticism of Demosthenes on a sound footing. Not only is this manuscript nearly free from interpolations, but it is the sole voucher for many excellent readings. Among the other mss, some of the more important are—*Marcianus* 416 F, of the 10th (or 11th) century, the basis of the Aldine edition, *Augustinus* I (N 85), derived from the last, and containing scholia to the speeches on the Crown and the Embassy, by Ulpian, with some by a younger writer, who was perhaps Moschopolus, *Parisinus*, *Antuerpiensis*—the last two comparatively free from additions. The fullest authority on the ms is J. T. Vömel, *Notitia codicum Demosthenis*, and *Prolegomena Critica* to his edition published at Halle (1856-57), pp. 175-178.

The extant scholia on Demosthenes are for the most part poor. Their staple consists of Byzantine erudition, and their value depends chiefly on what they have preserved of older criticism. They are better than usual for the *Ἡλεὶ στέφανον*, *Κατὰ Τυχοκράτους*, best for the *Ἡλεὶ παραπρεσβέτας*. The Greek commentaries ascribed to Ulpian are especially defective on the historical side, and give little essential aid. Editions—C. W. Müller, in *Orat. Att.* ii (1847-58), *Scholia Graeca in Demosthenem ex cod. aucta et emendata* (Oxon, 1851, in W. Dindorf's ed.)

1643, was made commander in chief of the Parliamentary Army in the Midlands and lord lieutenant of Warwickshire. He resigned his command after the passing of the self-denying ordinance in April 1645. At Uxbridge (1645) and at Carnbrooke (1647) Denbigh was one of the commissioners appointed to treat with the king. He supported the army in its dispute with the parliament, but he would take no part in the trial of Charles I. Under the Commonwealth Denbigh was a member of the council of state, but later he came to be regarded as a royalist. He died without issue on Nov. 28, 1675.

His titles devolved on his nephew WILLIAM FEILDING (1640–85), son and heir of his brother George (created Baron Feilding of Lecage, Viscount Callan and earl of Desmond), and the earldom of Desmond has been held by his descendants to the present day in conjunction with the earldom of Denbigh.

DENBIGH (*Dmbych*) municipal borough, market and county town of Denbighshire, Wales, on a branch of the L.M.S.R. Pop. (est. 1938) 7,663. Area 14.2 sq. mi. The name suggests an early fortification, *Dm* in *Dmbych* means a fort and the pre-Norman fort was called *Castell caled fryn yn Rhos*, or "the castle of the hard hill in Rhos." Denbigh castle was built in 1382 by Henry de Lacy, earl of Lincoln, from whom the town received its first charter. The outer wall is nearly a mile round. The castle was given to the Mortimers and to Leicester under Edward III and Elizabeth respectively. In 1645, after the defeat of Rowton Moor, Charles I. found shelter there. The castle long resisted the Parliamentarians. There are ruins of a Carmelite priory dating from the 13th century, a Bluecoat school (1514), a free grammar school (1527), an orphan girl school (funds left by Thomas Howel to the Drapers' Co. in Henry VII's reign), the town hall (built in 1572 by Robert Dudley, earl of Leicester, enlarged and restored in 1780), an unfinished church (begun by Leicester), and the old parish church of St. Marcella. The industries are mainly agricultural with a little quarrying. The borough of Denbigh has a separate commission of the peace, but no separate court of quarter sessions. Near Denbigh, at Bodolwyddan, etc., coal is worked.

DENBIGHSHIRE (*Dmbych*), a county of the north coast of Wales, made up of two linked regions, north-west and south-east. Area 668.7 sq. mi. The north-west region is bounded west by the Conwy, along the line of which the Ordovician rocks with volcanic elements to the west (see CAERNARVONSHIRE) give place to the sharp edged plateau of Silurian rocks, a part of the general Welsh plateau (see WALES). This region stretches east to the trough of the Vale of Clwyd, the west side of which is in Denbighshire, while the county has extensions up the Bodfari gap in the eastern wall of the vale (the Moel Famau range, with Moel Famau 1,820 ft.) and across the Clwyd farther up the valley. Flintshire borders it here on the east. The nucleus of Merionethshire is the fault valley through Corwen, Bala and Dolgellau, and consequently valleys opening into the main fault-valley are for the most part in the latter county. The north-west region of Denbighshire is thus mainly a dissected plateau draining eastward to the Clwyd, but with small portions draining to the Conwy on the west or to the upper Dee on the south. On the north coast between Old Colwyn and Llandudus is a detached fragment of Caernarvonshire, a fact related to a change in the course of the Cnwy stream.

series, crops up along the Vale of Clwyd and in Eglwysseg. Resting upon this the Carboniferous limestone extends from Llanyrnich, its extreme southern point, to the Cynrybrain fault, and there forks into two divisions that terminate respectively in the Great Orme's Head and in Talarogoch, and are separated from each other by the denuded shales of the Moel Famau range. In the Vale of Clwyd the limestone underlies the new red sandstone, and in the eastern division it is itself overlaid by the millstone grit of Ruabon and Minera, and by a long reach of the coal measures which, near Wrexham, are 4½ m. in breadth. Eastward of these a broad strip of the red marly beds succeeds, and between this and the Dee the ground is occupied—as in the Vale of Clwyd—by the new red rocks. The red sandstone areas form the best agricultural land. The eastern flank of the county is less sharp as it grades down to the coalfield west of the Dee. These coal measures have been extensively worked, with Rhos, Wrexham and Ruabon as centres. From the limestone below, lead, with silver and zinc ores, have been obtained. Valuable fireclays and terra-cotta marls are also taken from the coal measures about Wrexham. As in other northern counties of Wales, the whole of the lower ground is covered more or less thickly with glacial drift. On the western side of the Vale of Clwyd, at Cefn and Plas Heaton, the caves, a common feature in such limestone districts, have yielded the remains of the rhinoceros, mammoth, hippopotamus and other mammals now extinct in Britain.

Archaeology.—The period of earliest occupation of the region by man is still very doubtful. The high ground is dotted by tumuli, but only one beaker pot has been recorded. Finds of early gold and socketed axes dating from the late Bronze age are more numerous, indicating that the upper Dee valley and the Vale of Clwyd had become important lines of movement by this time. The native hill fortresses and Roman statues of later times show the importance of the North Wales coastal route. A great native hill-fortress was Dinorben (see Willoughby Gardner, "The Native Hill-forts of North Wales and their Defences," *Archaeologia Cambrensis*, vol. lxxxi part 2, Dec. 1926). It seems clear that these native fortresses protected routes, and, whatever their original date, they received much attention during the Roman period. Roman roads ran from Chester via Flint through the north of the county to St. Asaph, and thence on to Kanovium and Segontium (Caernarvon). Another line was via Ffrith and the south of the county to the Bala cleft and the Caerai station. Clawdd Coch has traces of the Romans, so also has Penygarn and Penbarras. To their period belong the inscribed Gwyntherin and Pentrefael (near Bettws-y-coed) stones. The Valle Crucis, "Elise's pillar," tells of Brochmael and the Cailleion (Chester) struggle against Aethelfrith's invading Northumbrians, A.D. 613, while Offa's dike goes back to the Merian advance. The south-east of the county includes a considerable section of this dike as well as of the smaller and parallel Watt's dike (see Fox, *Archaeologia Cambrensis*, vol. lxxx, part 1, June, 1926).

History.—After the Edwardian conquest Denbigh castle was built by Henry de Lacy, earl of Lincoln, and Ruthin castle probably by Hugh, earl of Chester. The rolls of the Court of Ruthin are complete from 1294, and are now in the National Library of Wales, Aberystwyth. Owen Glendower failed to take Ruthin in 1400. In the south-east of the county Chirk castle was founded

the great families were features of the county, which developed considerably under the Nonconformist influences of the 18th century.

Oak wood lofts and screens, a feature of southwest England, the Welsh border and Montgomeryshire, are found at Llanrwst, Grestford and Derwen Gressford and Llanrhaadr (Dyffryn Llanrwst Clwyd) have stannid glass.

Industries and Occupations.—The great extent of moorland area has confined the agricultural output of the county. A little wheat is grown in the lowlands but 12 times as much oats (1939). Turnips and swedes are also important crops. Large flocks of sheep are pastured on the hillsides, and many black cattle are reared for fattening in the midlands of England and for sale in London. Large numbers of pigs are also kept. Other industries formerly of greater importance than at present include slate quarrying, lead mining and woollen manufacture. Nantglyn prepares paving flags, Rhiwfelen (near Llangollen), slabs and slates, while good slates are also obtained at Glyn Ceiriog. There is plenty of limestone with china stone at Brynbo Cefn Rhiwabon yields sandstone (for hones) and millstone grit. The great Minera mine has produced great quantities of lead ore. Woollen manufactures centre around Llangollen and Llanstynfraid (St. Bridget's). The extensive development of coal mining in the south-east of the county in the latter half of the 19th century transformed the old world market towns of Chirk, Ruabon and Wrexham into coal mining and industrial centres. The proximity of the Lancashire and Staffordshire industrial areas ensures a market for the coal.

The development of the industrial area (south east) with its new populations and new ideas, provided a social and political contrast against the other section of Denbighshire (north-west) which remained rural and agricultural. These distinct geographical and social units illustrate the difficulty of the county as an administrative unit. The Denbighshire technical college is open to students resident in Flint and Merioneth.

Communications.—The Holyhead road to London, a one-time famous coaching route, runs down the Llangollen valley. The LMS railway (Holyhead line), with the Conway and Clwyd valleys branches, together with the lines connecting Denbigh with Ruabon (Rhiwabon), via Ruthin and Corwen, Wrexham with Connah's Quay (LNE railway) and Rhoshlanerchrugog with Glyn Ceiriog (for the Great Western and LNE railways) opened up the county.

The area of the administrative county is 668.7 sq mi, with a population (est. 1938) of 156,840. Wartime movements caused an increase of 11% in the county between Sept. 1939 and Feb. 1941. The chief towns are Colwyn Bay, Denbigh, Ruthin and Wrexham, the municipal boroughs, and Abergele, Llangollen and Llanrwst, the urban districts. There are five rural districts. The county has two parliamentary divisions. Denbighshire is in the north Wales circuit, assizes being held at Ruthin. Denbigh and Wrexham boroughs have separate commissions of the peace, but no separate quarter session courts. There are ten petty sessional divisions. The county is in the diocese of St. Asaph.

DENDERA, a village in Upper Egypt, situated in the angle of the great westward bend of the Nile opposite Kena. Here was the ancient city of Tentyra, capital of the Tentyrite nome, the sixth of Upper Egypt and the principal seat of the worship of Hathor (Aphrodite), the cow-goddess of love and joy. The temple of Hathor was built in the 1st century B.C., being begun under the later Ptolemies and finished by Augustus, but much of the decoration is later. A great rectangular enclosure of crude bricks, measuring about 600x80 ft., contains the sacred buildings, it was entered by two stone gateways, in the north and the east sides, built by Domitian. Another smaller enclosure lies to the east with a gateway, also of the Roman period.

The temple building, which is of sandstone, measures about 200 ft. from front to back, and consists of two oblong rectangles, the foremost, placed transversely to the other, is the great hypostyle hall or pronaos, the broadest and loftiest part of the temple, measuring 135 ft. in width, and comprising about one third of the whole structure, the façade has six columns with heads of

Hathor, and the ceiling is supported by 18 great columns. The second rectangle contains a small hypostyle hall with six columns, and the sanctuary, with their subsidiary chambers. The sanctuary is surrounded by a corridor into which the chambers open, on the west side is an apartment forming a court and kiosk for the celebration of the feast of the New Year, the principal festival of Dendera. On the roof of the temple, reached by two staircases, are a pavilion and several chambers dedicated to the worship of Osiris. Inside and out the whole of the temple is covered with scenes and inscriptions in crowded characters, of ceremonial and religious import, the decoration is even carried into a remarkable series of hidden passages and chambers or crypts made in the solid walls for the reception of its most valuable treasures. North-east of the entrance is a "Birth House" for the cult of the child Harsemteu, and behind the temple a small temple of Isis, dating from the reign of Augustus. Petrie's excavation of the cemetery behind the temple enclosures revealed burials dating from the fourth dynasty onwards, the most important being *mastabas* of the period from the sixth to the 11th dynasties, many of these exhibited a peculiar degradation of the contemporary style of sculpture.

One of the zodiacs of the temple, from a chamber on the roof, was removed in 1820 to the Bibliothèque Nationale in Paris. Figures of the celebrated Cleopatra VI. occur amongst the sculptures on the exterior of the temple, but they are purely conventional, without a trace of portraiture. Horus of Edfu, the enemy of the crocodiles and hippopotami of Set, appears sometimes as the consort of Hathor of Dendera. Juvenal, in his 17th satire, takes as his text a religious riot between the Tentyrites and the neighbouring Ombites, and Sir Flinders Petrie has shown that the Ombos in question was opposite Coptos, only about 15 m. from Tentyra, where the hippopotamus sacred to Set was venerated.

DENDERMONDE see TERMONDE

DENDRITE The fibrous process of a nerve-cell or neuron which conducts impulses toward the cell body. The dendrites of a given neuron differ in several ways from the axon, which is the fibrous process conducting away from the cell body. There may be several dendrites, whereas ordinarily there is but a single axon fibre, and the dendrites are usually arranged in branching form (hence the derivation of the term from the Greek word, *δένδρον*, meaning "tree").

See also NERVOUS SYSTEM, C. J. Herrick, *Neurological Foundations of Animal Behavior*.

DENE-HOLES, the name given to certain caves or excavations in England, popularly but incorrectly attributed to the Danes. The word however is probably derived from the Anglo-Saxon *den*, a hole or valley. There are many underground excavations in the chalk districts of the south of England, but true deneholes are found chiefly in those parts of Kent and Essex along the lower banks of the Thames.

The general outline is invariably the same. The entrance is a vertical shaft, some 3 ft. in diameter, falling sometimes to a depth of 60 ft. The depth is regulated by the depth of the chalk from the surface, but although chalk could have been obtained close at hand within a few feet, or even inches, from the surface, a depth of from 45 to 80 ft., or more, is a characteristic feature. The shaft, when the chalk is reached, widens out into a domed chamber with a roof of chalk some 3 ft. thick. The walls frequently contract somewhat as they approach the floor. As a rule there is only one chamber, from 16 to 18 ft. in height, beneath each shaft. From this excessive height it has been inferred that the caves were not primarily intended for habitations or even hiding places. In some cases the chamber is extended, the roof being supported by pillars of chalk left standing. In a rare specimen of a twin chamber discovered at Gravesend, the one entrance served for both caves, although a separate aperture connected them on the floor level. Where galleries are found connecting the chambers, forming a bewildering labyrinth, they are usually the work of a people of a much later period than that of the chambers.

Isolated specimens have been discovered in various parts of Kent, Essex, Hants and Berks, but the most important groups are at Grays Thurrock, in the districts of Woolwich, Abbey Wood and

Bexley and Gravesend. Some of the Chislehurst caves may have been begun as dene holes, but if so, they have been so enlarged and altered that their original character has been obliterated.

The tool work on the roof or ceiling is generally rougher than that on the walls, where an upright position could be maintained. Casts taken of some of the pick holes near the roof show that, in all probability they were made by bone or horn picks. And numerous bone picks have been discovered in Essex and Kent. These pick holes have assisted in fixing the date of their formation to pre-Roman times. Very few relics of archaeological value have been discovered in any of the known dene holes, to assist in fixing the date or determining their uses. Piny mentions pits sunk to a depth of a hundred feet, "where they branched out like the veins of mines." This has been used in support of the explanation that dene holes were wells sunk for the extraction of chalk. Chretien de Troyes has a passage on underground caves in Britain which may refer to dene holes, and tradition of the 14th century treated the dene-holes of Grays as the fabled gold mines of Cynobeline (or Cymbeline) of the 1st century. Vortigern's caves at Margate are possibly dene holes adapted by later peoples to other purposes, and excellent examples of various pick holes may be seen on different parts of the walls. Local tradition associates these caves with smugglers, and since illicit trade was common both on the coast and in the Thames up to Barking Creek, the theory is tenable.

There are three purposes for which dene-holes may originally have been excavated, (a) as hiding places or dwellings, (b) as draw-wells for the extraction of chalk for agricultural uses, and (c) as store houses for grain. It is unlikely that they were used as habitations, although they may have been used occasionally as hiding-places. Against the theory that they were primarily designed for the extraction of chalk, it may be urged that chalk could have been obtained on the surface close by, and that known examples of chalk draw wells do not descend to so great a depth. The discovery of a shallow dene-hole, about 14 ft below the surface, at Stone, negates this theory still further. The view that these prehistoric excavations were designed as silos is usually accepted as the most probable. Silos, or underground storehouses, are well known in the south of Europe and Morocco. It is supposed that the grain was stored in the ear and carefully protected from damp by straw. A curious smoothness of the roof of one of the chambers of the Gravesend twin-chamber dene hole supports this theory. The theory that the excavations were made in order to get flints for implements is quite impossible, as a careful examination of a few examples will show.

See F. C. J. Spurrell, "Deneholes and Artificial Caves" in the *Archaeological Journal* (1882), T. V. Holmes, "Deneholes" (1884) and many other references in the *Essex Naturalist*, *Archaeologia Cantiana* (vol. xviii, 1896), F. W. Reader, "Deneholes" in *Old Essex*, ed. A. C. Kelway (1908), W. Johnston, *Folk Memory* (1908) with bibliography.

DENHAM, DIXON (1786–1828), English traveller in central Africa, was born in London. He served in the campaigns in Portugal, Spain, France and Belgium, and received the Waterloo medal. In 1821 he volunteered to join Dr. Oudney and Hugh Clapperton (q.v.), who had been sent by the British government via Tripoli to the central Sudan. He joined the expedition at Murzuk in Fezzan. The pasha of Tripoli did not at first provide the promised escort, but the expedition eventually left Murzuk at the end of 1822. Thence it made its way across the Sahara to Bornu, reached in Feb. 1823. Here Denham, against the wish of Oudney and Clapperton, accompanied a slave-raiding expedition into the Mandara highlands south of Bornu. The raiders were defeated, and Denham barely escaped with his life. When Oudney and Clapperton set out, Dec. 1823, for the Hausa states, Denham remained behind. He explored the western, south and southeastern shores of Lake Chad, and the lower courses of the rivers Waube, Logone and Shari. In Aug. 1824 he returned to England. He had just been appointed governor of Sierra Leone when he died of fever at Freetown on May 8, 1828.

See *Narrative of Travels and Discoveries in Northern and Central Africa in the Years 1822–24* (1826), the greater part of which is written by Denham, Dr. Robert Brown, *The Story of Africa*, vol. 1 chap. xiii (1892).

DENHAM, SIR JOHN (1615–1669), English poet, only son of Sir John Denham, lord chief baron of the exchequer in Ireland, was born in Dublin, entered at Trinity College, Oxford, in 1631, and at Lincoln's Inn in 1634. His first work was *The Destruction of Troy*, a verse paraphrase, written in 1636, of the second book of the *Aeneid*, but he made his reputation with *The Sophy*, a tragedy acted at Blackfriars in 1641, and printed in 1642. In the latter year appeared the famous descriptive poem of "Cooper's Hill," which Dryden called "the exact standard of good writing," and Pope used as a model for *Windsor Forest*. Denham fought on the king's side in the Civil War, and in 1648 had to leave England when it was suspected that he was concerned in forwarding Charles's correspondence. He remained abroad in the service of the exiled court until 1652, when he returned to England. He was for some time the guest of the earl of Pembroke at Wilton, and then obtained leave to settle at Bury St. Edmunds. At the Restoration he was rewarded with the office of surveyor-general of works. A scandal, caused by the behaviour of his second wife, who became the duke of York's mistress, is said to have driven him mad, but he recovered and survived her for two years. Some satires on the conduct of the Dutch wars, *Directions to a Painter*, and *Fresh Directions* are also attributed to him. His beautiful elegy on Abraham Cowley dates from 1667.

BIBLIOGRAPHY—His *Poems and Translations*, with a dedicatory epistle to Charles II, appeared in 1668. Other editions followed, and they are reprinted in Chalmers' (1810) and other collections of the English poets. His political satires were printed with some of Rochester's and Marvell's in *Bibliotheca curiosa*, vol. 1 (Edinburgh, 1885). See *Cambridge History of English Literature*, vol. viii, ch. iii, by A. Hamilton, *Writers of the Seventeenth Century*.

DENHARDT, KLEMENS (1852–1929) and his brother GUSTAV (1856–1917), German explorers, were born at Zeitz. In 1878 they explored the Tana river, and six years later were able to negotiate a friendly treaty with the sultan of Witu. Part of the territory acquired was sold to the German Witu-Gesellschaft and was later given to England in exchange for Heligoland.

DENIA, a town in east Spain in Alicante province, on the Mediterranean sea and on the coast-railway from Carcagente to Alicante. Pop. (1940) 7,637 (mun. 12,323). Denia, built on the seaward slopes of a small hill surmounted by a ruined castle, lies between the limestone ridge of Mongo on the south and a fertile plain on the north.

Denia makes soap, jam, nails, bicycles and woollen, linen and esparto fabrics but is above all a fruit port. It exports grapes, raisins, melons and oranges, tomatoes, onions and almonds, usually to Great Britain and north Europe and imports wheat, flour, guano, sulphur, from Italy, Baltic timber, and coal and tin-plates from South Wales. The harbour, sheltered by a breakwater, contains only a small area of deep anchorage and quay accommodation is limited to boats of under 12 ft draught. Vessels therefore

load and discharge chiefly into lighters, the larger boats anchoring in the open roadstead about 1 mi from the shore. Throughout the civil war of 1936-39, the port remained in loyalist control.

Denia was colonized by Greek merchants from Emporiae (Ampurias in Catalonia), or Massilia (Marseille), at a very early date, the Romans named the town *Dunum*, after its temple of Diana, built, in imitation of that at Ephesus, at the foot of the castle hill. Denia was captured by the Moors in 713, and according to an ancient but questionable tradition, under them became so prosperous a trading centre that its population rose to 50,000. Many characteristic Moorish houses survive in the town though it has been largely modernized. After the city was retaken by the Christians in 1253, its prosperity dwindled, and only began to revive in the 19th century. During the War of the Spanish Succession (1701-14), Denia was thrice besieged, and in 1813 the French withstood an allied British and Spanish siege of the citadel for five months before surrendering, on honourable terms.

DENIFLE, HEINRICH SEUSE (1844-1905), Austrian historian and priest, was born on Jan 16, 1844, at Imst. After becoming a Dominican in 1861, he studied at Graz, Rome and Marseille, and then from 1870 to 1880 taught philosophy and theology at Graz. Ten years after his first important work, *Das geistliche Leben. Eine Blumenlese aus den deutschen Mystikern des 14. Jahrhunderts*, Denifle became in 1883 subarchivist of the Vatican. Then came a series of erudite works which have revolutionized our knowledge of the middle ages. In 1885 appeared *Die Universitäten des Mittelalters bis 1400*, in 1889-97 the edition (together with Chatelain) of *Charitativum Univ. Paris*, in 1894-97 *Liber Procuratorum Nationis Anglicanae 1333-46*, in 1898 *Specimina palaeographica Regestorum Pontificum ab Innocentio III. ad Urbanum V.*, in 1899 *La guerre de cent ans et la désolation des églises, monastères, et hôpitaux, t. I. jusqu'à la mort de Chas. V. (1385)*, in 1897 *La désolation des églises, monastères, hôpitaux, en France vers le milieu du XIV^e siècle* (based on some 1,300 documents). The publication in 1904 of *Luther u. Luthertum*, based on original documents, was followed in the same year by *Luther in rationalistischer u. christlicher Beleuchtung*, a reply to the defense of Luther by Harnack and Seeberg, and by a second volume posthumously in 1909. Besides short articles on various mediaeval mystics, in 1885 Denifle together with Ehrle founded the invaluable *Archiv f. Lit. u. Kirchengeschichte des Mittelalters*.

DENIKER, JOSEPH (1852-1918), French naturalist and anthropologist, was born at Astrakhan, Russia. He studied at St Petersburg (Leningrad) and, as an engineer, travelled extensively in the petroleum districts of the Caucasus, in central Europe, Italy and Dalmatia. In 1888 he was appointed chief librarian of the Natural History museum, Paris. His valuable ethnological works include *Recherches anatomiques et embryologiques sur les singes anthropoïdes* (1886), *Étude sur les Kalouks* (1883), *Les Ghilaks* (1883), and *Races et peuples de la terre* (1900, Eng. trans. 1900, 2nd ed. 1926). He was one of the editors of the *Dictionnaire de géographie universelle*. He died in Paris on March 18, 1918.

DENIKIN, ANTON IVANOVICH (1872-1947), Russian general, was born in humble circumstances on Dec. 4, 1872. During the Russo-Japanese War he rose from captain to colonel, and in World War I became commander in chief of the southwestern front. After the Revolution he followed Lavr G. Kornilov and was arrested and imprisoned with him in Bykov. They escaped together and joined Mikhail Alexeyev, who was forming in Rostov and Novocherkassk on the Don a small army of volunteers to fight the bolsheviks. After Kornilov's death on March 31, 1918, Denikin became military commander of the army, while Alexeyev retained the political and financial leadership. They established contact with the Don Cossacks under Peter Krasnov, and were further strengthened by the forces of Gen. Pokrovsky and Col. Drozdovsky. In June 1918 Denikin initiated a campaign in the northern Caucasus, by September his army had grown from 9,000 to 40,000, and by Feb. 1919 he had driven a bolshevik army of 150,000 from the northern Caucasus. Alexeyev died on Sept. 25, 1918, and early in 1919 Denikin took the name of commander in chief of the armed forces of South Russia.

In the autumn of 1919 Denikin came within measurable distance of complete victory. His forces had grown to 150,000, Kharkov, Poltava, Odessa, Kiev, and Orel were in his hands, his right wing had, through a force of Ural Cossacks, established connection with Alexander V. Kolchak's left wing about 400,000 sq. mi. of territory had been wrested from the bolsheviks, and a South Russian government was in being, with a "special council" of 24 members. But his great military ability was not alone enough to ensure the fulfilment of Denikin's aims. The rapid turn in his fortunes from victory to defeat was due to a complexity of causes, prominent among which were the general political bewilderment and diversity of purpose manifested by his supporters both within and without the boundaries of the former Russian empire, and the consequent difficulty of maintaining the effective morale of his armies. Meanwhile, largely owing to the relentless discipline introduced by Lev D. Trotsky, the bolshevik resistance had stiffened. At the beginning of Nov. 1919 Simeon M. Budennyi's cavalry broke through the "white" lines at Kuv yansk and a general retreat set in. By promising a new government on federal lines Denikin made a final, but fruitless, attempt to weld the various Cossack units into cohesion.

Early in 1920 the bolshevik army retook Rostov and Ekaterinodar. Denikin, in face of great difficulties, transferred his army from Novorossiysk to the Crimea, and shortly afterwards resigned his command to Gen. Peter Wrangel and retired to England. He died on Aug. 8, 1947, at Ann Arbor, Mich.

DENIM, the name originally given to a kind of serge. It is now applied to a stout twilled cloth made in various colours usually of cotton, and used for overalls, etc.

DENINA, CARLO GIOVANNI MARIA (1731-1813) Italian historian, was born at Revello, Piedmont, in 1731, and was educated at Saluzzo and Turin. He was professor of humanity and rhetoric in the college of Turin. His most important work is *Delle rivoluzioni d'Italia* (1769-72). In 1782, at Frederick the Great's invitation, he went to Berlin, where he published his *Vie et règne de Frédéric II* (1788) and *La Prusse littéraire sous Frédéric II*, 3 vols. (1790-91). His *Delle rivoluzioni della Germania* was published at Florence in 1804, in the same year he went to Paris as the imperial librarian, on the invitation of Napoleon. He died in Paris on Dec. 5, 1813.

DENIS (DIONYSIUS), SAINT, first bishop of Paris, patron saint of France, whose feast is celebrated on Oct. 9. According to Gregory of Tours (*Hist. Franc.*, i, 30), he was sent into Gaul at the time of the emperor Decius. He suffered martyrdom at the village of Catulliacus, the modern St. Denis. His tomb was situated by the side of the Roman road, where rose the priory of St. Denis de l'Estree, which existed until the 18th century. In the 5th century a basilica was built over the tomb. About 625 Dagobert, son of Clothar II, founded a monastery in honour of St. Denis near by where the greater number of the kings of France have been buried. A false interpretation of Gregory of Tours, apparently dating from 724, represented St. Denis as receiving his mission from Pope Clement, and as having suffered martyrdom under Domitian (81-96). Hilduin, abbot of St. Denis in the first half of the 9th century, wrongly identified Denis of Paris with Denis (Dionysius) the Areopagite. St. Denis is generally represented carrying his head in his hands.

See *Acta Sanctorum*, Octobris, iv, 696-987, Chevalier, *Bio-bibliog.*, J. Havel, *Les Origines de Saint-Denis*, in his collected works, i, 191-246 (Paris, 1896).

DENIS, MAURICE (1870-1943), French painter, born at Granville, France, on Nov. 25, 1870. The guiding influence in his artistic development was the work of Gauguin, and he joined with some fellow students, all admirers of Gauguin, to form the group known as "Symbolists." Among them were Serusier, Vuillard, Bonnard and X. Roussel. Denis was also attracted to the pointillism of Seurat, as is shown by his use of pure pigments and of the juxtaposition of complementary colours in his pictures. He then devoted himself to decorative painting, following the example of the great Italian fresco painters of the 15th century. His most remarkable works are in the sphere of religious art, and mural decorations of this kind are to be seen in the churches of Le

Vésinet and of St. Paul at Geneva and in the priory chapel at St. Germain en Laye. Dennis decorated the ceiling of the Champs Elysées theatre Paris and also illustrated numerous works including a translation of the *Little Flowers of St. Francis*. He published *Theories*, 1896-1910. *Du Symbolisme et de l'Art moderne*, 1912. *Nouvelles théories sur l'art moderne*, 1914-21. *Aristide Maillol* (1925). *Charmes et leçons de l'Italie* (1935). and *L'Histoire de l'Art Religieux* (1939). He died in Paris, Nov. 13, 1943.

DENIS, MICHAEL (1729-1800), Austrian poet, was born at Scharding, on the Inn on Sept. 17, 1729. He was brought up by the Jesuits, entered their order, and in 1759 was appointed professor in the Theresianum in Vienna. In 1784, after the suppression of the college, he was made second custodian of the court library, and seven years later became chief librarian. He died on Sept. 29, 1800. Denis is best remembered as the translator of *Ossian* (1768-69), also published with his own poems in 5 vols. as *Ossians and Sineds Lieder*, 1, 84). His *Sammlung kurzer Gedichte aus den neuern Dichtern Deutschlands*, 3 vols. (1762-66), introduced current North German literature to Austrian readers.

A selection of his poetry edited by R. Hamel will be found in vol. 48 of *Kürschner's Deutsche Nationalbibliothek* (1884). His *Literarischer Nachlass* was published by J. F. von Retzer in 1802 (2 vols.) See P. von Hofmann-Wellenhof, *Michael Denis* (1881).

DENISON, GEORGE TAYLOR (1839-1925), Canadian soldier and publicist was born in Toronto on Aug. 31, 1839, and died there on June 6, 1925. In 1861 he was called to the bar. He saw active service during the Fenian raid of 1866, and during the rebellion of 1885. In 1877 he was appointed police magistrate of Toronto. Col. Denison was one of the founders of the "Canada First" party. He was a member of the Royal Society of Canada and was president of the section dealing with English history and literature. His best known military work is the *History of Modern Cavalry* (1877) which was awarded first prize by the Russian government in an open competition and has been translated into German, Russian and Japanese. In 1900 he published his reminiscences under the title of *Soldiering in Canada*.

DENISON, a city of Grayson county, Tex., U.S., 75 mi. N.E. of Dallas and 4 mi. from the Red river. It is on federal highways 75 and 69 and is served by the Frisco, the Kansas, Oklahoma and Gulf, the Missouri-Kansas Texas, the Southern Pacific and the Texas and Pacific railways. Pop. (1950) 17,444. It is an important railway centre.

The manufacturing industries include freight-car construction shops, bridge works, planing mills, cotton textile mills, a large peanut plant, a wood preserving plant, and plants manufacturing food products, machinery, clothing, boats, furniture, livestock feed etc.

The \$60,000,000 Denison dam on the Red river forms a large artificial lake, Lake Texoma. Denison was settled by northerners in 1872 when the Missouri, Kansas and Texas railway reached this point, and was named after George Denison, a director of the railway. It was incorporated as a city in 1891.

DENIZEN, a dweller, a stranger admitted to certain rights in a foreign country, in England an alien who obtains by letters patent (*ex donatione regis*) privileges of a British subject. By 22 and 3, Will. 3. Cl. 2. a denizen unless born of English parents (אזרח) is not a member of the privy council or of parliament and holds no civil or military office or trust or takes an oath and joins the crown. The British Nationality Act, 1948 provides that nothing therein contained shall affect the right of any alien to denizenship by the statute.

DENIZLIK, chief town of a village of the same name of Turkey (anc. *Lada* or *Lada*), altitude 1,161 ft. Pop. (1950) 2,009. It is beautifully situated at the foot of Balıkdag (Mt. S. bacus) one of the tributaries of the Çukurova (Lycaon) and is connected by a branch line with the station of Gönclü on the Smyrna-Direkt railway. It took the place of Iodicea when this town was deserted during the wars between the Byzantines and Seljuk Turk, probably between 1158 and 1174. It had become the Muslim city in the 13th century and was the chief Lidi, being famous for its cotton and embroidered products of its Greek inhabitants. The delightful gardens of Denizli have obtained for it the name of the "Damascus of Anatolia".

DENMAN, THOMAS, 1st BARON (1779-1854) English judge, was born in London, the son of a well known physician on July 23, 1779. He was educated at Eton and St. John's college, Cambridge, where he graduated in 1800. He then married, and in 1806 he was called to the bar at Lincoln's Inn. In a few years he attained a position at the bar second only to that of Brougham and Scarlett (Lord Abinger). He distinguished himself by his eloquent defence of the Luddites, but his most brilliant appearance was one of the counsel for Queen Caroline for whom he made a great speech before the lords which gained him the enmity of the king and retarded his career. At the general election of 1818 he was returned M.P. for Wareham in the Whig interest. In the following year he was returned for Nottingham for which place he continued to sit till his elevation to the bench in 1832. In 1832 he was appointed common sergeant by the corporation of London. In 1830 he was made attorney general under Lord Grey's administration. Two years later he was made lord chief justice, and in 1834 he was raised to the peerage. As a judge he is most celebrated for his decision in the important privilege case of *Stockdale v. Hansard* (9 Ad. and El. 1, 11 Ad. and El. 253), but he was never ranked as a profound lawyer. In 1830 he resigned his chief justiceship and retired into private life.

The Hon. GEORGE DENMAN (1819-96), his fourth son, was also a distinguished lawyer and a judge of the Queen's bench from 1872 till his death in 1896.

See *Memoir of Thomas, first Lord Denman*, by Sir Joseph Arnould (1873), E. Manson, *Builders of our Law* (1904).

DENMARK (DANMARK), a kingdom of Europe, occupying part of the peninsula of Jutland (Jylland) and a group of islands dividing the Baltic and North seas and lying, except for the island of Bornholm, between lat. 54° 33' and 57° 45' N. and between long. 8° 5' and 12° 47' E. The southern part of the peninsula (Schleswig-Holstein) belongs to Germany. The northern extremity of the Danish part is actually insular, being separated from the mainland by the narrow and shallow Limfjord, which connects the North sea with the Kattegat (though broadest in the west, its connection with the North sea dates from 1825 only). The Skagerrak bounds Jutland on the north and northwest. Between the Kattegat and the Baltic and between the base of the peninsula and southwestern Sweden lie the Danish islands. Of the total area of the kingdom (18,575 sq. mi.), Jutland covers 11,411 and the islands in the Baltic 5,136 sq. mi. The latter comprise the two large islands, Fyn (Funen) and Zealand with smaller islands, chiefly on their south sides, and Bornholm far to the east in the Baltic.

Physiography—The solid geology is almost everywhere obscured by deposits of boulder clay lying generally on Cretaceous rocks, of which there are outcrops for example in Moen and Aalborg. Much of the Danish chalk, including the well known limestone of Faxe, belongs to the highest or "Danian" subdivision of the Cretaceous period. In the southwest a succession of strata, including lignite formations, intervenes between the chalk and the boulder clay. It is on the island of Bornholm only that older formations come to light. This island compares rather with southern Sweden and forms in fact the southernmost portion of the Scandinavian system, boulder clay is absent in the southwest of the island where Cumbrian, Silurian, Jurassic and Cretaceous formations appear. Some parts of Denmark are supposed to have been raised out of the sea toward the end of the Cretaceous period and may have been above water in various subsequent periods, but the first emergence was during the formation of the Ancylus lake (in the time of the Ice Age). Research greatly enlarged knowledge of the Pleistocene glaciation in its relation to early man, and its phases in the Baltic area were correlated with the stages observed in the Alps. Successive layers of trees preserved among peat in certain small depressions found in many of the forests of Denmark show that the flora has undergone remarkable variations to be connected with changes of climate during and since the glacial epoch. The first pine forests replaced a tundra flora during the period of the Ancylus lake, a fresh water inland

sea caused by a phase of elevation in the area now occupied by the Baltic. Before the disappearance of the lake there followed a still milder climate with oak forests, and a later cooler and moister phase is represented by the beech forests so widely distributed in modern Denmark, which apparently spread in the late Bronze and early Iron Age. It is to the Gothi-glacial and to the preceding Daniglacial retreats (equated by many respectively with the Achen and Laufer oscillations in the Alps), that the country owes its covering of moraine deposits.

The surface of the country is uniformly low, the highest ground culminating in Yding Skov høj in southeastern Jutland, which is but 565 ft. above the sea. There are, however, numerous hills between 300 and 500 ft. in height. Undulating moraine formations of fertile clay, the legacy of the Pleistocene glaciation, are commonest in Zealand, Fyn and east Jutland, where they form the basis of Denmark's most characteristic landscapes of rich cornfields, meadows and beech woods. Extensive plains are in the west, consisting of poor sandy soils washed from the western edge of an ice sheet which lay from north to south down the peninsula. These wide expanses of heather covered sands are broken here and there by moraine formations of an earlier glacial phase. They were reclaimed for forest or arable land to the extent of nearly 5,000 sq. km. The dune islands and dunes form an almost continuous line along the west coast of Jutland from Blaaevands Huk to the Skaw. The dunes did great damage up to the end of the 19th century by drifting in over the cultivated areas and even destroying settlements, but later they were largely planted and secured by means of groynes.

Jutland and Fyn—Bordered by these sparsely peopled dunes with a coast dangerous to shipping, the peninsula of Jutland (Jylland) may be said to turn its back on the North sea; its life has tended to orientate itself toward the islands where Copenhagen provides a metropolitan centre that contains, with Fredensborg and Gentofte, 21% of the total population of the country. Esbjerg, which has a large fleet of fishing vessels and daily steamship services to England and France, is the only harbour on the western coast, but new harbours were constructed in the north at Hirtshals and Hanstholm. The drainage of the peninsula is typical of a low glaciated region. The Varde, Omme, Skjerne, Stor and Karup, sluggish and tortuous streams, flow through marshy tracts into the lagoons of the western coast, while the eastern Limfjord is flanked by the swamps known as Vildmose. The country's largest river, the Gudenaa, 80 mi. in length, rises near the eastern coast and drains the Silkeborg series of lakes, following a winding course into Randers fjord (Cattegat). Off South Jutland (North Schleswig) is the island of Als in the Little Belt. Fyn, the main western island, is separated from the peninsula by the Little Belt, varying in width from ten miles to the one-half mile strait which lies between the resort of Middelfart and the port of Fredericia, in Jutland. In form roughly oval, with a length from northwest to southeast of 53 mi., and an area of 1,149 sq. mi., Fyn is closely allied to the mainland, and its fertile meadows among patches of woodland and boulder strewn hills are typically Danish. An archipelago, which includes Taasinge, Avernakø and Drejø, lies to the south, enclosed by the narrow islands of Aero (16 mi. in length) and Langeland (32 mi.).

Zealand (Sjælland)—The largest island in the kingdom, Zealand lies east of Fyn, from which it is separated by the Great Belt, 11 mi. wide in its narrowest part. It is 82 mi. from north to south and 68 mi. from east to west, but the outline is very irregular. The area is 2,708 sq. mi. On the north lies the Cattegat, on the east the Sound, narrowing to 3 mi. off Elsinore, and on the south the straits through which come the islands of Moen, Falster and Lolland. The undulating surface is little above sea level, save that the Cretaceous hills of the southeast, especially in Moen, reach heights of more than 300 ft. Of numerous coastal indentations the most important is the Ise fjord on the north, with its eastern and western branches, the Roskilde and the Lammefjords, penetrating about 25 mi. inland. Small lakes among the glacial debris are common here as elsewhere in Denmark, those of Arre and Esrom in the northeast attaining notable dimensions.

Climate—The climate is milder than that of most countries in

the same latitude, for it is profoundly modified by maritime influences. No part of the land is more than 10 mi. from the open sea, while numerous indentations carry equable conditions, and their effect is noticeable on the monthly weather maps. The mean annual temperature is 45° F., the average for July is about 61° and for January about 32° F. Frost occurs on an average on 20 days in each of the months from December to March. The eastern coasts are ice fringed for some time, and both the Sound and the Great Belt are very occasionally impassable on account of ice. Variable winds (mainly west and southwest) of cyclonic origin lead to considerable variations from day to day, especially in the winter months. The average annual rainfall is about 24 in., showing a tendency toward a maximum from July to November. The wettest month is August (3.12 in.) and February (3.34 in.) is the driest. Thunderstorms are frequent in summer. At that season rainfall is greatest in central Jutland where the higher ground produces an increase throughout the year, more rain falls in the east of the kingdom than in the west. The reverse is true of the distribution of winter rain. The most equable climate occurs on the North sea coast, where temperature ranges marking the higher ground of central Jutland and the interior of Zealand. For the most part, climate combines with location and soil conditions in making Denmark an essentially agricultural and pastoral land.

Flora and Fauna—The flora of Denmark is surprisingly varied. The ordinary forms of northern Europe grow freely in the islands and on the eastern coast, while the heaths and sand hills of the Atlantic side have a number of distinctive species. The native Danish forest is almost exclusively made up of beech, but it comprises only one third of the whole timbered area; extensive coniferous plantations having been made. The latter, however, are confined for the most part to Jutland, so that the beech remains characteristic of the landscape in the islands. The oak and ash are now rare, in the first half of the 17th century the oak was still the characteristic Danish tree. Large oak forests have been planted. Abundant traces of ancient extensive forests of fir and pine are found. Numerous peat bogs with remains of trees supply a large proportion of the fuel locally used. In Bornholm the flora is more like that of Sweden, not the beech, but the pine, birch and ash are the most abundant trees.

The wild animals and birds of Denmark are those of the rest of central Europe. The larger quadrupeds are all extinct. The sea fisheries are important. Oysters are found, but have disappeared from many localities where their abundance in ancient times is proved by their shell mounds on the coast. Salmon are found in some rivers of Jutland. (E. E. E., H. L. N.)

HISTORY

The first trustworthy written evidence of a kingdom of Denmark belongs to the beginning of the Viking period. Everything before that is prehistory. Roman knowledge of this remote country was fragmentary and unreliable, and the traditional accounts in *Widsith* and *Beowulf* and by later Scandinavian writers, notably Sivo Grammaticus (c. 1200), are so much mythological and legendary to serve as history. Archaeology and the study of place names, however, provide a certain amount of information about the earliest settlements.

After the first nomadic hunters, before 10,000 B.C., a Stone Age culture developed which culminated in the megalithic culture c. 2000 B.C. There was then a cultural break so violent that we must suppose the settled agriculturalists to have been displaced by newcomers, that is by the Single Grave people who eventually took possession of central Denmark. Apart from minor immigrations later the country seems at this time to have received its permanent population, though not to have been finally settled. The refined culture of the ruling class in the Bronze Age (c. 1500-400 B.C.) and the poor peasant culture of the earliest Iron Age were developed mainly in the old settlements, but in the centuries around the beginning of the Christian era of colonization seems to have been completely reorganized. The old habitations round the small primitive field systems (dikes) were abandoned for the earliest of existing villages with the characteristic round endings

unge, lase, sted and um

The open field system with its long ridged strips was probably introduced at the same time. The period of the great migrations, the dimmest in Danish history, was a period of war and unrest, probably at this time the whole country was conquered by Danes from the east. There are glimpses of a tribal organization as associated with local things (arbitrating assemblies) but no trace of comprehensive government. Place names indicate belief in the pagan gods, e.g., Njord and Freyja. Tyr and Odin.

The Viking Period (800-1050)—The northward extension of Charlemagne's dominion brought Denmark into close connection with Europe. The Frankish conquests were halted by the Danish king Gudfred and a solemn treaty on the Eider in 811 made this river the frontier, and it remained the southern frontier of Denmark until 1864. Gudfred may have ruled over all Denmark, but the centre of gravity, was in the extreme south of the Jutland peninsula. Here Hedeby, on the Schlei, became an important station on the new Frankish trade route to the Arabs via Friesland, the Baltic sea and the Russian rivers. To protect this vital border land a great rampart, the Dannevirke, was erected, but it failed to prevent temporary Swedish and German conquests. The Danes took an active part in this trade together with the Frisians, at the same time Danish and other Scandinavian Vikings began the expeditions of plunder and conquest (see **Viking**) that resulted in the Viking kingdoms in Friesland, England, France and Russia. Immediately after Gudfred's death in 810 the kingdom was dissolved. Various dynasties contended for power and appealed one after another to the Frankish rulers, who sought moreover to bring about a Frankish infiltration into Scandinavia by mission aries—notably Ansgar, the "apostle of the North"—though with out lasting result.

In the 10th century a new royal line, centred at Jelling (North Jutland), succeeded at last in uniting the kingdom. The name of the kingdom occurs for the first time on Danish soil in runic inscriptions on the Jelling stones. The self glorifying phrase "Denmark's repair" (*Danmarks bød*) used by King Gorm may refer to the reconquest of the Hedeby region, while Gorm's son Harald Bluetooth (Harald Blaatand) boasts of having completed the country's unification, converted the Danes to Christianity and conquered Norway.

The words correspond to reality. After Harald's baptism his father's pagan tomb was turned into a Christian construction with a church between two great mounds, and the newly appointed Jutland bishops, under the archbishop of Hamburg, organized the country's Christianization. The expansion begun by Harald in Norway was continued by his son the Viking king Sweyn I Forkbeard (Svend Tveskæg), who conquered England in 1013. Under Sweyn's son Canute the Great (Knud) there grew up a great Anglo-Scandinavian kingdom that included parts of Sweden.

Numerous runic inscriptions show that, over the broad peasant population there was a class of chieftains (*thegner* and *drengs*), which sought fame through warlike exploits and foreign expeditions. Wealth and power distinguished this aristocratic Viking community, the circular encampments of Trelleborg, Aggersborg and Fyrkat (excavated from 1934), astonishing in size and in mathematical construction, testify to high technical culture and great organizational talent.

The Kingdom of the Valdemars (1050-1241)—Shortly after the death of Canute (1035) his great kingdom was dissolved. Denmark again became a purely Scandinavian power, for a time under Norwegian rule, until Canute's nephew Sweyn II Estrithson (Svend Estridsen) founded a new Danish kingdom on European lines and in close association with the Roman Church. His five sons who followed him in turn (1074-1134), ruled according to varying principles: some adhered to the traditional constitutional practice of a weak monarchy in sympathy with the aristocracy, others, opposing the aristocracy but in close association with the church, sought to create a powerful and centralized monarchy. At this time the church which for a period had been under strong Anglo-Saxon influence, passed once more under the leadership of Hamburg and, undergoing its final process of organization, became (c. 1104) a separate national church with an archbishopric

at Lund in Skane. Canon law made slow progress and never became absolute in Danish ecclesiastical law. The partial introduction of tithes soon caused kings and nobles to vie with the peasants in building Romanesque stone churches in nearly every parish, some of them new ones and some replacements of wooden buildings.

The reigns of Sweyn's sons were followed by disintegration and internal strife among their many heirs. For a time the country was split up into minor kingdoms, weak kings took their land in fief from the Holy Roman emperor, and the new Scandinavian church was reverting to the primacy of Hamburg. But unity and independence were restored, first in the ecclesiastical field under Archbishop Eskil, a great founder of monasteries and persistent champion of Gregorian ideas, and later (1157) in the national, when Valdemar I (1157-1201) had defeated his rivals. In close association with Absalon (bishop of Roskilde, 1158, archbishop 1177-1201), who was inspired by French monarchical ideas, King Valdemar built up a powerful and expansive monarchy. Archbishop Eskil, seeing a threat to the church's freedom, went into exile, but later, after an agreement with the king, he inaugurated in a double celebration at Ringsted in 1170 the theocratic and hereditary monarchy of the Valdemars, canonizing the king's father, the duke Canute Lavard, and crowning and anointing the king's young son Canute. Soon after, he yielded the archbishopric to Absalon. Regardless of the oath of fealty to the emperor the country's military power was reorganized and in rivalry with the Germans the Danes began, after their conquest of Rugen (1169 ff.) to dominate the Slav countries of the Baltic.

After Valdemar's death (1182) Absalon rejected by force of arms the German demand for supremacy and consolidated the monarchy internally and externally. Under Valdemar II (1202-41) Baltic expansion gained impetus, and in 1214 the emperor acknowledged Danish suzerainty over the German-Slav lands north of the Elbe and the Elide, Estonia was conquered in 1219. Thus culminated Danish dominion of the Baltic. Soon after, the king having been taken prisoner by one of his German vassals, it collapsed. An attempt at reconquest of the German Baltic lands failed when the Danish army that had invaded Holstein was defeated at Bornhöved in 1227. Only Rugen and Estonia were left.

The successful establishment of a great Danish kingdom was due in part to German weakness, in part, however, to internal reasons. A rapid growth in population since the Viking period had led to vigorous internal colonization, successions of new villages had occupied the space between the old ones, new towns had grown up and rising exports of agricultural goods and herring from Skane gave increased prosperity. The Valdemars rose above particularism and gained the allegiance of fresh social groups—not only that of the clergy but also that of the class of the powerful landed lords (*herremænd*) that had arisen by a fusion of the king's retainers (*hird*) with the old nobility. From this were recruited the court officials who, together with the greatly expanded chancery, were responsible for the central government, and the local officials (*ombudsmand*), who also administered the royal demesnes. The landed nobility formed a new and better equipped regular army, which increasingly took the place of the old peasant levies (*leding*). In return, the people's military obligations and services for maintaining the king were converted into fixed property taxes. Intellectual life flourished through a clergy educated at French and Italian schools. Denmark was drawing abreast of the civilized nations of Europe.

Dissolution and Consolidation (1241-1375)—The policy of conquest had overstrained the country's resources, and when the population ceased to grow there was a lack of energy with which to colonize what had been conquered. The breakdown of the expansionist policy was therefore inevitable. But the powerful monarchy had also sown the seed of internal disruption and national dismemberment. In order to hold the royal patrimony together Valdemar II had distributed large areas as feudal appanages to his younger and illegitimate sons and the extensive privileges which the autocratic monarchy had paid for the loyal support of clergy and landlords had created a huge aristocracy that soon became a dangerous rival to the throne. The eldest son,

Eric IV Plovpenning, who had long since been crowned as consort, was soon in dispute with the church and with his brothers about royal prerogatives. His brother, Duke Abel of Schleswig, proclaimed himself king and had Eric murdered (1250). He was then elected king, but when he fell fighting against rebel Frisians (1252) his sons were passed over and his brother was elected as Christopher I. Thus not only was the hereditary principle broken, but the older Abel line which continued to hold the duchy of Schleswig, became a permanent source of unrest and by its close association with Holstein, began the germination of Schleswig. A number of archbishops persisted in the church's struggle against the crown. In this nationally destructive contest the king held the upper hand. He had been forced, however, to accede to the constitutional demands of the aristocracy. In the 1350s an aristocratic national assembly (*parlamentum*) was formed, which imposed legal limits to the arbitrary rule of the monarchy. After a long constitutional struggle in which the king turned for support to a narrow privy council and to some extent to German princes and mercenaries, Eric V Glipping (1259-86) was forced to yield. The first charter (*haandfæstning*) of 1282 legalized the assembly's authority and limited the king's powers, during the next few years the nobles carried out a policy of radical reforms and reorganization. When Eric V was murdered in mysterious circumstances, the royalists seized the opportunity to regain control and had the leaders of the reform party convicted of the murder and exiled.

Eric VI Menved (1286-1320) tried to restore the power of the throne and revive expansion into German territories. But progress was only apparent. Government finances broke down, and the kingdom began to disintegrate, especially when large territories were mortgaged to raise capital.

At subsequent royal elections the discontented nobles tried to control the monarchy by strict charters, but the result was more mortgages and increasing disintegration. From the death of Eric VI's brother Christopher II (1332) to 1340 the country was without a king. Holsteiner counts ruled over and impoverished Jutland and the islands as mortgagees, while Skåne subjected itself to the Swedish king. From 1241 the tendency had been toward increasing feudalization: officials and nobles freed themselves from government bonds, and free peasants in large numbers abandoned their property rights and sought protection from the strong, which seemed to them more effective than the inefficient legal protection afforded by the monarchy.

Through the mediation of German princes and the Hanseatic league Valdemar IV (1340-75) succeeded in reaching a settlement with the Holsteiner mortgagees and obtaining recognition as king. He succeeded in reunifying the country bit by bit by alternate redemption and force of arms and crowned national recovery by reconquering Skåne in 1360. Laying great stress on national unity and fellowship, he built up a new antifeudal state. A national army was established in which burghers and peasants gained a place beside the nobles. The king's military power rested chiefly, however, on a chain of castles, under strict supervision, their officers became the leaders of local administration. The crown's finances were restored with a severe hand: the old land taxes were given a fixed money value, and new taxes and labour services were levied, but meanwhile the nucleus formed by the royal demesnes was continually increased as a royal court of law (*ret tæsting*) awarded to the crown all lands lost during the period

a condition of his return to the throne.

The Scandinavian Union (1375-1523)—The male line of the dynasty having died out with Valdemar IV, the privy council took control and elected as king young Olaf (1375-87), son of Valdemar's daughter Margaret by her marriage with King Haakon VI of Norway and heir also to the succession of Sweden (where Albert of Mecklenburg, Haakon VI's cousin, was at that time reigning). The power of the throne was limited by charter, but the real ruler was Margaret who, when first her husband and then her son died, was acknowledged in 1387 as "lady and husband" of Denmark and Norway. With wisdom and moderation she gained control over the privy council (which had taken over authority of the *parlamentum*) and ruled with the aid of private court officials. She kept a close watch over the conduct of her stewards and zealously carried out the legal restitution of the lost demesnes.

Called in by discontented Swedish nobles, Margaret expelled the Mecklenburgers from Sweden in 1389 and thus became the actual ruler of all Scandinavia (see MARGARET, queen of Denmark, Norway and Sweden). Everywhere she enforced allegiance to her elder sister's grandson, Eric, duke of Pomerania, who was crowned king of all three countries in a solemn joint act at Kalmar in 1397. An attempt was made at this assembly to establish a more permanent connection between the respective countries, but because of disagreement as to whether the government of the union should be aristocratic and constitutional or strictly monarchial the meeting seems to have been dissolved without result. The famous charter of the union of Kalmar was probably never adopted, the aristocratic constitution at least never became effective. The monarchy remained powerful and was strengthened after Margaret's death in 1412. Being childless, Eric of Pomerania (Eric VII of Denmark) arranged for a Pomeranian cousin to be designated his successor and gained acceptance of the principle that the royal castles after his death should pass to his successor directly, not via the privy council. In foreign policy Eric evidently planned to create a great Baltic state centred on Scandinavia and Pomerania, but despite the best intentions he lacked the ability to accomplish even limited Danish tasks. He wanted to recover Schleswig, which after the expiry of the male line of the Abel dynasty had in 1386 been enfeoffed to the counts of Holstein, for the crown, and he sought to weaken the commercial power of the Hanseatic league by such means as encouraging a Danish urban middle class—a policy that found expression in his edict of 1422, which reserved trades and crafts for Danish citizens. This caused the Hanseatic league to ally itself with the Holsteiners and, although the Danish navy defeated the league repeatedly in the Sound (where from c. 1420 Denmark exacted dues), Denmark was inferior on land. The burdens of war converted Swedish discontent with royal rule into open revolt, and the Danish privy council enforced a tolerable peace with the Hanseatic league and the Holsteiners in 1435 in order to apply every energy to perpetuating the union. But at a meeting at Kalmar in 1436 the Danish councillors deserted the king's union policy and supported the constitutional program of the Swedish nobles, disavowing the Pomeranian succession, the result was an open breach. Eric withdrew to Gotland, and the nobles established a federative union in 1438. In 1439 Eric was also deposed in Denmark in favour of his sister's son, Christopher of Bavaria.

For Christopher III's brief reign (1439-48), during which the privy council predominated, the three Scandinavian countries remained united. After his death the union was dissolved. The Swedes elected the former regent, Karl Knutsson, king as Charles VIII, Denmark and later Norway took a descendant of the royal house, Count Christian of Oldenburg, founder of the Oldenburg dynasty (1448-1863). The union policy remained an issue under Christian I (1448-81) and his successors John (Hans, 1481-1513) and Christian II (1513-23), mostly in internal Swedish party politics, but it was only for brief periods that the Oldenburgs reigned nominally over Sweden. Christian I was more successful in his policy toward Schleswig when the ducal line died out (1459) he managed—despite the provision in the *Constitutio Walde-mariana* of 1326 that Schleswig and Denmark must not be united under the same ruler—to become both duke of Schleswig and

the Holsteiners and the Jutland nobles. Fissured on all sides, the king left the country, the privy council then assumed control and, in 1370, concluded the peace of Stralsund, which granted the Hanseatic towns great commercial privileges but left the kingdom intact. Reluctantly Valdemar acquiesced in the treaty, which was

count of Holstein. He did so only by getting elected in 1460 by the combined Schleswig-Holstein knighthood on severe economic terms and on condition that the two lands remain 'for ever undivided'. Internal relations with the aristocracy were tense as the kings strove to free themselves from the privy council's increasingly severe charter demands while supporting vigorous Danish trades and crafts and resisting the economic pressure of the Hanseatic league. The farsighted but violent and two-minded Christian II strained this policy to breaking point. Setting the privy council and the nobles aside, he took commoners as his advisers and pushed radical laws in favour of burgher and peasant, Sweden he subdued by force of arms. But the decimation of the Swedish nobility in the Stockholm Bloodbath (1520) brought about the revolt and the liberation of Sweden under Gustavus Vasa and the increasingly violent policy directed against the Danish nobility and church led to final disaster. In 1523 a group of the country's most powerful men withdrew their allegiance. Despondently the king abandoned the struggle and left the country. The privy council called in his uncle, Duke Frederick. (See below.)

(A. E. CN.)

The 15th Century State—In the 15th century there had come into full development the differences which for two centuries were to characterize the Danish political situation. The constitutional problem was, to whom should belong the chief power in the country, the king or the landowners represented in the *rigsraad*, which at that time was made up of the country's 7 bishops and about 20 noble landowners, whom the king indeed chose but whom he had to take from the leading families and who thus corresponded in some degree to a privy council. This *rigsraad* possessed in theory the highest constitutional powers, for it elected the king, who ever since 1481, before being elected, had to sign a charter drawn up by the *rigsraad*, embodying the constitution of the country and asserting that the king should conduct no important state affairs without the sanction of the *rigsraad*. But except by open revolt the *rigsraad* possessed in reality no means of compelling the king, once elected, to observe the rules laid down in this charter, and further, this large assembly of men from all parts of the country who were themselves fully preoccupied with their own concerns, had naturally to leave to the king and his chancery the actual daily management of the political affairs of the country. Only in matters of local government was the king virtually compelled to make use of the nobles, who, insisting on their right to be appointed lords lieutenant, were in charge of the local administration in the 200 *herreder* (hundreds) of the provinces which were governed from the king's castles.

In the 15th century also the Danish people became divided more sharply into distinctive estates. Denmark's principal industry, then as at all times, was agriculture, and the cultivated soil, apart from about 700 manorial estates, consisted of about 80,000 farms, from 10 to 20 of which would be clustered together in country villages. Each of these villages was administered by the peasant farmers in common, whether these owned their farms themselves or were tenants paying a yearly rent—*landgilde*—to the actual owners. In the year 1500 there were about 12,000 Danish peasants who owned their farms, 18,000 were cultivators of land which belonged to the crown, the so-called *jaestebønder* or leasehold tenants, while about 30,000 were leasehold tenants of the church estates or of the estates belonging to the nobles, this large number resulting from the freedom enjoyed by these properties from the old land taxes due to the state. In one or two respects, however, this tax exemption had other results. Thus the leasehold tenant on a manorial estate was liable to certain terms of forced labour and feudal duties and when, as a result of the Black Death of 1348-49, many leasehold farms became vacant, a law was introduced by the lords of the manor in Zealand that the next heir to any leasehold tenant must take over his farm. This form of serfdom, therefore which enacted that a farmer's sons who had become artisans or tradesmen in a town could be forced to abandon their occupations in order to continue the cultivation of their father's farm, had the result that an estate owner in return for a payment would place his rights at the disposal of a neighbour, so that it is no exaggeration to speak

of the actual sale of farmers' sons.

The Danish church at this period with its 7 bishoprics and more than 70 monasteries, was immensely rich. It derived a huge income from its estates and leasehold farms, which were exempt from the old land taxes and on which extraordinary taxes could be levied only with its consent. It drew still greater revenues from the tithes on the entire corn production of the country, one third of such tithes going to the bishops, one third to the parish churches and one third to the parish priests. The pope, since the Council of Basle, had assumed the right to make all ecclesiastical appointments in Denmark, although he allowed the king certain nominations when he sought in 1458 to render the Vienna concordat of 1448 applicable also to Denmark. The Danish nobles, however, considered that the ecclesiastical appointments ought to come to their younger sons, who were too poor to buy estates, so they demanded and in 1523 obtained from King Frederick a decree that to become a bishop a man must be of the Danish nobility and to obtain an important prelate he must be either of the Danish nobility or else a doctor of theology. The result was that the service of religion was neglected, and the people turned away from a church most of whose leaders were concerned in spending the riches provided for them by their high offices. The setting up of a university and school of theology in Copenhagen in 1479 had the effect of bringing about a more serious study of the principles of Christianity. Paul Helgesen, who became *lektor* in 1519, vigorously attacked the malpractices in the church, especially in the matter of the sale of indulgences, but Martin Luther's break with Rome in 1521 changed Helgesen into one of the last great champions of the Catholic Church in Denmark.

The 15th century also was to mark a turning point in the history of the Danish nobility. Until then any Dane might become a noble by presenting himself in time of war well equipped for military service at his own expense. In return for this he was exempted from all taxes on his entire estate.

But from the 15th century the nobility marked itself off as an estate apart to belong to it a man had to show that his forefathers also for at least three generations had been exempted from taxation.

The nobles thus put a stop to the incursion of new families into their ranks. The king sought to effect an addition on a small scale by assuming to himself the right to issue titles of nobility but in contrast with England, where this practice secured for the nobility a continuous addition in each successive generation, the Danish nobility in the 15th century was made into something like a caste. After increasing from 242 families to 264 during the years 1400-50, the number sank from 230 families in 1500 to 140 (including at most 3,000 persons) in 1650. Of the noble families in the 15th century the Gyldenstjerne and the Rosenkrans (whose names are commemorated in William Shakespeare's *Hamlet*) were among the most important.

The Danish landowners of noble birth in the 15th century acquired estates in great numbers and were capable agriculturists. Their efficiency was demonstrated especially in Denmark's increased export of produce from the farms. The country had long had a market for its horses, now stall-fed bullocks were added and the landowners had to find sales not only for their own output of corn, butter, bacon, hides and meat but also for the supplies of these goods levied by them in the form of rent from their leasehold tenants. In this way the estate owners, lay and clerical, also became merchants, many of them had their own ships. An estate owner of a peasant farm who sold over to Ibsen and Rostock with corn, butter or pork needed to maintain his right to sell his own produce and to make purchases abroad to supply his own needs. But in this he found himself irritated by the policy claimed by Eric VII in 1422 and for a century maintained by the government namely, the ancient right that Danish merchants in the Danish mercantile towns had a monopoly in the transaction of business with other countries. Accordingly all Danish agricultural products had to be brought to these towns and there sold to citizens who in their turn exported them, and in the same way only citizens might import foreign goods which had to be bought in the same towns. In practice, however, the Danish

merchants were not wealthy enough to finance the trade in question, though the German merchants who had become Danish citizens were very eager to see the policy carried out and took up a position against the Danish estate owners and the Hanseatic merchants who were still doing good business in Denmark.

The Burghers and the Reformation.—In 1466 a cleavage had come about between King Christian I and the then leading Danish Swedish family of Thott. In 1468 Christian called together at Kallundborg the first Danish assembly of the estates of the realm consisting of representatives of the church, the nobility, the burghers and the peasants, so that they might vote him means for waging war against Sweden. From that time the government was on the side of the burghers against the landowners. It sought to create competition with the Hanseatic league by concluding treaties of commerce with England and the Netherlands. Christian II at this time was guided by the Dutch woman, Sigbrit Willemssoon, whose standing was more or less that of a controller of customs and finance, and by Hans Mikkelsen, burgomaster of Malmö. This ministry made the king, especially after the great victory in Sweden, an absolute monarch.

Under the leadership of Hans Mikkelsen were formulated two great laws, the law for the land and the law for the towns, which came into force at the end of 1521. Their tendency may best be gathered from the fact that they forbade "the evil and unchristian custom of selling the poor peasants'" and strongly maintained the monopoly of the Danish towns and burghers in regard to Danish trade. Thus the landowners of noble birth and their rights were entirely set aside.

The landowners, therefore, when Sweden was in insurrection in 1522, resolved to sweep aside this burgher government. The nobles from Jutland co-operated with Duke Frederick and the Hanseatic league, renounced allegiance to King Christian and on March 26, 1523, acclaimed the duke as Danish king. On April 13 King Christian left Denmark for the court of his brother-in-law the emperor Charles V. In 1531 he made an effort to win back his kingdom, but was taken prisoner in Norway and remained in captivity until his death in 1559.

It was not until 1524 that Frederick I (1523-33) assumed his position, when Copenhagen and Malmö, which had heroically supported King Christian, were forced to surrender by the great Holstein general Johan Rantzau. The victory was that of the Danish landowners and the *rigsraad*, King Christian's two great laws were abrogated, the landowners were now once more free to sell their peasants and to trade with any foreign merchants that they wished. It was the *rigsraad* that governed, Frederick I was king only in name. He came however to exercise a considerable influence in Denmark, for he and even to a greater extent his son Duke Christian gave their protection to the zealous reformers of the church, who were striving to bring about Denmark's accession to Lutheranism. Led by Hans Tausen, these reformers secured strong support among the burghers and the peasants, nor were all the landowners blind to the fact that they might benefit by demanding back the properties which their forefathers had bequeathed upon the church and the monasteries, although the majority sided with the Catholic Church. When the struggle was at its height, in 1533, King Frederick died and the *rigsraad* decided under the leadership of the Catholic bishops, who would not have Duke Christian king at any price, that Denmark should do without a king altogether and that the *rigsraad* would be government enough. The Danish burghers, however, would not agree to this. Their leaders, Ambrosius Bogbinder, burgomaster of Copenhagen, and Jørgen Kock, burgomaster of Malmö, concluded a treaty with Lubeck—where Jurgen Wullenweber had overthrown the old aristocratic ruling council—and joined together to restore the burgher king Christian II to the throne and to incorporate Copenhagen and Malmö in the Hanseatic league. The lay members of the *rigsraad* then, in 1534, recognized the necessity of choosing Duke Christian, and a bitter civil war followed, known to history as the "Count's War"—the count in question being Christopher of Oldenburg, great-nephew of King Christian I, whom Lubeck and her allies raised up to oppose Duke Christian. He acted throughout as the nominee of the captive Christian II.

Everywhere the burghers and the peasants took up arms and in North Jutland they won victories over the Danish nobles. But Johan Rantzau returned with his Holstein and German troops, and the peasants suffered severely in Jutland as well as on the islands. With Swedish and Prussian assistance a fleet was formed which, under Peder Skram as admiral, defeated the citizens of Lubeck. The Holstein army was conveyed over to Zealand and in July 1535 the siege of Copenhagen and Malmö began. Malmö surrendered in April, Copenhagen not until it had been besieged for a year in July 1536. On Aug. 6 Christian III (1534-59) made his entry into Copenhagen.

It was the king who had won the victory with the help of his Holstein troops, the effects of this decisive triumph of the monarchy became very perceptible in the future political development of the country. The most direct outcome of the conflict was the remodelling of the church. In accordance with a decision of the king's council of war on Aug. 22, first the bishops resident in Copenhagen were imprisoned, then the others all over the country, they were released only after they had submitted to the new organization of the church.

At an assembly of the estates in Copenhagen in Oct. 1536, at which representatives of the peasants were present for the first time, assent was given to the king's charter and to a statute which established the new church. The social life of the country was revolutionized. The church became a Lutheran state church with the king its supreme head, while seven bishops were to exercise supervision over the parish clergy. The property of the bishops and eventually also all the property of the monasteries fell to the king, and at the same time one-half of the farms of the peasant proprietors were confiscated, as a punishment for their having sided against the king. The possessions of the crown were thus trebled, so that it now owned rather more than half the soil of the country. The bishops' tithes henceforward went into the king's coffers, the revenues of which were increased through the better administration of the crown estates.

The lords lieutenant more often than not held their fiefs on a fixed rent or else only in return for feudal military service; henceforth they were obliged to account for the expenses and revenues of the fiefs so that the king should receive the balance. In 1533, of the country's 162 *herreder* (Schleswig not included) 43 were on the register, in 1559 there were 123. In the succeeding years efforts were made to combine the *herreder* into larger fiefs, the number of which in 1642 was 54. Centralization of government was carried out on a firmer basis, financial matters were dealt with under an exchequer, while the chancellors took over the administrations of the interior and the exterior. The defeated estates—the burghers and the peasants—lost in 1536 their political influence. The burghers for 100 years, the peasants for more than 300. The burghers had to abandon entirely their great trade policy and to share with the landowners the right to export bullocks (which gave the landowners almost a monopoly) and generally to put up with their commercial operations. For the peasants, what was of most importance was that the king and the landowners during the second half of the 16th century had started farming on a large scale. A great many leasehold tenants were thereby turned out of their fathers' farms, and since the larger new estates called for increased labour the leasehold tenants in the parishes of the large estates were called upon to give their services three days a week. In order to compel the unwilling, both the crown and the landowners began to make use of legal punishments, and many of the latter set up law courts on their own estates where they themselves or their bailiff sat in judgment on the peasants. Moreover the landowners retained in 1536 all their rights as nobles and even extended their economic and political power.

From 1560 agriculture became increasingly a remunerative occupation and, further, from 1590 the Dutch were steadily buying corn in Denmark and the Baltic provinces for shipment via Amsterdam to southern Europe. Apart from two quite fruitless wars against Sweden (1563-70, 1611-13), Denmark had enjoyed peace and made full use of it. Many of the landowners built themselves beautiful dwellings. The names of Tycho Brahe the

astronomer, Holger Rosenkrans the theologian and Arild Hvitfeldt the historian show that in the intellectual world also Denmark played its part. The burghers too were acquiring capital and were thus enabled to compete with the Hanseatic towns—for instance in the trade with Iceland. Frederick II (1559–88) built Kronborg as a support for the collection of the Sound dues, which continued to bring in larger and larger revenues. Christian IV (1588–1648) built, in the Dutch Renaissance style, the beautiful castles of Frederiksborg and Rosenborg, founded Glückstadt and Christianshavn and enlarged and adorned Copenhagen with new edifices such as the Bourse and new harbour works and fortifications.

The Swedish Wars—Christian IV was encouraged by success to make Denmark the leading country in northern Europe and to check the increase of Swedish influence. This aim was unattainable, for Sweden's power at this period was superior to Denmark's. Denmark could hold her own against Sweden only with her navy and it was this which repeatedly saved Denmark from destruction.

A period of misfortune began for Denmark when Christian IV, at the behest of England, intervened in the Thirty Years' War, first as Protestant leader against the emperor (1625–29), later, when he had had to cede his position to Gustavus Adolphus, as a mediator, until prevented by a Swedish attack in the years 1643–45. Both wars resulted in bitter defeats for Denmark. Denmark had to purchase peace at Bromsebro in 1645 by surrendering the islands of Gotland and Oesel and the Norwegian provinces Herjedalen and Jemtland. In order to find the money to defray the wars, Christian had to increase greatly the Sound dues, but this evoked much ill will on the part of the western powers, and although the Dutch in 1645 obtained considerable reductions they came to feel strongly that it would be a good thing if Denmark did not possess both banks of the Sound. Over and above all this, Lennart Torstensson's campaign (1643–44) brought the friendship of Frederick III of Holstein-Gottorp to the side of Sweden, and this developed into a definite alliance when Frederick III of Denmark (1648–70) rashly declared war on Sweden in 1657. This war, famous for the advance of the Swedish king Charles X over the ice from Jutland to the islands, ended in 1658 with the peace of Roskilde by which Denmark gave up Bornholm and Trondhjem and the southern provinces of the Scandinavian peninsula, while the duke of Holstein-Gottorp was acknowledged as a reigning prince in part of Schleswig.

These wars caused the Danish burghers' hatred of the nobles to break out more strongly than ever, and their differences were accentuated at the state assemblies which from 1638 onward were now and again called together. All the proposals made, even those on behalf of the king, for the betterment of the condition of the country, were rejected by the *rigsraad*, which was led by the high steward Korfits Ulfeldt, the husband of Christian IV's daughter Leonora Christina. As a condition of his accession the high steward compelled Frederick III to sign a charter which considerably diminished the royal prerogative in nominating at his own pleasure lords, lieutenants and members of the *rigsraad*. With great shrewdness and firmness, Frederick began to work for a change in the constitution. He succeeded in overthrowing Korfits Ulfeldt, who had been found guilty of treason, and when Charles X died at not having completely conquered Denmark, recommenced the war in 1658 and soon invested Copenhagen. The burghers of the city were stimulated into a heroic defence by the offer of great privileges. Copenhagen became a free *rigsstad* (crown city) whose assent was necessary for the settling of state affairs and whose burghers were to enjoy the same privileges as the nobles. The Dutch, who did not relish the idea of both shores of the Sound being in the hands of the Swedes any more than in the hands of the Danes, dispatched a fleet to the relief of Copenhagen, and on Feb. 12, 1659, the Swedish attack on the capital was repelled. Charles X's death was followed by the peace of Copenhagen in 1660. Bornholm and Trondhjem were given back to Denmark, but in other respects the treaty of Roskilde was confirmed because the western powers so willed it. Skåne, Halland, Blekinge and Bohuslän were forever lost to Denmark.

The Constitutional Revolution of 1660—After peace had been declared the estates met in Copenhagen in Sept. 1660. Measures of taxation were necessary but the nobles were as unwilling as ever to forego their exemption from taxes. The church representatives under the leadership of the Bishop Huns Svane, together with the burghers whose leader was Hans Nansen, the burgomaster of Copenhagen, then allied themselves to form an opposition party and forced the *rigsraad* and the nobles to take on a share of the taxes and to enter into negotiations with the king for a change in the constitution. They constrained the *rigsraad* and the nobles to confer on Frederick III and his family the hereditary succession to the throne, and when the *rigsraad* negated this proposal the opposition submitted it on Oct. 10 direct to the king. Under the pressure of threats the *rigsraad* gave in on Oct. 13, and the king was acclaimed with great pomp as hereditary sovereign on Oct. 18. In Jan. 1661 the government sent out an instrument or pragmatic sanction to be signed by all the more prominent citizens, landowners, bishops, professors, magistrates, etc., in which the king had conferred on himself not merely the succession but also absolute sovereignty.

The constitution which Frederick had promised was signed on Nov. 14, 1665. The king's law as it was called, made the Danish sovereign absolute inasmuch as it imposed on him the sole duties of keeping the kingdom undivided and of maintaining the Christian religion in accordance with the Confession of Augsburg while it further settled the succession on Frederick's heirs both in the male and female lines. An absolute monarchy was, indeed, the necessary and only possible constitution for Denmark in 1660 if it was desired to deprive the nobles of their political power. For the burghers were clever enough to perceive that however influential the nobles still were, a constitution would only have given them new power. The absolute monarchy meant that from now onward every distinction of rank between the noble and the unfree estates was done away with and that, as far as possible, all Danish citizens would be on a level under the absolute rule of the king.

The first task awaiting the monarchy was to bring about a new order in the kingdom. After the terrible misfortunes of the wars military affairs were completely separated from the civil administration. In the sphere of local government the country was divided anew into districts under superior magistrates who replaced the lords' lieutenants. In the sphere of central government there were established administrative boards (*kollegie-ordninger*), the two chambers to which the name *kancelli* was applied and the office of the exchequer were changed into administrative boards, other boards were instituted to deal with war and the admiralty, and yet another special board was set up apart as the supreme court of law of the kingdom.

The boards laid proposals before the king, who gave his decisions soon after the matter had been dealt with by a secret council the members of which, selected chiefly from among the heads of the boards, were nominated by the king. While the old Danish nobility held aloof on their country estates their places in the administration were taken by burghers.

The Burgher Bureaucracy—Thus there was formed a burgher bureaucracy in which the first and most significant figure was the brilliant Peder Schumacher, a member of a rich and highly respected Copenhagen burgher family, who in Nov. 1673 was made state chancellor (*rigskansler*) and created count of Griffenfeldt (*grev*). Griffenfeldt sought to remove the old deep-rooted differences between the estates. Though he himself was overthrown in March 1676, the burgher bureaucracy remained to play an important role during the first period of the absolute monarchy. Not until about 1730 did there come a change when the landowners—some belonging to the old nobility, others to the new one that had been created by a law of 1671—came again to power, but now only as servants of the absolute monarchy.

A joint code of laws for the entire kingdom was issued under the name of Christian V (1670–99) in 1683; serfdom was abolished in 1702 and for a brief period the Zealand peasant became free, trade and industry were protected in accordance with mercantile principles, schools were opened in the provinces and thus a

foundation was laid for a system of elementary education. But almost the most important reform of the whole period was the setting up in 1684 of a registration system throughout the kingdom whereby the land was classified according to its value, with the intention of attaining a more equitable distribution of taxes.

The absolute monarchy regarded it as an inherited responsibility to fight the traditional enemy Sweden and to reconquer Skåne. Hence the Skåne war of 1675-79 and the great Scandinavian wars of 1700 and 1709-20, which entailed terrible sacrifices. Skåne was not regained, but it was as a result of victories over Charles XII of Sweden and his ally, the duke of Holstein-Gottorp, that Frederick IV of Denmark (1699-1730) in 1721 was able to take possession of the ducal part of Schleswig and include it in the monarchy. The outcome naturally was a bitter hatred against Denmark on the part of the ducal family of Gottorp, the more dangerous since the dukes became in 1743 heirs to the crown both in Sweden and in Russia.

When the duke himself in 1761 became emperor of Russia as Peter III a war seemed inevitable, and Denmark had to arm on a great scale. But the tsar was murdered at the instigation of his wife, who succeeded him as Catherine II, and Denmark's foreign policy, which since 1775 had been controlled by J. H. E. Bernstorff, took on a new turn, namely, to induce the empress to exchange the Gottorp portion of Holstein for Oldenburg (which Griffenfeldt had won in 1673 for Denmark).

This aim was achieved in 1773 and the Danish king once again held possession of both dukedoms, Schleswig as a Danish, and Holstein as a German fief.

The 18th Century State—The weight of taxation was burdening the people, especially as the period preceding the year 1767 had been one of terrible depression for Danish agriculture. The price of corn had gone steadily down, for the Dutch could now buy wheat in England, which at this period supported her wheat exports with a premium. The exportation of bullocks had ceased, the Dutch about 1720 having instituted a heavy tax on Danish bullocks. The Danish peasant population was impoverished and Danish land sank lower and lower in value. To cover the expenditure which the war with Sweden had entailed, the crown was obliged after 1660 to effect considerable sales of its property. Gifts from the king to ministers and favourites and continual sales resulted in a steady increase in the landowner's share of the soil. In order to collect taxes from the peasants the crown had to make the landowner responsible for the taxes which their leasehold tenants had to pay. In return for this the owners were granted exemption for their principal estates, thus exemption for the landowners was restored, though upon a new basis of law. The new nobility of counts and barons not only acquired all the rights formerly enjoyed by the old Danish nobility, together with the exemption from taxation on a part of their peasant farms, but also the right to leave all their estates together in entail to the eldest son, although as a fief which on the extinction of the direct line should revert to the crown. The harder the times the more the crown had to accede to the demands of the landowners, which were, as before, that they should be able to compel occupation of their leasehold estates and obtain free labour from their tenants. One of the first acts of Christian VI (1730-46) had been the abolition of the national militia, but in 1733 it was reintroduced, in combination with the so called *stamnsbaand*, which provided that all Danish farmers' sons from their 14th to their 36th year should be bound as villeins to the estates on which they were born. In 1745 it was further decreed that even a soldier who had served his time was bound to return to the same estate and to take up a tenant farm. As soon as the landowners had obtained these rights over their leasehold tenants, they could set their requirements in the matter of forced labour as high as they liked; they could have the refractory conscripted for the hated military service and could employ any bodily punishment.

In the middle of the 18th century, however, an economic advance became observable when, under the leadership of France colonial goods from the West Indies (especially sugar, coffee and tobacco) began to find a European market. Denmark

acquired three West Indian islands of which the most important was St. Thomas. The eastern Asiatic trade also began to flourish under the leadership of England. Danish trade expanded and the new Asiatic and West Indian companies both prospered. In 1736 a Danish bank of issue was founded which supported these ventures and when the great colonial war broke out between France and England the neutral trade of Denmark greatly benefited thereby. A. G. Moltke, the favourite of Frederick V (1746-66) and a great landowner, was the first person to realize that this might also benefit Danish agriculture by opening up greater possibilities of production. But the landowners were thoroughly conservative and would not consider the economic freedom of the peasants. Their rule was overthrown in 1770 by Johan Frederik Struensee, an accomplished physician and a man of great gifts who secured power through his liaison with Caroline Matilda, sister of King George III of England, who had been united in an unhappy marriage with the degenerate and morbid Christian VII (1766-1808). Struensee carried through a number of reforms, but conservatism again revived under Ove Høgh. Guldberg, who declared that the "yoke of the peasants could not be removed without Denmark's shaking and quivering to its foundation."

Agricultural reforms were imminent, however, and when the crown prince Frederick in 1784 had acquired power by a coup d'état, he found a brilliant spokesman in a Danish landowner of old Danish stock, Christian Ditlev Reventlow, who had studied agriculture in England. Reventlow became the life and soul of a commission which brought about the liberation of the Danish peasant. The *stamnsbaand* was ended on June 20, 1788, villeinage was stopped, compensation in money being given, the ancient agricultural associations were done away with, and the peasant was allotted his own plot of land. Many at once quit the villages for the country. Transition to freehold ownership was the ultimate aim of this great land reform, which was carried through thoroughly and with excellent results.

The Napoleonic Wars—The circumstances of the moment were helpful. By 1767 England, as the result of its industrial awakening, had changed from a corn exporting to a corn-importing country. As a result Amsterdam once again had to purchase corn in the Scandinavian countries and the prices of corn and agricultural products rose steadily during the period of the French Revolution and the Napoleonic wars. It was in this favourable period, which continued until 1807, that more than half the Danish peasants obtained ownership of their farms.

The period was favourable also for Danish trade, for the foreign minister, Andreas Peter Bernstorff, succeeded like his uncle, J. H. E. Bernstorff, before him in keeping Denmark out of the wars. After his death in 1797 there came a clash with England, for Denmark together with Russia and other neutral powers was attempting to safeguard trading vessels by convoys of men-of-war. Lord Nelson was sent with a fleet to break up the alliance of the northern powers. There followed the sea fight off Copenhagen on April 2, 1801. After a gallant resistance the Danish fleet was destroyed and Denmark had thenceforward to cease sending convoys. The period which followed brought great benefits to Danish agriculture and trade. Commerce had been facilitated by the toll law of 1797 which extended the principle of free trade. Wealthy businesses grew up in Copenhagen, and the bank of issue granted ever-increasing credit. After 1757 the bank was exempted from having to meet its notes with silver, and after it was taken over by the state in 1773 it had not only to emit as many notes as were required for the carrying on of business but also to meet in this respect the state's need of money.

In 1807 England called upon neutral Denmark to give up her considerable navy lest it should be used by Napoleon against England. George Canning's demands had to be complied with, but not before an English army had laid large portions of Copenhagen in ruins. In anger over this, Frederick VI (1808-39) from that time onward attached himself politically to Napoleon. Seven burdensome war years followed, in the course of which relations between Denmark and Norway were completely broken off and Danish trade was gradually brought to a standstill. When

at last victory fell to the coalition Denmark had to conclude a peace at Kiel in 1814 by which Norway was handed over to Sweden and Heligoland to England, in exchange Denmark acquired Lauenburg.

The war had cost immense sums of money which, since neither taxes nor loans were available, the bank of issue had to meet by a limitless issue of notes. In 1813 the bank went bankrupt and a new national bank was founded, which in 1818 became a private concern entirely independent of the state. Its notes first reached par in 1838 and became payable on demand in 1845. The failure of the bank, the destruction of Danish trade and the fall of corn prices during the first ten years after the war left a period of poverty and stagnation during which, moreover, the land reforms came to a standstill.

The June Constitution.—This condition of things naturally called forth criticism of Frederick's absolute government. Then under the influence of the July Revolution in France, Frederick in 1834 set up four consultative provincial assemblies. These marked the beginning of parliamentary life and encouraged public discussions of political questions. A Liberal party came into existence and set itself the task of substituting for the absolute government a new constitutional government representative of the people. Even Christian VIII (1839-48), who as king of Norway in 1814 had co-operated in framing Norway's free constitution, did not seem disposed to perform the same service for Denmark. Immediately after his death on Jan. 20, 1848, came the revolution of February in France and the short-lived victory of liberalism. In Copenhagen the movement had its outcome in a public procession on March 21 to the new king, Frederick VII (1848-53), who was able to reply that he intended to renounce the absolute rule and that he had already taken steps toward forming a government responsible to the representatives of the people.

This was appointed next day with A. W. Moltke as premier, among the ministers were leading National Liberals like D. G. Monrad, A. F. Tscherning and Orla Lehmann. On Oct. 23 a national assembly met which, on the basis of a draft submitted by Monrad, prepared the constitution of the Danish kingdom of June 5, 1849. The legislature became a *rigsdag*, with specified powers, consisting of a *landsting* and a *folketing*, the members of the former were to be elected for eight years by indirect vote and the latter for three years by direct vote.

The Schleswig-Holstein Question.—In the meantime the question of the new constitution was thrown into the shade by the widening differences between Germans and Danes. The Napoleonic wars had awakened the German national feeling, and the political bonds which had existed between Schleswig and Holstein ever since 1460 suggested that these two regions should form a single country within a united Germany. These efforts evoked a counter-movement among the Danish population in North Schleswig and from 1838 in Denmark itself, where the Liberals especially had taken up the fight and, from 1842, were insisting that Schleswig had belonged to Denmark for centuries and that the frontier between Germany and Denmark must in the future as in the past be the Eider. (See SCHLESWIG-HOLSTEIN QUESTION.) This difference between Eiderism, as it came to be called, and Schleswig-Holsteinism led in March 1848 to an open Schleswig-Holstein revolution, helped by the armed intervention of Prussia. The outcome of this was a three years' war (1848-50) which ended in a victory for Denmark. Great Britain, France, Russia, Norway-Sweden in 1850 recognized the integrity of the Danish monarchy and, in the London convention of 1852, together with Austria and Prussia acknowledged Prince Christian of Glücksburg as heir to the whole monarchy after the death of the childless Frederick VII. In the agreement with Prussia however the Danish government was obliged (1851-52) to undertake that in the ultimate framing of the constitution of the monarchy Schleswig should not be brought into closer relationship to Denmark than to Holstein. The impossibility of fulfilling this condition was soon to be seen.

In the Danish *rigsdag* three parties had been formed: the Conservatives comprising the landowners and all those who were

against the free constitution, the National Liberal Burgher party, which had carried through the June constitution, and the left, including the Peasants and "Friends of the Peasants" (*Bondevennerne*), whose chief desire was for a continuation of the land reforms. The Conservatives were in favour of restricting the June constitution as much as possible being ready to fulfill their promise to Prussia by creating a conservative joint constitution for the whole kingdom, with a joint *rigsraad* in which the Holstein landowners should also be represented. Such a constitution came into existence in 1855 but the Holsteiners promptly refused to meet in a joint *rigsraad*. After 1857 the National Liberals returned to power with Carl Christian Hili (*g v*) as prime minister. He abolished the joint constitution for Holstein and on Nov. 18, 1863, prevailed upon the new king, Christian IX (1863-1906), to sign a new joint constitution for Denmark and Schleswig which brought Schleswig into closer relationship to the kingdom than to Holstein. Otto von Bismarck was anxious for a popular war and desired the harbour of Kiel for Prussia, Austria agreed to join in and the two predominant German powers crushed down Denmark's heroic defence at Dybbøl (Dybbøl) in 1864. By the treaty of Vienna the three duchies of Schleswig, Holstein and Lauenburg, including the Danish North Schleswig, were surrendered. In 1866 after the Austro-Prussian War they became part of Prussia. Napoleon III in the treaty of Prague procured the insertion of an article (art. v) to the effect that North Schleswig should be reunited with Denmark when the majority of the population by a free vote should so desire, but it was in vain, for in 1878 Prussia and Austria agreed to the cancellation of the article.

The July Constitution.—The National Liberal Eider-Danish policy had brought about Denmark's defeat. The Conservatives took office and carried through in co-operation with the Peasants, who disliked the National Liberals, the new constitution of July 28, 1866, which was considerably more conservative than that of June. The general suffrage was indeed retained in the case of the *folketing*, but in the composition of the *landsting* the landowners and the most highly taxed people were given an altogether overwhelming influence. This resulted in the two chambers entering into a state of permanent opposition to each other. In 1872 the left severed their alliance with the Conservatives, who soon combined with the National Liberals to form a right. This right leaned on the *landsting* and maintained the king's privilege of selecting his ministers without regard to the majority in the *folketing*.

In 1872 the left secured a majority in the *folketing* and insisted on the parliamentary system—the king's duty to choose his ministers from the party with such a majority. The struggle persisted from 1875, when J. B. Estrup, the leader of the right, became prime minister, until 1894 when he went out of office, other and weaker ministries of the right held power until 1901. The contest was bitter, for throughout all this period the left had a growing majority in the *folketing*. The election of 1884 gave them 81 seats out of 102, of which 2 were held by the first Social Democrats ever elected to the chamber. The right demanded large appropriations for defense, in particular for the fortifications around Copenhagen, the left, under the leadership of A. O. Høp, who after the 1870s stood for a foreign policy of neutrality and disarmament, refused to admit this. Under the leadership of Kristen Berg the *folketing* went so far as to negative the budget in 1876, in 1885 and again in 1894. But Estrup, like Bismarck, did not shrink from letting the king declare a "provisional budget," and by this means the right were able to provide for the fortifications of Copenhagen and to maintain themselves in power. Only when the election of 1901 had reduced the government's strength in the second chamber to 8 members of the right and 16 of the so-called Moderates, as against 76 of the left and 14 Social Democrats, did King Christian IX request J. H. Deuntjers to form the first left ministry, of which Jens C. Christensen, Høp and Christopher Hage became members.

Economic Progress.—The continual rise of prices down to 1873 had made possible a resumption of the land reforms which the Friends of the Peasants and the left desired and which were supported also by the National Liberal government in the case of

Monrød's law of 1861 changing the leasehold tenancies into freehold land. Thus 76% of the farms were freehold by 1875, and 94% by 1905. The increasing exports of corn from America and Russia between 1875 and 1895 again brought Danish agriculture to a precarious state, but it saved itself by producing butter and bacon instead of corn and by making these goods standard commodities in the English market through its co-operative dairies and slaughterhouses. Later there came co-operative export associations.

Estrup's policy had made Esbjerg an important centre for the English export trade. C. F. Tietgen founded the United Steamship Co. (whose Esbjerg Harwich line took over the export to England) and the great Northern Telegraph Co., which acquired its greatest importance through its relations with China and Japan. New banks were founded, including the Landmands bank (Agriculturists' bank) in 1871 and the Handelsbank (Trade bank) in 1873. The towns grew, in the course of the '70s Frederick III's old ramparts round Copenhagen were pulled down and new quarters arose on their site. A wage earning class came into existence who were soon identified with the Social Democrats, which party in 1884 sent two representatives to the lower chamber. A labour conflict in 1899 led to the establishment of a court of arbitration for the settlement of labour disputes. The constitution of June had already acknowledged the full and unfettered right of association. In 1891 there was introduced an old-age pension law, in 1892 a health insurance law, in 1899 an important law for the establishment of small farms with state help.

Ministries of the Left—As a ministerial party the left had great difficulties to overcome. It had to try to introduce universal suffrage in the election of parish councils (*sogneraad*), of county councils (*amtsraad*) and even of the lower chamber itself, for which a new fundamental law was required, it had to proceed with social legislation, it had to change taxes such as the tithe into taxes upon the incomes and property of the citizens, it had to introduce regular budgets. The Deutscher ministry succeeded in carrying through the reform of the taxes in 1903, two years later Jens C. Christensen became prime minister. He was anxious to demonstrate that the left could rule, even with a hostile upper chamber, but he held that to this end it was necessary that the left should break with the Social Democrats and declare themselves willing to carry through measures of defense adequate to the country's needs, even if it should prove impossible to effect a reduction in military expenses. The result was that a small section of the left which would not admit the necessity of these two measures set up as an independent party, the Radical party, under the leadership of Carl Theodor Zahle. In the following year the military problem became the dominant issue, the prime minister endeavoured to solve it in conjunction with the Moderates, whose leaders were Klaus Berntsen and Niels Neergaard. But in 1908 the ministry was severely shaken when the minister of justice, A. Alberti, was forced to resign and subsequently confessed himself guilty of frauds.

The Christensen cabinet was compelled to resign in the following October. Three short lived cabinets followed, namely those of Neergaard, Count Holsten Ledreborg and Zahle, whereupon Klaus Berntsen (July 5, 1910) formed a cabinet of the left, including the Moderates, which lasted until 1913.

In 1910 the left had opened an agitation for a democratic amendment of the constitution. The right, which was strong in the *landsting*, opposed, and no solution had been reached when the elections were held in May 1913. The Radicals and Socialists now held 63 seats out of the 114 in the *folketing* and united to force the reform under a new Zahle cabinet containing Erik Scavenius (foreign affairs), Edvard Brandes, Ove Rode and Peter Munch. The right answered by obstruction in the *landsting*, which the government then dissolved. The new *landsting* contained 38 supporters and 28 opponents of the constitutional amendment.

(E. A. P., X)

World War I.—During the crisis of July 1914 the Danish government pursued a cautious policy. When war broke out on Aug. 1 it immediately proclaimed its neutrality and mobilized an emergency force of 54,000 men.

On the night of Aug. 4-5 Germany began mining Danish southern waters and next morning the German minister asked if Denmark would lay mines in the Great Belt. Learning that the Germans would otherwise lay the mines themselves and build fortifications on the coast to protect them, the Danes gave an affirmative answer. King Christian X. (1906-47) having informed his cousin the king of England, who sanctioned it. All Danish waters were mined.

During this crisis the Zahle government proposed a coalition of all four parties, but discussions between them came to nothing. The *rigsdag* passed several emergency laws, primarily of economic character. A serious problem was the trade with England and Germany. Germany was able to stop the Danish export to England and England could stop import of necessary supplies for Danish agriculture and industries. Arrangements acceptable to all interests were concluded, and in November the Scandinavian countries declared that they intended to follow a uniform trade policy. In December a meeting of the three Scandinavian kings, premiers and foreign ministers took place at Malmö.

From 1915 the difficulties began. The restrictions on imports, imposed by England, became more severe. The German U-boat warfare was expanded from Jan. 31, and in the following years more and more Danish ships were sunk. The total loss during the war was 667 lives and 28,000 tons. When the United States entered the war in 1917 difficulties increased, because of U.S. restrictions on trade with Germany. Gradually the consequences of war were felt on the domestic scene. Agreements with the belligerents made restrictions on business necessary but were received with resentment. To combat inflation prices on domestic products were fixed, but legislation forcing the farmers to deliver certain amounts of grain met with opposition. From April 1, 1917, rationing was gradually introduced on several goods. Salaries did not rise with prices, and shortages in raw materials created unemployment. Rising governmental expenditure made higher taxes and loans necessary.

Politically, the question of a new constitution was taken up again when the first anxiety over the war had been allayed. The right was now interested in an agreement, and in 1915 the new constitution was passed. This provided a two chamber parliament with equal suffrage for men and women. The privileged suffrage for the landlords and the wealthier classes electing the upper chamber came to an end. The voting age for the upper chamber (the *landsting*) was 35 years and for the lower chamber (the *folketing*) the age was to be lowered successively from 30 to 25 years. The *landsting* had 72 members, 18 of whom were elected by the outgoing chamber, the remainder by indirect elections. The *folketing* had 149 members, of these 93 were elected in individual districts and 24 in Copenhagen according to proportional representation. The additional 23 seats were distributed according to each party's percentage of the total vote. In the case of an amendment of the constitution a referendum had to take place. After the amendment had passed the two chambers of parliament, according to specific rules, 45% of the eligible voters had to vote in the referendum to give it validity.

A result of the new constitution was that the right accepted political democracy and parliamentary government. In Dec. 1915 the Conservative People's party was formed.

After the new constitution had been signed by the king on June 5, 1915, the Zahle government again tried unsuccessfully to form a coalition government. Nevertheless, important legislation was passed during the following years without much opposition. This included the reform of the administration of justice (April 11, 1916), which separated the administrative and judicial systems and introduced oral proceedings and publicity and trial by jury in criminal and political cases.

The privileged suffrage for county councils (*amtsraad*) was finally abolished in 1916. The land reform of 1919 is explained elsewhere in this article. A law passed on July 6, 1916, made it a duty of all employers to insure their employees against accidents. A law regulating limited companies was passed in 1917 and the first regulatory bank law was passed in 1919.

When the government in Aug. 1916 concluded a treaty ceding

the Danish West Indies (the Virgin Islands) to the United States for \$25,000,000 a political conflict arose. The Conservative and Liberal parties were originally opposed to the sale of the islands but a coalition government was formed on Sept. 30, and a plebiscite was held. At the polls (Dec. 14 1916) 283,670 votes were cast in favour and 158,157 against, and the treaty was ratified.

The first election for the *rigsdag* in accordance with the new constitution was held in April 1918. Already in January the coalition had been dissolved, but the Zahle government was upheld by the Radical Liberal and Social Democratic parties. The election issues were the government's economic policies, as many groups were tired of the restrictions and rationings imposed during the war. The election resulted in losses for the two government parties. The new *folketing* consisted of 22 Conservatives, 46 Liberals, 32 Radical Liberals, 39 Social Democrats and 1 independent, the government majority thus being only 2. In the *landsting* the Conservatives won 18 seats, the Liberals 26, the Radical Liberals 13 and the Social Democrats 15, the opposition parties thus having a majority.

Peace and the Schleswig Question, 1918-24—After the armistice on Nov. 11, 1918, the emergency army was quickly dissolved, the wartime military regulations abolished and the land defenses of Copenhagen destroyed. The defeat of Germany made possible the return of a part at least of Schleswig, but opinions were divided as to how big a part of the province Denmark should try to regain. The Danish population's representative in the German parliament, the Schleswiger H. P. Hansen, and the Zahle government wanted only those parts where the population was indisputably Danish and suggested a plebiscite in the northern zone of Schleswig, but an increasing number of the Danish people wanted the city of Flensburg too, or the whole province of Schleswig.

Hansen had already raised the question of self-determination for the Danes in Schleswig in the German *reichstag* in Oct. 1918. The Danish government on Nov. 28 turned to the victorious Allied powers and suggested a plebiscite in two zones: the first zone should vote as an entity, while in the second, which should include Flensburg, voting should be counted community by community. The Versailles treaty contained these provisions. Voting took place on Feb. 10, 1920, in zone 1, where 75,000 votes were cast for Denmark and 25,000 for Germany, and on March 14 in zone 2, where there were 52,000 for Germany and 13,000 for Denmark, only three small communities voting for the latter. The frontier was thus drawn as close to the nationality line as possible. In June the necessary amendment of the constitution was passed, and on July 10, 1920, North Schleswig was incorporated into Denmark.

At that time disagreement over the Schleswig question and other political controversies had resulted in the "Easter crisis" of 1920. Although the Zahle government had a slight majority in the *folketing* the king felt that the majority of the people was against the government's Schleswig policy and dismissed the ministry on March 29. The Social Democrats considered this move unconstitutional and threatened a general strike, but in a few days a ministry of nonpoliticians was formed with the task of framing an electoral law and holding elections. The election took place on April 26, 1920, with the Conservatives winning 28 seats, the Liberals 49, the Radical Liberals 17 (losing 50% of their seats) and the Social Democrats 42. The Liberal N.

prices in 1921 resulted in a severe crisis. Calculating that markets would be opened up in eastern Europe, many firms had overstocked and when their expectations proved wrong they found themselves in difficulties. Home industries that had grown up during the war were now hit by foreign competition, and in 1921-22 unemployment rose to 19.3%. The industries called for protection, but the government stuck to the free trade policy. Many bankruptcies ensued and several banks closed. In March 1922 the Copenhagen Landmandsbank was saved only by government intervention. Losses amounted to 500,000,000 Kr. Several of the leading bankers were convicted of fraud.

From 1923 the business cycle turned, exports rose and unemployment fell, but the value of the krone continued to decrease. In the elections for the *folketing* held in April 1924 the Neergaard government was defeated. The Liberals got 45 seats, the Conservatives 28, the Social Democrats 55, the Radical Liberals 20 and the German minority 1. Important legislation during the Neergaard period comprised a new defense law in 1922, reducing expenses on defense to 44,000,000 Kr., a sickness and invalid insurance law, an extension of land possibilities for small holders, and several laws concerning the church, such as one that admitted laymen to the pulpit and one that permitted free choice of civil or ecclesiastical marriage.

Social Democratic Government, 1924-26—After the election in 1924 the Neergaard government resigned, and Thorvald Stauning formed the first Social Democratic government in Denmark. Together with the Radical Liberals the Social Democrats had a majority of 2 in the *folketing*, while the opposition had a majority of 43 against 33 in the *landsting*. This forced the government to restrict legislation to the fields where an agreement with the opposition was possible.

On the advice of an expert committee the government in December introduced a law bringing the value of the krone gradually up to par, and in 1926 the gold standard was reintroduced. This deflationary policy led to a new crisis, marked by a heavy fall in agricultural prices, industrial difficulties and unemployment. The employers declared the biggest lockout in the history of Denmark, which ended in a deadlock when they were forced to give up the planned wage reductions. Bad economic conditions continued through 1926, unemployment figures reaching 29.8%. A bad harvest and German tariff on agricultural products increased the difficulties. In October the government introduced extensive legislation to combat the crisis, but the Radical Liberals voted against it. The ensuing election resulted in defeat for the government, the Social Democrats losing 3 seats and the Radical Liberals 4, while the Liberals and the Conservatives gained 2 seats each. A new party adhering to the ideas of the American Henry George won 2 seats and the German minority party 1 seat.

The Social Democrats, representing industrial and agricultural labour and small landholders, introduced legislation reducing the army and the navy to a frontier guard and proposed factory councils, an eight-hour working day and certain laws regarding banking and limited companies. These were all rejected, but in co-operation with the Liberals the government had passed a tax reform, which partly based land taxes on land values exclusive of improvements.

The Madsen Mygdal Government, 1926-29—The king failed in his attempt to get a coalition government, and the Liberal leader T. Madsen Mygdal, an estate owner, became prime minister. In February Madsen Mygdal introduced a budget cutting governmental expenditure by 60,000,000 Kr. through reduction in civil servant salaries, social legislation and military appropriations, but this did not solve the problems arising from unemployment and agricultural distress. In 1928-29 economic prospects seemed brighter, but a bank crisis in Sept. 1928 indicated further worries ahead. The government's continued deflationary policy, together with a law restricting the activities of trade unions, raised bitter opposition among labour groups.

A conflict with the Conservative party on military appropriations forced the Madsen Mygdal government to dissolve the *folketing*. In the following election the Social Democrats gained 8 seats, the Liberals lost 3, the Conservatives lost 6, the Radical

Liberals retained their previous number and the Henry George party (*Retsfrie partiet*) won 1.

The Stauning Munch Government, 1929-40—The new government was a coalition of the Social Democrats and the Radical Liberals with Stauning as prime minister and the Radical Liberal leader P. Munch as minister of foreign affairs, its program included disarmament reform of the social legislation and the abolition of the *landsting*.

Shortly after the formation of this ministry the world economic crisis broke out and Denmark being highly dependent on foreign trade (especially with England and Germany), soon felt its consequences. At the end of 1930 there was a heavy decline in agricultural prices. The crisis spread to industry and to the building trades and unemployment increased. In 1932 one third of registered labour was unemployed and in the winter of 1932-33 economic collapse seemed imminent. Under these circumstances any idea of a return to prewar economy was untenable, and many forms of state planning were introduced. But strained economy and social unrest gave extreme parties a chance. During the early 1930s dissatisfied farmers formed a party and the Communists won seats in the *rigsdag*. A small group had adhered to fascism in the 1920s, and a Nazi party was also formed in the 1930s. Neither fascists nor Nazis gained any substantial following, and their activities were curtailed by the law of April 1933, which forbade the civilian use of uniforms in public (except for Boy Scouts).

When England left the gold standard in Sept. 1931 Denmark followed suit. In Jan. 1932 all trade in foreign currencies was centralized in a governmental authority, restrictions on imports were introduced and the government succeeded in keeping the krone stable in relation to the pound.

After the Ottawa agreements an Anglo Danish trade agreement was concluded in April 1933, increasing imports from England. Bilateral trade agreements were made with Germany and other countries in the following years.

The economic crisis made extensive domestic legislation necessary and brought about co-operation between the coalition parties and the opposition. In Oct. 1931 the first "crisis agreement" was concluded with the Conservative party, providing relief for the unemployed and help to farmers, financed by increased taxation. In 1932 a new agreement was concluded, with all four parties co-operating.

In Nov. 1932 the *folketing* was dissolved. The following elections resulted in a victory for the government parties, but for the first time the Communists were represented in parliament. In Jan. 1933 a compromise was concluded (*Kanslergadeforliget*) by which the agreements on wages were prolonged, the value of the krone reduced and fixed prices guaranteed to farmers for specified amounts of each agricultural product. By this legislation planning was further advanced. Earlier social legislation was coordinated and expanded into the *Socialreform*, which made Denmark one of the most progressive "welfare states" of western Europe. A new criminal code was passed and several public works projects were initiated, e.g., the building of bridges connecting the islands.

In the autumn of 1935 the government again dissolved the *folketing*, and the Social Democratic party won a great victory. At the elections for the *landsting* next year the government coalition won a majority in this chamber too. New legislation on public works and working hours in factories was passed.

Having now won control of both chambers, the government introduced a new constitution, abolishing the *landsting*. The Liberals opposed any change in the constitution, but the Conservatives, now that they had lost their hold on the upper chamber, were interested in constitutional reform. Discussions between the Conservative party under Christmas Møller, and the government coalition resulted in a constitutional bill on the principle "one electorate and one election day." The age limit for voting was lowered to 23 years. Parliament was to be elected as one body but to be divided after the election into two chambers, the *folketing* and the *rigsting*. The amendment further contained provisions for plebiscites. The bill was introduced in parliament

in Oct. 1938 and passed. According to the provisions for constitutional amendments parliament was then dissolved and a new election held. The new parliament also passed the bill. A plebiscite followed and the bill was rejected, since the required 45% of the electorate did not vote. After this defeat the government declared that the constitutional question would rest. A few months later World War II began.

Foreign Relations, 1918-40—From the beginning of the 20th century public opinion in Iceland had turned more and more toward independence, and in 1918 the constitutional relationship between Iceland and Denmark was amended. According to the new Danish Icelandic treaty of union the two countries were independent sovereign states, united through the king. The treaty contained provisions for common citizenship and stipulated that the Danish foreign service should represent Iceland in foreign countries, that Danish naval ships should take care of the inspection of fisheries in Icelandic waters, that a Danish Icelandic council, meeting alternately in the two countries, should give advice on questions of common interest, and finally that amendments or a declaration of complete Icelandic independence could take place in 1940.

Already before the end of World War I a Danish committee had worked on a charter for an international organization. In March 1919 a delegation participated in forming the covenant of the League of Nations, and in Jan. 1920 Denmark accepted the invitation to join the new organization. The parliamentary resolution authorizing this stated that the charter did not bind the small nations to participate in military sanctions or restrict their freedom to reduce armaments. Denmark took part wholeheartedly in the activities of the League in the following years and had from 1933 to 1936 a nonpermanent seat in the council. It concluded arbitration treaties with several countries in the 1920s and signed the Kellogg-Brand pact in 1928.

In 1931 a conflict with Norway arose over Greenland. When the Norwegian Danish union was dissolved in 1814 this island had remained with Denmark. The Danish trading system had been extended to the western coast during the 19th century, and the United States had acknowledged Danish sovereignty over the whole island in connection with the sale of the Danish West Indies. In 1919, when Norway raised the question of sovereignty over Spitsbergen, the Danish government had secured from the Norwegian foreign minister an oral acknowledgment of Danish sovereignty over Greenland and acknowledged in return the Norwegian claims to Spitsbergen. The Norwegian government nevertheless raised the question again in 1921 and during the following negotiations, maintained that East Greenland, apart from one Danish settlement, was no man's land. In 1931 the country between the 71st and the 75th parallel and in 1932 the district between the 60th and the 63rd were occupied by Norwegian expeditions and proclaimed to be Norwegian sovereignty. Denmark appealed to the Permanent Court of International Justice which decided on April 5, 1933, in favour of Danish sovereignty over the whole of Greenland. Excitement over this conflict soon subsided in both Norway and Denmark, and Scandinavian co-operation in foreign affairs increased in the later 1930s, meetings of the Scandinavian foreign ministers had been taking place since World War I. A common attitude was discernible in the League of Nations, and as the European and international atmosphere grew serious in the 1930s understanding between the Scandinavian states, now joined by Iceland and Finland, became closer. Denmark joined Finland, Norway, Sweden, Belgium and the Netherlands in the "Oslo group" created in 1930 for co-operation in tariff questions, and these states tried also to form a political partnership. But as the influence of the League of Nations declined the Oslo group at a meeting in Copenhagen in July 1938 declared that members of the League were no longer bound to participate in applying sanctions.

As the power of Adolf Hitler's Germany grew, Danish apprehensions increased, and it was feared that Germany would raise the question of North Schleswig. Early in the 1930s the German minority in this province had become restless, and its representative in the *folketing* raised the question of reunion with Germany.

The government in many ways tried to satisfy the German-speaking citizens, and when Germany in May 1939 proposed a non-aggression treaty Scandinavian co-operation broke down. Denmark accepted the German offer which was rejected by Sweden and Norway. The treaty was signed May 31 in Berlin. The two countries pledged themselves not to go to war against each other or give help to belligerents against the other. The treaty, valid for 10 years, provided that normal trade should be allowed during a conflict between one of the powers and a third country.

During the 1930s the question of Danish defenses had been discussed several times. In 1932 and 1937 new defense laws had been passed, but when war broke out in Sept. 1939, Denmark was badly prepared to withstand an attack.

World War II—When World War II broke out, the government immediately proclaimed Danish neutrality and, as in 1914 parliament passed laws adapting the economy to the new situation. The Stauning Munch government suggested a coalition backed by the so called "old parties," but the offer was rejected by the Liberals.

On Sept. 4, 1939, British aeroplanes bombed the city of Esbjerg by mistake, causing material damage. The Danish ship "Vendila" was sunk in the North sea and 33 ships were lost by April 1940.

King Christian X conferred with the other Scandinavian kings and with the president of Finland in Stockholm. Then, when the USSR attacked Finland, Denmark's sympathy was all with the latter. Danish volunteers participated in the war, and medical and other supplies were sent.

It was hoped that Denmark would be able to stay neutral, as in World War I. Precautions were taken to prevent violations of Danish waters by U boats, and a discussion in parliament on defense in Jan. 1940 resulted in a declaration from the government that Denmark would fight, if attacked.

In February came the "Altmark" affair in a Norwegian fjord, and controversies over the transport of iron ore from Sweden to Germany caused new anxiety. Although Germany at the end of Aug. 1939 had declared that Danish neutrality would be respected, Hitler in October discussed action against Scandinavia and in Jan. 1940 gave orders to make plans for the occupation of Norway and Denmark. The German interest was concentrated on Norway, but Denmark was included as the vital passage for the operation. Hørluf Zahle, the Danish minister in Berlin, reported rumours of German concentrations in Baltic harbours on April 4, and the departure of transport ships from Stettin on April 7. England and France on April 7 and 8 mined Norwegian waters, and at the same time German troops were reported on the move between Rendsburg and Flensburg. The government considered giving orders for mobilization, but the German minister Cecil von Renthe-Fink warned Munch against taking any measures that might provoke Berlin to retaliation. After consultations with the leaders of the parties the government decided not to mobilize the emergency army, but an order of readiness was issued to the navy. On the same day a German fleet went through the Great Belt. Two of the ships, the troop transport "Hansestadt Danzig" and the icebreaker "Stettin" went north of Zealand, then turned south and sailed through the Sound.

The attack was planned to begin on April 9, at 4 o'clock. At that time Renthe-Fink presented Munch with a memorandum (the 13 points) stating that England planned to occupy Denmark and that Germany was therefore forced to protect Danish territory but promised not to violate Denmark's integrity or political independence.

Simultaneously German troops crossed the border and landed at several points on the islands, where fighting broke out with Danish troops. German troops also entered Denmark's only naval harbour, Copenhagen. Ice had prevented the necessary patrolling and confusion in one of the forts at the harbour entrance allowed two German ships to enter without a shot being fired. Troops were landed, occupied the citadel and moved toward the Amalienborg palace, where fighting with the royal guards began.

The king and several of the ministers were discussing the ultimatum while German bombers were circling over the city. As help from England or France could not be expected, it was decided to

accept occupation under protest. The reaction of the people was a feeling of despair mingled with humiliation and resentment against the government and the army. The king's proclamation that order was to be maintained and conflict with the German troops avoided, was obeyed and normal life was gradually resumed.

The Danish people, generally pro British and for historical reasons antagonistic toward Germany, at first adopted an attitude of "wait and see" in view of the correct behaviour of the Germans. But the ostensible willingness to co-operate ceased and a period of passive resistance began when the Germans broke their promise not to interfere in Danish affairs.

A coalition government was formed on April 17, with Stauning as premier and the democratic parties in parliament formed a co-operation committee. The necessary collaboration with the Germans was established, and the necessary economic provisions were passed by parliament. Imports from the west were stopped and despite agricultural production stocks of food ran low. The requirements of the Germans led to severe shortages and structural rationing became necessary. Inflation was kept under control.

On April 9 the connection between Denmark and Iceland was broken, and on April 12 the Icelandic ministry took over the functions of the king. The Faeroe Islands were occupied by British troops on April 25, and the Danish minister in Washington, D. C., Henrik Kaufmann, laid the foundation for the U.S. occupation and protection of Greenland. During the summer there was extensive political unrest, primarily aimed at the foreign minister, who was blamed for the lack of military preparedness on April 9.

The government was reconstructed in July. Erik Scavenius, known for his pro German attitude as foreign minister during World War I, took over the portfolio of foreign affairs, and the industrialist Gunnar Larsen was appointed minister of traffic. On July 8 Scavenius issued a declaration promising co-operation with Germany. This led in the following weeks to negotiations on a customs and currency union, but the German proposals invariably involved Danish subservience to the German economy and the government in August succeeded in postponing the negotiations indefinitely. However, a Danish German association to promote cultural understanding was formed in August.

Passive resistance soon increased. The king's 70th birthday (Sept. 29) was made the occasion for loyal demonstrations. The minister of trade, Christmas Møller, leader of the Conservative party, was one of the first politicians to express Danish antagonism toward the conqueror. During the negotiations on the customs and currency union the first underground newspaper was printed.

In the autumn antidemocratic and pro-German forces tried their strength. A Nazi-infiltrated farmers' group and a group of industrialists and rightists attempted unsuccessfully to force a change of government. In November the Nazi party, under the leadership of F. Clausen, tried a coup that ended in utter failure. Around the New Year, 1941, the Germans tried in vain to have Stauning dismissed. However, they succeeded in forcing two leading Social Democrats to resign from their party posts and used the ensuing conflict to press the government into delivering a number of destroyers to the German marines.

From the beginning of 1941 the Germans increased their efforts to absorb Denmark into "the new Europe." They cajoled and threatened the press for a "positive" attitude, inaugurated a German scientific institute, and arranged journeys to Germany for editors, trade union leaders and others (though the majority of those invited found excuses not to go). A crisis arose in April, when Henrik Kaufmann, who from the beginning of the occupation had detached himself from the government, concluded the Greenland treaty with the United States; the government repudiated this step and dismissed him from office. In May Iceland dissolved the union with Denmark, not awaiting the time when negotiations would be possible.

The Communists had taken a benevolent attitude toward the occupation, but after the German attack on the USSR they were arrested and interned. The Communist party began made illegal. In July Danish volunteers joined "Frikorps Danmark" to participate in the war on the eastern front. This was officially approved by Scavenius but led, in connection with other tensions within

the ministry, to a crisis in July, when Scavenius threatened to resign.

In the autumn the Germans forced the government to sign the Anti-Comintern pact, which provoked the first serious anti-German demonstrations in Copenhagen. Opposition against the Germans increased in 1942. In April Christmas Møller and the Communist leader Axel Larsen, who had gone underground, founded the underground paper *Frit Danmark*. Christmas Møller fled to England in May and was elected chairman of the Danish council in London. His broadcasts strengthened the will to resistance, and the first saboteurs, trained in England, were parachuted into Denmark.

Gradually German irritation matured. In September, when Erik Røpke returned home on leave clashes between citizens and soldiers broke out because the population generally considered them traitors. Moreover the Germans were extremely annoyed at the flight of Christmas Møller and accused the Conservatives of duplicity. As sabotage increased their anger grew. Speeches and lectures by patriots won more and more resonance, and sentences of imprisonment only augmented their number and audacity.

The king's answer to a telegram from Hitler on his birthday was thought by Hitler to be too cold and unfriendly and was made the excuse for a change of action. Their German minister was recalled, the Danish minister in Berlin was handed his passport and for several weeks the Germans were completely silent as to the measures that they were going to take. Then they demanded the resignation of the Social Democratic prime minister Vilhelm Buhl (who had taken office on Stauning's death in May 1942) and the formation of a ministry that would actively collaborate with them. Scavenius, though he despised German and Danish nazis, never theless was convinced of Germany's strength; he accepted the premiership, but was received with resentment both among the people and in parliament.

A new German representative in Denmark was now appointed. Werner Best was reputed to be an intelligent nazi who wanted to restore quiet in Denmark and to be able to exhibit the country as a "model protectorate." In pursuance of this policy the Germans in March 1943 permitted an election for the *folketing*. The democratic parties fought the campaign on a closed front, there was an enormous poll and the result was a resounding defeat for Danish nazism. But Best could interpret the result as a victory for the government and his appeasement policy.

During the summer of 1943 Danish German relations grew progressively worse. Sabotage increased regardless of warnings from the king and from the prime minister. The Liberty council (*Frihedsraadet*) was formed by representatives of all groups participating in active resistance. After the fall of Italy general unrest prevailed.

In August violent riots broke out in several cities, followed by waves of sabotage. On Aug. 28 Best handed the government an ultimatum demanding proclamation of martial law and death sentences for acts of sabotage. Unanimously the government rejected the German ultimatum the same day. Next morning the German

mans accepted a compromise, by which the strike was called off and the German troops moved away from the city.

In September the Danish police, rightly suspected of helping the resistance, were arrested and sent to German concentration camps. From then on lawlessness and terror reigned. Several leaders of the resistance who had been interned by the gestapo in the Shell building in Copenhagen escaped when the building was destroyed by the R.A.F. (March 21, 1945), and the gestapo's archives disappeared in the flames.

From Feb. 1945, with the defeat of Germany in sight, thousands of German civilian refugees began to arrive in Denmark. On May 4, 1945, German forces in northern Germany, the Netherlands and Denmark capitulated, and the next day British troops moved over the Danish frontier. While the main part of Denmark was liberated by British troops, soviet troops moved into Bornholm, where on May 7 several places were bombed because the German troops refused to capitulate.

The Postwar Situation—A government under V. Buhl, which included members from the political parties and from the resistance movement, was appointed on May 5. During the summer parliament abolished all legislation enacted under German pressure and passed laws for the prosecution of collaborators and war criminals. In an election held on Oct. 30 the Social Democrats lost 18 seats, the Radical Liberals 2 and the Conservatives 5, while the Liberals won 10 and the Communists no less than 15. The Buhl ministry resigned and the Liberals formed a minority government under Knud Krastensen, with the diplomat Gustav Rasmussen as foreign minister.

During 1946 there were frequent strikes and often illegal ones, partly in support of demands for higher wages and partly because of dissatisfaction over the manner in which the prosecution of collaborators and war criminals was carried out. Another question that gradually brought the government into conflict with the majority in parliament was that of South Schleswig. After the liberation the government had declared that it would not seek immediate revision of the frontier and that it favoured self-determination for the Danish population of South Schleswig. But as pro-Danish sympathies manifested themselves there, groups in Denmark came to desire action toward recovering South Schleswig for Denmark, and the prime minister's speeches indicated his agreement with this policy. On Oct. 28, 1946, the *folketing* was dissolved. In the ensuing election the Social Democrats gained seats, while the Communists lost half of the number that they had had and the Liberals also lost some. Knud Krastensen resigned, and the Social Democratic leader Hans Hedtoft formed a new government. King Christian X died and was succeeded by his son Frederick IX in April 1947.

After 1945 the government's major problems were economic. New investment was necessary to bring production back to prewar levels, and occupation costs had to be liquidated. The 200,000 German refugees who stayed in the country until 1949 increased these difficulties. The Marshall plan was therefore of decisive importance for reconstruction. From the second half of 1948 economic prospects were better: production reached prewar levels and rationing was abolished for most goods.

When the United Kingdom devalued the pound sterling in Sept. 1949 Denmark likewise devalued the krone, and price developments began subsequently to work against Denmark. At the same time the liberalization of foreign trade entailed by membership of the Organization for European Economic Co-operation presented more worries. The Conservatives and the Liberals wanted to push liberalization but the government was reluctant.

An election in the summer of 1950 did not decisively alter the strength of the parties in the *folketing*, but shortly afterward the Hedtoft government was replaced by a coalition of Liberals and Conservatives under Erik Eriksen. Economic troubles continued and rearmament contributed to the growing deficit. The government introduced several measures to combat inflation and to limit imports, and early in 1952 there was some indication that the situation was beginning to improve.

Immediately after the war a delegation went to San Francisco to participate in the United Nations' conference. During 1945 and

ished between the Liberty council and the political parties.

The Germans, assisted by Danish traitors, formed terror groups (*Schalburghorps*), arranged countersabotage and murdered patriots, the so-called "clearing murders." In June 1944 the population of Copenhagen revolted and called a general strike (*folkestrejk*). For several days the situation was tense. The Germans shut public utilities off and threatened to bombard the city, the strike seemed likely to spread to the provinces. Finally the Ger-

1946 the South Schleswig question occupied a dominating place in foreign relations, but from the beginning of 1948 questions of defense and potential alliances began to overshadow all other issues. Denmark had hoped that the United Nations would inaugurate a period of international co-operation, and despite the increase in soviet power and the disillusioning developments in eastern Europe the Danish prime minister declared that his country would join neither a western nor an eastern bloc. But the Communists' coup in Czechoslovakia changed public opinion, and during the second half of 1948 Denmark, Norway and Sweden began negotiations for a defensive alliance. In Jan. 1949, however, these negotiations broke down, primarily because of Norwegian-Swedish disagreements.

The Hedtoft government suggested a Swedish-Danish defense arrangement, but this was rejected by the Swedes. Thereupon Denmark in April 1949 accepted the invitation to join the North Atlantic Treaty organization. This complete break with the traditional policy of neutrality was accepted by the majority of the people but was opposed by the Communists and, because of their belief in neutrality, by the Radical Liberals.

Denmark also joined the Council of Europe but rejected, together with England and the other Scandinavian states, the continental European policy in this body. The same attitude was taken toward plans for a European army. Although Scandinavian defense plans had broken down, Denmark still tried to develop Nordic co-operation. Negotiations for a customs union came to nothing, but in 1952 closer co-operation between the parliaments was planned.

POPULATION

The total population in 1950 was 4,281,275 (cf. 3,844,312 in 1940), with an average of 258 per square mile. The density in the islands is nearly twice that in the mainland. Against greater Copenhagen's 1,169,340 inhabitants in 1950 (800,130 in 1940), the next largest is Aarhus, had 110,167 (99,581), Odense 100,940 (87,321), Ålborg 79,806 (55,677) and Esbjerg 48,205 (33,155). Other provincial towns had not more than 40,000 each. The urban population in 1950 amounted to half the total that is to 2,107,817; for, with suburbs included, 2,424,360; whereas, in 1875 it constituted only one quarter the great concentration of the capital and the rapid growth of the larger provincial towns in the preceding decades accounted for most of this increase. The smaller provincial towns having been stagnating.

On the total population, 95% belong to the Lutheran church which was introduced as early as 1536. A there is complete religious toleration, the other important Christian communities

are represented, and 1% of the population is of no confession. The king must be a Lutheran. The primate is the bishop of Copenhagen, and there are nine dioceses.

Employment—Agriculture or fisheries provided the living, directly or indirectly, of 1,065,000 persons in Denmark in 1950, handicrafts and industry that of 1,285,000, commerce and finance that of 485,000, transportation that of 248,000, and administrative and intellectual occupations that of 268,000. Classified as "economically inactive" were 420,000. (Figures include children and dependents.)

At the opening of the 20th century unemployment was about 10% (annual average). In 1913 it had sunk to 7.3%, but it increased to 18.1% in 1918 because of the deterioration of Danish economy during World War I. In the 1920s the average unemployment was 16%, and during the international depression in the early 1930s it rose further to 25%-30%. It had sunk to 18.4% in 1939 but increased to 23.9% the next year on account of the situation created by World War II. It sank to 8.7% (annual average) in 1948 but rose slightly, to 9.6%, in 1949. As, however, much work in Denmark is seasonal, a truer picture of unemployment will be found in the monthly percentages than in the annual average. The maximum monthly percentage in 1949 was 18.2 (December), the minimum 4.7 (June). In fact, Denmark had full employment in the later 1940s. Moreover, social insurance alleviated the difficulties of the unemployed after World War I. (E. E. E., H. L. N.)

GOVERNMENT AND ADMINISTRATION

Constitution—The constitution of Denmark is laid down in the act of June 5, 1915, amended in 1920 on the restoration of North Schleswig in accordance with the treaty of Versailles. Legislative authority rests jointly with the crown and parliament, the executive power is vested in the crown, while the administration of justice is exercised by the courts. Parliament consists of two chambers, the *landsting* (senate) and the *folketing* (lower house). The franchise is held by all persons over 25 years of age. The members of the *folketing* numbered 135 (including 2 from the Faeroe Islands) in 1951; they are elected for four years. Of the members of the *landsting*, 57 (including one from the Faeroe Islands) are elected by the votes of the *folketing's* electors who are over 35 years of age, while 10 members are elected by the former *landsting*. The *rigsdag* (parliament) must meet every year on the first Tuesday in October. The privy council is the highest executive power in the state, it deals with all new bills and all important government measures. For administrative purposes there are 22 *amter* (counties), each of which is under the superintendence of a governor. Local government is largely in the hands of the municipal councils.

Education—Since 1814 education has been compulsory for those between 7 and 14 years. The school laws of 1937 made this instruction free. However in 1949 only 35 of these schools were government institutions, 3,713 were maintained locally and 364 were private. Teachers are trained in about 20 teachers' schools. After five years of elementary instruction, a pupil may receive four years of secondary education and may then proceed to a high school, of which there were about 430 at mid century. Here there is a choice between classical, modern-language and scientific courses terminated by a state examination. There are approximately 60 popular high schools for adults, all private but assisted by the state. For specialized study there were 27 agricultural schools at mid century (one including veterinary courses), two dairy schools, more than 200 commercial schools and more than 300 technical schools, as well as institutions for dentistry, pharmacy, music and art. Copenhagen university was founded in 1479 and had about 6,000 students in 1950. Aarhus university, founded in 1928, had about 1,500 students. Women are received on a parity with men in all departments. There are 1,300 public libraries.

Defense—The principle of national conscription was adopted in 1849. Recruits are enrolled at 17 and receive instruction of at least 18 months between the ages of 19 and 25. Liability to call extends over 16 years, in two classes.

During the German occupation 1940-45 the Danish army was dissolved and its equipment taken over by the Germans. Having joined the North Atlantic Treaty organization, however, Denmark started to rearm. The Army act of 1951 brought the total strength of the army under war conditions to 100,000 men, that of the home guard to 40,000. The navy was by 1954 to comprise smaller vessels for coastal guard, motor torpedo boats, mine layers and mine sweepers, escorting vessels and submarines, the air force, nine squadrons of fighters.

ECONOMICS

Agriculture—One of the most significant facts of the Danish economy is the high ratio of productivity of the land: 90% is productive and 75% actually farmed (3,145,000 ha in 1950).

Farm Holdings—Denmark possesses an unusually large number of freehold farms—95% as against 5% rented. In the first half of the 20th century a trend toward tenancy could be discerned in many countries but Denmark proceeded in the opposite direction. The conscious governmental attempt to subdivide large farms and to establish agricultural workers on independent holdings began with the legislation of 1899 and was reinforced by the three land laws of 1919 and by the acts of 1933, 1934, 1948 and 1949. Co-operatives helped to make small farm operation profitable, and animal husbandry, a prominent feature of its activity, also lent itself to small individual enterprise.

The Small Holdings acts and the agricultural expansion of the country resulted in the subdivision of large estates, the parcelling out of glebe land and the abolition of leasehold. Tiny parcels were added to other small holdings or enlarged by land from larger farms. The steady growth of independent small farms under the law of 1899 and its amendments is shown in Table I.

TABLE I—Increase of Small Farms Under the Act of 1899 and Its Amendments

Year	Number	State loans and grants
1900-10	5 093	31 300 000 Kr.
1910-20	4 171	28 400 000 Kr.
1920-30	5 320	70 600 000 Kr.
1930-40	7 893	49 400 000 Kr.
1940-49	878	13 300 000 Kr.
Total	18 433	185 200 000 Kr.

The addition of the 7,203 farms established under the acts of 1919 brought the aggregate number (1900-49) of newly established farms under the Small Holdings acts to 25,626. State loans to farms established under the acts of 1919 amounted to 96,300,000 Kr., bringing the total of state loans and state grants to small holding farms (1900-49) to 281,500,000 Kr.

Purchasers under the acts of 1919 of glebe land, fiefs or estates paid no purchase sum but only an annual interest to the government. In effect these holders become owners.

The distribution of farms according to size is shown in Table II. The total of farm holdings in July 1946 was 208,147, representing a notable increase over the 171,495 of 1903. However, it must be remembered that the acquisition of South Jutland in 1920 added 14,364 farms.

Production and Marketing—During the period from 1875 to 1950 Danish agricultural production increased rapidly, though World Wars I and II and the agricultural depression in the early 1930s brought some temporary falling off. The crop yield increased 250%, mainly through the purposeful application of science in the breeding of plants and a more enlightened use of manure and fertilizers, apart from expansion of the area cultivated. The increase of crop yield is shown in Table III.

In Table III statistics include the crops of grain, hay, potatoes, fodder, beets, sugar beets and chicory roots, but not green fodder, the crop of which in 1949 was estimated at 36,500,000 hectokilos of barley, thus bringing the aggregate crop yield in 1949 to 129,800,000 hectokilos of barley.

Barley and oats in 1949 accounted for about 80% of the total grain crop, which was 41,130,000 hg. Fodder beets made up about 80% of the root crops, which in 1949 totalled 246,610,000 hg. Production of hay amounted to 78,000,000 hg.

TABLE II—Distribution of Farms According to Size

Size in hectares	Number		Agricultural area 1940 (thousand hectares)
	1923	1946

200 and more	424	265	24.1
Total	300 973	308 217	3 177.2

The increase of harvest yield together with the importation of grain and feeding stuffs, the latter in 1949 amounting to 324,000,000 Kr., made the Danish specialization in animal husbandry possible. The rise in the livestock production, which began in the 1880s, must also be attributed to the application of science in

breeding and to improved methods in feeding and care. Its progress is shown in Table IV.

As is apparent from Table IV, World Wars I and II injured the industrialized agricultural economy seriously. The intensive sub-marine activity in the last two years of World War I and the German occupation of Denmark in World War II made the importation of grain, feeding-stuffs and fertilizers difficult or impossible, consequently the number of farm animals was reduced. The

TABLE IV—Number of Farm Animals (In thousands)

Year	Horses	Cattle (total)	Cows	Pigs	Sheep	Poultry
1881	375	1 638	681	597	1 612	5 000

†Figures for 1946

stocks of horses and cattle of course fluctuate less widely than those of pigs and poultry, which can be adjusted very quickly to changing conditions. The peak in livestock production was reached at the beginning of the 1930s, the number of pigs being 5,453,000 in 1931, but the international agricultural depression of that time caused a severe reduction. The increase in number of horses during World War II was the result of shortage of fuel, but after the war tractors took the place of thousands of horses.

During World Wars I and II not only the number of cows, but also the yield of milk per cow was drastically reduced. It fell from 2,750 kg in 1914 to 1,810 in 1919 and from 3,295 in 1938 to 2,323 in 1942. In 1949 the milk yield per cow reached 2,994 kg, and by 1951 it was estimated to be near that of 1938. However, the milk's percentage of butterfat rose so that 22 kg of milk were used for producing 1 kg of butter in 1949 as against 23.6 kg in 1939. Nevertheless butter production fell from 183,000,000 kg in 1939 to 109,000,000 kg in 1942, though in 1950 it came up to the level of 1939.

The aggregate production of animal husbandry showed in 1950 the following figures (in parentheses the annual average for

1935-39) milk 5,400,000,000 kg (5,270,000,000), butter 179,000,000 kg (180,000,000), cheese 59,000,000 kg (33,000,000), meat of oxen and calves 170,000,000 kg (176,000,000), bacon pork fillets etc 357,000,000 kg (329,000,000), eggs 132,000,000 kg (120,000,000).

In 1913 Denmark exported agricultural produce worth about 550,000,000 Kr, about 97% of which was made by animal products. The value of agricultural products exported rose to 1,174,000,000 Kr in 1927, more than double that of such exports in 1913, by 1930 it had risen to 2,826,000,000 Kr, 95% of which was made by animal products. (See Table V)

TABLE V—Export of Animals and Animal Products

Both change and increase in the agricultural and animal products and their export between 1910 and 1949 were largely the result of demand in the foreign market—especially in the British, to which Denmark shipped by far the greater portion of her produce. In World War II, however, Germany was the main importer of Danish agricultural products. (See Table VIII)

Co-operatives—Agricultural production and marketing in Denmark undoubtedly owed much to the growth of farm organizations. Associational promotion began as far back as the founding of the Royal Agricultural society (1769), and both it and numerous special societies stimulate breeding and other improvements. By 1930 local farmers' associations had 141,000 members and smallholders' societies 114,000 members, each group in a national federation. The national federation of farmers' associations established a joint organization with the Federation of Danish Co-operative Societies known as the Agricultural Council (*Landsbrugsrædet*). This council and the national federation of smallholders' societies represent agriculture in dealings with the government and with industry and in foreign trade. Numerous co-operative societies flourish, and in the important dairy and bacon business they dominate the scene. In 1930 there were 1,566 dairies, of which 1,321 were co-operative societies, and 61 co-operative bacon factories. About 85% of all cows belong to dairy farms that are members of the co-operative organization, and 15% of the pigs belong to the 70% of farm members of the bacon-factory co-operative. Only about 30% of the egg production is co-operatively organized, but even this is of great importance in the maintenance of standards for the export trade. The extraordinary success of the Danish farmers in managing their co-operative societies, following the establishment of the first dairy co-operative society in 1882, resulted largely from the spread of adult education and especially the folk high schools.

Financial Returns—After the long period of depression at the close of the 19th century prices improved, and the relatively few financial accounts available for the years 1910-13 show an average yield of interest on capital invested in well-managed farms of about 4%-5%. During the first years of World War I the prices of corn and seed, as well as of live animals and meat, rose considerably, increasing the capital yield for large and middle-sized farms. In the later years of the war, prices of eggs, bacon and dairy products rose, increasing the returns on small farm investment, so that the average yield of interest rose to 8.3% in 1918-19. A sharp decline to 0.9% occurred in 1921-22, and in the following ten years the average yield of interest was from 1.1% to 6.4%. The international agricultural depression brought an average loss of 0.4% on agricultural produce in 1931-32, when

the depression was overcome the average yield of interest rose to 3.8% in 1939-40. Rising prices during World War II increased the interest to 7.1% in 1940-41 and to 6.6% in 1943-44, but much of this increase was also caused by reduction of live stocks (see Table IV). When the reduction was stopped after the war and prices were reduced the average yield of interest dropped to 2.3% in 1945-46. As the result of a very good harvest in 1948, increased prices and a considerable rise in live stocks, the interest rose to 6.5% in 1948-49.

Fisheries—In the course of the 19th century the fisheries were rejuvenated as an export industry through improvements in means of transportation and expansion in Icelandic and Greenland waters. In 1940 Denmark had 7,513 rowboats, 743 subboats and 7,640 motorboats. The fish market of Copenhagen, which contributed largely to that city's supremacy remains a visual and olfactory memory to visitors. About 20,000 persons were directly engaged in fishing in 1950 and numerous others were dependent on it: workers in herring oil factories, merchants, netmakers, boat builders and motor makers (most of the motors and gear are manufactured in Denmark). Both the quantity and the value of the total haul increased after 1900. The value is shown in Table VI.

TABLE VI—Total of Fisheries (In million kroner)

	1908	1918	1928	1938	1940
North sea, Iceland and Greenland waters	3.3	12.0	15.2	21.6	100.4
Lamford	1.7	3.0	2.4	1.7	5.3
Inner waters (east and south of the Scaev)	0.9	6.7	19.1	19.3	71.9
Total	5.9	21.7	36.7	42.6	177.5

The quantitative yield of fisheries in 1949 was 227,000,000 kg consisting largely of plaice (flatfish), with cod, herring, mackerel eel and haddock following in order of importance, of this total 127,000,000 kg were exported usually fresh, ice packed or live. Coastal fishing supplies mostly cod, plaice, eels, herring and mackerel, while deep sea fishing yields cod, plaice and haddock.

The fishermen have marketing and purchasing co-operatives, though not on the same scale as the farmers' societies.

Other Industries—Compared with agricultural produce and fisheries, the natural resources of the country are of minor importance. Though coal is found in Bornholm, neither coal nor metals can be profitably mined anywhere. Extensive strata of bog iron ore in Jutland are used for purifying purposes in gas works. The newer chalk is utilized in lime burning and also forms the basis of an important cement industry. Tertiary and glacial clays are used in the tile industry, while calcareous deposits of clay have been widely utilized, particularly in Jutland, for soil improvement. Bornholm supplies granite for building and paving and kaolin for the china and paper manufactures.

Danish industry produces primarily for home consumption, though certain products, such as diesel motors, steam and motor ships, dairy and agricultural machines, refrigerators, cement machines, Portland cement, sugar, pharmaceutical products and electrical equipment, are exported in large quantities. Though there are no iron mines there is a large casting and machine-building business. Textile manufacturing is important for the home market, as are margarine factories and the breweries (which also export). Bicycles are also manufactured and provide the most popular transportation for Copenhageners.

In the 1930s and the 1940s the export of industrial produce was increasing rapidly, and in 1950 it provided 1,537,000,000 Kr or 33% of the aggregate Danish export.

The metal industries employ the most workmen (130,000), food processing employs 85,000, earthworks and building 102,000, textile and footwear industries and clothing 97,000, woodworking 41,000, and chemicals 30,000. About one-quarter of the total number of industrial workers are women. The internal wholesale trade employed about 84,000 in 1945, retail establishments 188,000, and cafes and restaurants 46,000.

Table VII shows the development of handicraft and industry.

TABLE VII—Handicrafts and Industries

	1907	1911	1925	1935	1948
Number of establishments	77 256	82 404	89 189	102 013	109 288

Commerce and Shipping—The per capita rate of Denmark's foreign commerce is exceptionally high. This commerce depends especially on Great Britain, to which Denmark in the first three decades of the 20th century sent about 60% of its exports. In the years just prior to 1940 the proportion of trade with Britain declined slightly because of the "Buy British" policy inaugurated in the United Kingdom in the early 1930s and never completely overcome by trade agreements. Conversely, trade with Germany increased somewhat after 1930 because of German military and economic preparations, and during the German occupation of Denmark in World War II most Danish exports were sent to Germany or to German controlled territories. After the war trade with Great Britain was resumed and the United Kingdom again became the main purchaser of Danish exports. Details are given in Tables VIII and IX.

TABLE VIII—Imports and Exports, Value and Distribution

Value in million kroner			Distribution 1950 (in percentages)		
Year	Imports	Exports	Country	Imports	Exports
1913	855	721			
1917	1,080	1,066	Great Britain	11.8	43.0
1920	1 448	1 496	Germany	3.3	7.1

1949	4 112	3 559	World	100.0	100.0
1950	5 597	4 519			

Denmark's favourable position for shipping gives it a large mercantile marine in proportion to its population, with 300 tons per 1,000 inhabitants in 1950, the aggregate tonnage being 1,307,000 tons. The number of steamships fell from 651 in 1915 to 311 in 1950, but motor ships increased from 27 to 348 and combination sail motor ships from 370 to 1,412. Sailing vessels of more than 20 tons had almost disappeared, dropping from 870 to 3. Denmark was one of the leaders in the modern transition to motor ships, building them both for itself and others in its diesel works. Danish vessels carry about three fifths of the country's sea-borne trade and do a large foreign business, which in 1950 rendered a net amount of about 475,000,000 Kr.

Communication—Regular connection with England is by sea from Esbjerg to Harwich. There are ferry passages for travellers and trains from Gedser to Warnemünde (eastern Germany) and to Grossenbrode (western Germany) and Swedish services from Copenhagen to Malmö and from Elsinore to Helsingborg. Elsinore and Helsingborg also form a link in communications with Norway, another line being from Frederikshavn (to Oslo). The main land route is the railway via Padborg and Schleswig to Hamburg. Denmark possesses about 5,000 km of railways, nearly half of this total belongs to the state, and the state and the larger towns hold nearly all the shares in the "private" lines. There are highly organized tram-ferry schemes for communication between Zealand and Fyn and between Zealand and Jutland. A bridge (800 m) connects Fyn and Jutland, and another bridge (3,200 m) connects Zealand and Falster. Motor transport is highly developed, the number of motorcars was 169,194, of motorcycles 16,691 in 1949, and the total length of principal roads was 8,162 km, of byroads 44,854 km. Copenhagen is a centre of international air traffic. S.A.S. (Scandinavian Airlines System), a joint Danish, Norwegian, Swedish enterprise, serves European and intercontinental lines.

Finance, Exchange and Banking—After World War I ended in 1918 Denmark experienced a great credit expansion, due to loans abroad and to the state internally, to the demands of a

TABLE IX—Principal Commodities Imported and Exported

			Machines	715	318
			Vehicles ships etc	233	117

refreshed trade and to the development of South Jutland. The krone fell below par and it required steady state policy to bring it up to its gold parity by Jan. 1, 1927. Agriculture suffered but was able to weather the difficulties caused by this deflation. Then the British pound sterling collapsed in Sept. 1931, and the Danish krone was affected with it. From that time until 1940 Denmark adjusted its currency as well as possible to the pound sterling, as one of the so called sterling bloc. During this period state regulation of the imports was required to prevent the krone from falling below the rate of 22 1/2 Kr. to the pound sterling. During the German occupation from 1940 to 1945 financial relations with Great Britain and the pound were severed, but after the liberation in May 1945 Denmark again attached itself to the sterling bloc. The exchange rate was now 10 3/16 Kr. to the pound sterling and was maintained when the British pound was devalued in Sept. 1949, the krone being devalued with the pound.

The Nationalbanken had been compelled to finance the German occupation, issuing about 8,000,000,000 Kr. from 1940 to 1945. About 3,000,000,000 Kr. were confiscated through extraordinary taxation in 1945-46, but the remainder of the issue, together with a credit expansion in order to modernize industries and handicrafts and to make possible the importation of necessary goods, caused an inflationary development of prices, so that state regulation of foreign trade and of prices had afterward to be maintained.

The old joint stock private National bank, successor to the Rigsbank founded in 1813, was reorganized in 1936 as Nationalbanken. It is the only bank of issue and is controlled by a board of governors (25) who are chosen by the government, the *rigsdag*, the ministry of trade and by the board itself. At mid 20th century there were three large private banks and 158 smaller ones, the three large ones doing about one-half the total business. There were 506 savings banks, with deposits, in 1949, of 4,845,000,000 Kr. The Bourse is in Copenhagen. Insurance companies several dating from the 18th century, do a large business abroad as well as at home.

DENNEWITZ, a village of Germany, in the Prussian province of Brandenburg, near Jüterbog, 40 mi SW from Berlin. It was the scene of a decisive battle on Sept. 6, 1813, in which Ney, with an army of 58,000 French, Saxons and Poles, was defeated with great loss by 50,000 Prussians under Bulow and Tauentzien.

DENNIS, JOHN (1657-1734), English critic and dramatist, was born in London, and educated at Harrow and Cambridge. After travelling for some time on the continent he settled in London, and obtained, through the patronage of the duke of Marlborough, a small place in the customs, which he sold for a small charge covering a long period of years. His first successful plays were *A Plot and No Plot* (1697), a satire on the Jacobites, and *Rinaldo and Armida* (1699), and *Liberty Asserted* (1704). *Appius and Virginia* (written 1705 and produced at Drury Lane 1709) was satirized by Alexander Pope in the *Essay on Criticism*.

Appius reddens at each word you speak,
And stares tremendous with a threatening eye,
Like some fierce tyrant in old tapestry

Dennis replied in 1712 with *Reflections on the Essay*, and the quarrel was pursued in a series of pamphlets provoked by various incidents. He also quarrelled with Joseph Addison, and published *Remarks upon Cato* (1713), which drew from Pope the *Narrative of Dr Robert Norris, concerning the strange and deplorable Frenzy of John Dennis* (1713). In the end Pope and Dennis were reconciled, and exchanged friendly letters. But Dennis' best claim to remembrance lies neither in his plays nor in his literary quarrels but in the body of his, on the whole, sane critical work. He had the prejudices of his time, and is tiresomely insistent on poetical justice.

The most important of his critical works are *The Advancement and Reformation of Modern Poetry* (1701), *The Grounds of Criticism in Poetry* (1704), and *An Essay on the Genius and Writings of Shakespeare* (1712).

Dennis' *Miscellaneous in Prose and Verse* were collected in 1693. See H. G. Paul, *John Dennis, His Life and Criticism* (New York, 1912), and Elwin and Courthope's *Works of Pope* (1771-79).

DENNISON, a village of Tuscarawas county, Ohio, U.S.A., 80 mi S by E of Cleveland, on federal highways 36 and 250 and the Stone fork of the Tuscarawas river, served by the Penn sylvania railroad. The population was 4,435 in 1950 and 4,413 in 1940 by the federal census.

DENOMINATION, the giving of a specific name to anything, hence the name or designation of a person or thing (Lat *denominare*, to give a specific name). In arithmetic it is applied to a unit in a system of weights and measures, currency or numbers. The most general use of "denomination" is for a body of persons holding specific opinions, usually religious, and having a common name, or for the various "sects" into which members of a common faith may be divided. "Denominationalism" is thus the principle of emphasizing the distinctions, rather than the common ground, in the faith held by different bodies professing one sort of religious belief. This use is particularly applied to that system of religious education by which children belonging to a particular religious sect are instructed in the tenets of their belief by members belonging to it and under the general control of the ministers of the denomination.

DENON, DOMINIQUE VIVANT, BARON DE (1747-1825), French artist and archaeologist, was born at Chalon sur-Saône on Jan. 4, 1747. He studied law in Paris, and in his twenty-third year produced a comedy, *Le Bon Père*, which obtained a *succès d'estime*. Louis XV entrusted him with the collection and arrangement of a cabinet of medals and antique gems for Madame de Pompadour, and appointed him attaché to the French embassy at St Petersburg. On the accession of Louis XVI Denon was transferred to Sweden, but he returned, after a brief interval, to Paris with the ambassador de Vergennes, who had been appointed foreign minister. In 1775 Denon was sent on a special mission to Switzerland, and visited Voltaire at Ferney. He made a portrait of the philosopher, which was engraved and published on his return to Paris. He spent seven years (1780-87) at Naples, first as secretary to the embassy and afterwards as *chargé d'affaires*. After a brief interval spent in Paris he returned to Italy, living chiefly at Venice. During the Revolution he returned to Paris, where he was protected by his friend the painter David. At Bonaparte's invitation he joined the expedition to Egypt, and there made numerous sketches of the monuments of ancient art, sometimes under the very fire of the enemy. The results were published in his *Voyage dans la basse et la haute Égypte* (2 vol fol, with 141 plates [Paris, 1802]). From 1804 to 1815 he was director-general of museums. He accompanied Napoleon in his expeditions to Austria, Spain and Poland, advising the conqueror in his choice of spoils of art from the various cities pillaged. He died in Paris on April 27, 1825. He left unfinished a history of Egypt.

and the metre. In precise work the difference ($1 \text{ ml} = 1.000028 \text{ cc}$) must be kept in mind.

The symbol d is frequently used to represent the density while the symbol d_{44} represents the specific gravity (the weight of a given volume of substance at temperature t , divided by the weight of an equal volume of water at temperature t_4). d_{44} is identical with the density in grams per millilitre.

Temperature and Pressure Effects.—In general, an increase in temperature or a decrease in pressure results in a decrease in density. These effects are large for gases so that both the temperature and the pressure must be taken into account in determining and reporting the density. The effect of moderate changes in pressure on the density of liquids or solids may be ignored, but the effect of temperature must always be taken into account.

Determination of the Density of Liquids.—Pycnometer Method.—The density may be calculated readily from the weight of liquid required to fill a vessel of known volume. A pycnometer is a vessel that can be filled with precision, is easy to clean and weigh and can be brought to a uniform temperature. Five conventional forms of pycnometer fulfilling these requirements are illustrated in figs 1 to 5.

The quantities required to determine the density of a liquid are (a) W_p , the weight of the empty pycnometer, (b) W_{pw} , the weight of the pycnometer filled with water or other liquid of known density, and (c) W_{pl} , the weight of the pycnometer filled with the liquid whose density is to be determined.

The density of the liquid d_l is calculated from the relation

$$d_l = \frac{M_l}{V} \quad (1)$$

where M_l is the mass of the liquid filling the internal volume V of the pycnometer. This volume is in turn obtained from the mass M_w of the liquid of known density d_w required to fill the pycnometer

$$V = \frac{M_w}{d_w} \quad (2a) \quad \text{since } d_w = \frac{M_w}{V} \quad (2b)$$

The masses M_l and M_w are obtained from the observed weights W_{pl} , W_p , and W_{pw} by correcting for the difference between the buoyant effect of the air on the contents of the pycnometer and on the weights used to balance the contents. If the density of the air σ does not change between the time of weighing the empty pycnometer and the time of weighing the pycnometer filled with liquid,

$$M_l = (W_{pl} - W_p) + \left(V - \frac{W_{pl} - W_p}{\Delta} \right) \sigma \quad (3)$$

where Δ is the density of the weights used. Similarly,

$$M_w = (W_{pw} - W_p) + \left(V - \frac{W_{pw} - W_p}{\Delta} \right) \sigma \quad (4)$$

The difference in density between the unknown and standard liquids is obtained by subtracting equation 2b from equation 1

$$d_l - d_w = \frac{M_l - M_w}{V} \quad (5)$$

Substituting in the values for M_l and M_w (equations 3 and 4) and simplifying,

$$d_l - d_w = \frac{W_{pl} - W_{pw}}{V} \left(1 - \frac{\sigma}{\Delta} \right) \quad (6)$$

This form of the equation is most convenient where small differences in density are being determined as in isotopic analyses. The volume V is obtained by combining equations 2a and 4 and need be calculated only to the precision required by the density difference. The factor $(1 - \sigma/\Delta)$ has the numerical value 0.99986 when σ is $1.2 \text{ mg per millilitre}$ and Δ is 8.4 (brass weights) and may be neglected therefore if errors as large as 2 parts in 10,000 in the density difference can be tolerated.

In the above discussion it has been assumed that the density of the air has remained constant throughout the weighing operations. If this is not true, equations 3 and 4 must be modified to take into account the true air density prevailing during each

weighing operation. The effect of the buoyancy of air may be eliminated entirely by using a tare of approximately the size and weight of the filled pycnometer.

Sinker Method.—A hollow glass cylinder with closed hemispherical ends that can be suspended from a balance pan by means of a wire forms a convenient sinker for density determinations. It is necessary to load the sinker so that it will sink in any liquid whose density is to be determined.

When a sinker is weighed suspended in a liquid, the buoyant effect of the surrounding liquid is equivalent to an upward force on the sinker equal to the mass of liquid displaced. If this upward force is determined (the apparent loss in mass of the sinker on being immersed in the liquid) and the volume of the sinker is known, the density may be calculated from equation 1. The sinker is weighed (a) in air (W_a), (b) suspended in water (W_w) and (c) suspended in the liquid (W_l). The first and second weighings serve to determine the volume of the sinker and the first and third weighings determine the mass of an equal volume of liquid. By considering these weights in the same manner as in the case of the pycnometer, it can be shown that if the liquid and water are at the same temperature,

$$d_l - d_w = \frac{W_w - W_l}{V} \left(1 - \frac{\sigma}{\Delta} \right)$$

V may be calculated from the relation

$$V = \frac{W_w - W_a}{d_w - \sigma} \left(1 - \frac{\sigma}{\Delta} \right)$$

(1) As in the pycnometer calculations the factor $(1 - \sigma/\Delta)$ may be neglected in most cases.

The sinker method is much more convenient than the pycnometer method for determining the density of a liquid at a sequence of temperatures. If the sinker has not quite attained the temperature of the surrounding liquid, the resulting error is of much

FIG 6.—WESTPHAL BALANCE

less consequence than if the liquid inside a pycnometer has not attained the temperature measured outside.

N S Osborne, E C McKelvy and H W Bearce investigated the densities of mixtures of ethyl alcohol and water using both the pycnometer and sinker methods. Their work might be consulted for details of both methods.

The Westphal balance is an application of the sinker method in which the upward force on a sinker is measured directly on a balance of the steel yard type. The balance is shown diagrammatically in fig 6. Such a balance is usually provided with three sizes of weights, the largest having a value in grams numerically equal to the volume of the sinker in millilitres, the next size have one tenth this weight and the smallest one one-hundredth. The positions of the heaviest weights on the balance arm give the units and first decimal place of the density, the position of the next smaller weight gives the second decimal place and that of the smallest the third decimal place. A chromatic balance may be used conveniently in place of the balance illustrated.

The chief error in the sinker method is the uncertainty concerning the surface tension effects on the supporting wire. This

FIG 7.—PROFESSOR A POLLARD'S TOTAL IMMERSION INDICATING HYDROMETER

FIG 8—PROFESSOR FOULK'S CHAIN HYDROMETER

A is an ordinary 50 cc graduated cylinder or better, a cylinder that has not been graduated B is a graduated tube, 20 cm long and 1.8 mm in inside diameter, bearing 130 marks 0.75 mm apart C is a rubber stopper

effect is minimized by using a fine wire and by treating it in a way that will assure the wire's being wet by the liquid. Platinum wires are usually coated with a light layer of platinum black. To avoid this error completely two types of totally submerged sinkers have been developed. A Pollard devised the type shown in fig 7. It is a specially designed float A which is supported on a flat surface BC by a small sphere D fused on the float. When wholly immersed in a liquid the float is free to rotate in a vertical plane about D and takes up a position of rest in which its inclination to the horizontal is dependent on the density of the liquid.

The chain hydrometer, fig 8, designed by C W Foukl, consists of a float to which is attached a light chain. The other end of the chain is fastened to a hook on a movable cylinder B. This cylinder is graduated, and the position of the float with respect to the graduations measures the density of the liquid in which the system is immersed.

For the determination of small differences in the deuterium or heavy oxygen concentration in water a method sensitive to changes of 1 part per 1,000,000 or less in the density is required. One such method consists in determining the temperature at which a suitable float will neither rise nor sink when immersed in the liquid under investigation. A difference of 0.005° C in the temperature of floating equilibrium may correspond to a difference in the density of 1 part per 1,000,000 at 25° C. One advantage of this method is the small volume of liquid required since the sensitivity is independent of the size of the float. Densities of samples as small as one-tenth millilitre have been determined using floats the size of a grain of wheat. The technique and methods of calculation are discussed by M. Randall and B. Longtin.

Floats sensitive to slight changes in external pressure have also been used to determine small density differences. Here the pressure at which the float will neither rise nor sink at constant temperature is a measure of the density.

Hare's Method.—A long inverted U tube is held with one limb (A) dipping into a liquid and the other limb (B) dipping into a second liquid. By applying suction to a branch tube at the top of the U each of the limbs is partially filled with liquid. If d_1 is the density and h_1 the height of the liquid in A, and d_2 and h_2 are the density and height in B, then

$$d_2 = d_1 \frac{h_1}{h_2}$$

The method of balancing the pressure resulting from columns of liquids of different densities has been used in sensitive density measurements by O. Frowd.

Effect of Dissolved Air.—It has been shown that the difference in density between water saturated with air at atmospheric pressure and air free water is of the order of 1 to 2 parts per 1,000,000. This difference may be neglected except in work of unusual sensitivity. However, air is 10 to 100 times more soluble in organic liquids than it is in water. In the case of such liquids a statement indicating whether the sample tested was air-saturated

or air free must be included if the density is to be defined more accurately than one unit in the fourth decimal place.

Temperature Control.—The coefficient of expansion of most liquids and solutions lies in the range 0.0005–0.002 reciprocal degrees at room temperature. The temperature therefore must be defined within at least 0.1° C if densities are desired to a few parts per 10,000, to within 0.01° C if densities are desired to a few parts in 100,000, etc. In order to avoid the difficulties of accurate temperature measurement, use is made of companion or twin pycnometers (or sinkers) which contain (or are suspended in) the reference liquid. So long as the liquid of unknown density is at the same temperature as the reference liquid the true temperature need not be accurately known although it must be constant to within the limits indicated above.

Density of Solids.—With gases, liquids and nonporous solids there is no question as to the meaning and application of the definition of density previously given. With porous solids it is desirable to distinguish between true density, apparent density and bulk density. The bulk density of substances like sponge rubber would be determined from their masses and dimensions. For a substance like powdered charcoal the bulk density would be obtained from the mass required to fill a container of known volume. The apparent density might be determined by displacement of some liquid or gas as described below. The results will vary over a wide range depending on the degree of penetration of the liquid into the pores of the solid. Using mercury as the displaced liquid the values obtained would approach the bulk density since mercury has little penetration. Use of *n*-pentane would yield values approaching the true density.

The compression of the liquid (or adsorption of a gas) in the pores of the solid also affects the experimental values. The true density would be the density of the solid component of the porous body.

Determination of the Density of Solids.—Pycnometer Method.—In this method the volume of a known weight of solid is obtained from the diminution in the capacity of a pycnometer to which the solid has been added. Four weights are involved: W_p , the weight of the empty pycnometer, W_{ps} , the weight of the pycnometer and added solid, W_{p+L} , the weight of the pycnometer, added solid and liquid then required to fill the pycnometer, and W_{p+L} , the weight of liquid required to fill the pycnometer with no solid present. If d_1 is the density of the liquid used, then d_s , the density of the solid, is given by the relation

$$d_s = \frac{W_{ps} - W_p}{W_{p+L} - W_p - W_{p+L}} (d_1 - \sigma) + \sigma$$

The method is convenient for solids available in small fragments or powders when a pycnometer such as that shown in fig 1 is used. The error resulting from entrapment of air in the powders may be avoided by filling the pycnometer under reduced pressure.

By Weighing the Solid in Air and also Suspended in a Liquid.—If W_a is the observed weight of a solid in air and W_l its weight when suspended in a liquid of density d_l , then the density of the solid is

$$d_s = \frac{W_a}{W_a - W_l} (d_l - \sigma) + \sigma$$

If the solid has a density greater than that of the liquid the solid is suspended in the liquid by means of a fine wire whose weight is allowed for. If the density of the solid is less than that of the liquid, a suitable weight must also be attached to the suspension so that the whole system will be immersed. In this case, W_l in the equation above would be the difference between the weight required to balance the submerged wire, solid and added weight less the weight of the submerged wire and weight alone.

Flotation Method.—In this method the density of a liquid is adjusted, e.g., by mixing two liquids of different density in appropriate proportions until the solid remains suspended in the liquid, neither rising nor sinking. Methylene iodide (density 3.3 gm per millilitre) and benzene (density 0.89 gm per millilitre) are con-

venient liquids for mixing together to obtain intermediate densities.

Very accurate densities of crystals are obtained by determining the temperature at which the crystals will neither rise nor sink in a suitable liquid. The density of the suspending liquid must be determined accurately at some temperature by either the pycnometer or sinker method and the temperature coefficient of density of the liquid must be known. Sufficient sensitivity is attained to detect differences in isotopic composition of salts such as lithium fluoride, potassium chloride, etc.

Direct Displacement Methods—If a solid is added to a vessel partially filled with liquid, the level of the liquid surface will be raised and the volume of liquid between the original and final levels will be equal to the volume of the solid. Flasks with graduated necks having scales on which the volume corresponding to the rise in the liquid surface can be read directly are used for determining the density of fine materials such as sand and cement.

Sometimes a flask with a single mark is used and the volumes required to fill it to the mark, (a) when initially empty and (b) when containing a known weight of solid, are measured by means of a burette.

In H. V. Regnault's volumometer the solid displaces air in a chamber connected to a manometer. By observing pressure changes on expanding or contracting the air by a definite amount, (a) when the chamber contains air only and (b) when it contains the solid also, the volume of the solid can be determined.

In the methods for the determination of the density of solids it is assumed that the solid is insoluble in the liquid in which it is immersed. Water is therefore unsuitable in the great majority of cases. Toluene, where it is otherwise satisfactory, is a good liquid to use since its density is quite accurately known, most inorganic compounds are insoluble in it, it has a relatively low vapour pressure and it readily wets most solids.

Density of Gases—The volume of a given mass of gas and consequently the density of the gas varies considerably with changes in either temperature or pressure. In order that results may be comparable it is customary to report the density of a gas under standard conditions of temperature and pressure. The standard temperature adopted is 0°C and the standard pressure is 760 mm of mercury. These conditions are referred to as "normal temperature and pressure" (abbreviated NTP).

If V is the measured volume of a given mass m of gas at a pressure P and a temperature $t^{\circ}\text{C}$, the volume at NTP can be calculated by use of the perfect gas laws (see KINETIC THEORY OF MATTER) and the density at NTP is

$$d_{\text{NTP}} = \frac{m}{V_{\text{NTP}}} = \frac{m}{V} \frac{760}{P} \frac{273+t}{273}$$

An accuracy of 2%–5% can be assumed for the perfect gas laws and therefore for densities calculated by their use. The perfect gas laws more nearly represent the real behaviour of a gas the higher the temperature and the lower the pressure.

Calculation of the Molecular Weight of a Gas—*The Method of Limiting Densities*—One form of the perfect gas law is

$$PV = \frac{m}{M} RT,$$

where P , V and m have the same significance as above, M is the molecular weight of the gas, R is a constant and T is the absolute temperature. Since $m/V = d_g$, the density of the gas under the experimental conditions, the molecular weight

$$M = \frac{d_g RT}{P} \quad (7)$$

At a given temperature d_g/P would be a constant for a given gas if the gas laws were strictly valid. Experimentally, this ratio is not constant but depends on the pressure. If measured values of d_g/P are plotted against P , a linear relationship is obtained. Extrapolation to zero pressure gives a limiting value of d_g/P which may be substituted in equation 7 to give the true molecular weight of the gas.

Methods of Determining the Density of Gases—*By Weighing a Globe Filled with the Gas*—This method is the counterpart of the pycnometer method for determining the density of liquids. The volume of the globe is determined from the weight of water required to fill it.

The globe is then weighed, first evacuated and second filled with gas, at a measured temperature and pressure.

FIG 9—MICROBALANCE

Because of the large volume occupied by a small mass of gas the mass of the globe must be evitably be large compared with that of the enclosed gas. Hence, small percentage errors in the weighings cause large percentage errors in the mass of the gas.

This coupled with the necessity for accurate control and measurement of both temperature and pressure, renders the accurate determination of the densities of gases by this method a matter calling for the utmost refinement of experimental procedure.

By Measuring the Volume of a Known Mass of Gas—This method is the reverse of the preceding one and consists in using one or more globes to determine the volume of the gas whose mass is determined separately. For example, one of the methods used by E. W. Morley in his determination of the density of hydrogen was to weigh the hydrogen absorbed in palladium and to measure the volume of the hydrogen in three globes having a total capacity of 42 l. E. P. Perman and J. H. Davies absorbed a measured volume of ammonia in concentrated sulphuric acid in order to obtain its mass.

By Means of the Microbalance—A very light quartz beam represented by AB in fig. 9 is delicately pivoted at its centre C. At one end of the beam is a small quartz sphere filled with air. The whole balance is enclosed in a vessel which can be filled with gas under a pressure measured by the manometer M.

If the balance is in equilibrium (*i.e.*, with the point D opposite the fixed point P) in one gas at a pressure p_1 and in a second gas at pressure p_2 , the temperature remaining constant, the density d_2 of the second gas at NTP is given by

$$d_2 = d_1 \frac{p_2}{p_1}$$

FIG 10—DIAGRAM OF VICTOR MEYER'S APPARATUS

where d_1 is the density of the first gas at NTP.

The microbalance affords an accurate means of comparing the densities of two gases and can be used with small quantities of gas. More robust instruments based on the same principle have been designed for the commercial determination of gas densities.

Determination of the Density of Vapours—*Dumas' Method*—The liquid is vaporised in a globe having a neck drawn down to a capillary. So long as any liquid remains in the globe, vapour may be seen issuing from the capillary, but this ceases abruptly when the supply of liquid is exhausted. At this instant the capillary is sealed. By weighing the globe the mass of the contained vapour may be determined and its volume may be obtained by weighing the globe both filled with air and filled with water.

The resulting density is that of the vapour at the temperature and pressure prevailing when the bulb was sealed.

To avoid the errors involved in weighing a large globe, H.

Schulze introduced an ingenious modification in which the vapour is liquefied in a small subsidiary bulb for weighing.

Joseph Gay-Lussac's Method—This consists in volatilizing a known mass of liquid over mercury and measuring the volume of vapour produced. By using a long vertical tube to contain the mercury the liquid can be volatilized under low pressure. A number of modifications of the method have been introduced from time to time, two recent ones being those of Sydney Young and of A. G. Egerton.

Victor Meyer's Method—A simple arrangement of apparatus for Victor Meyer's method of determining the density of a vapour is shown in fig. 10. The liquid in A is heated until air ceases to issue from the tube B. The calibrated tube C, filled with water, is placed over B and a small bulb containing a known weight of liquid is released into the inner bulb D. The temperature in A is high enough to ensure rapid volatilization of the liquid. The vapour displaces air which is collected and measured in C. The volume of this air reduced to N.T.P. is equal to that of the vapour reduced to N.T.P. since before displacement from D the air was at the temperature and pressure of the vapour.

Ed.*, vol. vi, p. 44 (1930).

(V. St., H. E. Wi.)

DENT, JOHN CHARLES (1841–1887), Canadian journalist and historian, was born at Kendal, England. He was educated in Canada, being called to the bar in 1865. After writing for the *English Daily Telegraph* and then for certain Boston newspapers, he joined the editorial staff of the *Toronto Globe* in 1870. Later he turned to history, producing *The Canadian Portrait Gallery* (biographical studies, 1870), *Canada since the Union of 1841* (1881), *Rev. Henry Scadding* (1884) and *The Upper Canada Rebellion* (1885).

DENTAL RUBBER, a form of vulcanite, coloured pink to simulate the human gums, and used extensively, strengthened with metal, to form the setting of artificial teeth, for which it is admirably suited. It is manufactured from over-vulcanized rubber, i.e., pure rubber which is rolled with about 40% of sulphur, and in which a considerable amount of vermilion or other suitable pigment is incorporated. It takes a high polish, is tasteless and odourless, and is comfortable in wear.

DENTATUS, MANIUS CURIUS, Roman general, conqueror of the Samnites and Pyrrhus, king of Epirus, was born of humble parents, and was possibly of Sabine origin. In 290 B.C., when consul with P. Cornelius Rufinus, he gained a decisive victory over the Samnites, which put an end to a war that had lasted 50 years. He also reduced the revolted Sabines to submission, a large portion of their territory was distributed among the Roman citizens, and the most important towns received the citizenship without the right of voting for magistrates (*avitas sine suffragio*). With the proceeds of the spoils Dentatus cut a canal to carry off the waters of Lake Velinus so as to drain the valley of Reate. In 275, after Pyrrhus had returned from Sicily to Italy, Dentatus (again consul) took the field against him and defeated him completely near Beneventum. Dentatus was consul for the third time in 274, when he finally crushed the Lucanians and Samnites. As censor in 272 he began to build an aqueduct to carry the waters of the Anio into the city, but died (270) before its completion. Dentatus was looked upon as a model of old Roman simplicity and frugality.

Livy, epitome, iii, 14, Polybius, ii, 19, Eutropius, i, 9, 14, Florus, i, 18, Val. Max. iv, 3, 5, vi, 3, 4, Cleero, *De senectute*, 16, Juvenal, xi, 78, Plutarch, *Pyrrhus*, 25.

DENT DU MIDI, a conspicuous peak of the Swiss Alps 6 mi. S.W. of St. Maurice in the lower valley of the Rhône, with an altitude of 10,666 ft. See *ALPS*.

DENTIL, in architecture, a small, rectangular block, used in a row as a decoration for the bed moulding of a cornice. It is undoubtedly a decorative interpretation in stone of projecting beam ends in earlier wooden construction, and many of the famous rock cut tombs of Lycia, in Asia Minor, which represent wooden

structures, show similar forms. Moreover, the tomb of Darius at Nakshi Rustrān (c. 485 B.C.), which represents the entire front of a Persian palace, plainly shows the beam ends appearing as a dentil band. In ordinary classic usage the dentil decorates the cornices of the Ionic and Corinthian orders (see *ORDER*). The Attic custom, followed generally by the Romans and the Renaissance architects, kept the dentil relatively small, and spaced the dentils with an interspace of about half the width of the block itself. Occasionally, as in the Pantheon at Rome (c. 120), an unbroken band, known as a dentil band, replaces the separate dentils. In the Hellenistic temples of Asia Minor, such as the great temple of Athena Polias at Priene (c. 350 B.C.), a special type of heavy Ionic entablature is used, in which the dentils are much enlarged, more widely spaced, and resemble brackets. The Byzantine dentil was a specific type of band ornament, possibly with little relation to the classic dentil, and was used especially as a border for panels. It consists of an alternation of projecting blocks with splayed faces between, usually arranged in a double band, with the blocks on one side of the centre in every case opposite the splayed faces on the other. It is so found bordering the marble panels of S. Sophia at Constantinople (6th century), and became a favourite ornament in Venice, where it was used as a panel mould, as a horizontal band and around arches.

DENTISTRY is the healing art concerned with the health of the mouth, especially the teeth. It is also the profession practising this art. (For anatomy see *TEETH*.)

Of the many conditions of the mouth treated by the dentist, the three that occupied most of the profession's attention throughout its history are dental caries (or decay of the teeth) and its consequences, disease of the supporting and investing structures of the teeth (periodontitis, commonly called pyorrhoëa) and irregularities (malpositions) of the teeth.

Caries, the principal problem of dentistry, is produced by acid dissolution of the calcium salts which constitute most of the tooth. W. D. Miller showed, 1880–90, that micro-organisms participate in the formation of the acid. Destruction begins in spots on the surface where the micro-organisms are undisturbed, and the action is believed to occur within a few minutes after carbohydrate foods, especially sugars, are taken into the mouth. In saliva, these are transformed, through products of the micro-organisms, into lactic acid or other organic acids. Caries, from its inception, is a liability of the tooth, because it may lead, successively, to loss of part or all of the crown, involvement of the dental pulp, infection of the structures about the end of the root, loss of the entire tooth, or impairment of health by dissemination of the infectious influence through the circulation. Dentistry may prevent or remedy, by treatment, all of these conditions. Preventive measures, although logically the first step in combating caries, were largely neglected until the early years of the 20th century. The historical order in which measures were taken against the destruction of caries was, probably, first of all, use of medicinal applications to the teeth when toothache was present, second, removal of affected teeth after the inefficacy of medicinal remedies became generally apparent, and the substitution of artificial teeth, third, removal of the decay and restoration artificially of the lost part—the means most largely employed after the early 19th century, and, finally, steps to prevent the disease or arrest it at an early stage.

Operative Dentistry—This phase of dentistry aims to conserve the tooth and restore it, when carious, before the crown is lost. The first step in filling is preparation of the cavity. Before 1800, the preparation was limited to gaining access to the cavity and to removing the decay. From 1800 to 1860, attention was given to modifying the cavity so that the filling would not be displaced. From 1891 to 1900, largely through G. V. Black, cavity preparation was systematized and modification of the cavity outline, called extension for prevention, was introduced to obviate recurrence of decay. After 1907, slight modifications were made for the cast gold inlay.

The earliest fillings known, placed during the middle ages, were resins, waxes, or gums. In the late middle ages, leaf metals—particularly lead and gold—were employed. Gold was used in

early as 1450. In 1855, Robert Arthur introduced the technique of cohesive gold foil in which the foil was heated to render the surface pure, and cold welded in the cavity under pressure of hand instruments. When the cohesive property was understood and a control of saliva was found in the rubber dam (invented by S C Barnum, in 1864), cohesive gold became, by 1875, the preferred filling, since by it alone the form of the tooth could be restored. Cohesive gold serves perfectly as a preserver of the tooth, but because of the tediousness, for patient and dentist, of placing it, it was partly superseded, after about 1910, by silver amalgam and the cast gold inlay. Amalgam was introduced by 1828. It consists of silver or some of its alloys combined with mercury to make a plastic mass that can be adapted to the cavity and will harden within a reasonable time. Because of leaky margins of fillings and the unfounded belief that the contained mercury could affect the patient's health, amalgams were not altogether in good repute until after 1895. Then the experimental work of G V Black placed them upon a scientific basis. In posterior teeth, amalgams are satisfactory fillings and are the most frequently placed.

In 1907, William H Taggart introduced a practical method of making cast gold inlays. An impression of the cavity is taken in wax, after this has been invested with an artificial stone material to form a mould, and the wax burned out, molten gold is forced into the mould. The resulting casting is cemented into the cavity. Methods of compensating for the shrinkage of gold upon solidifying made the gold inlay a satisfactorily fitting restoration, and the advantage of restoring the anatomical contours of the tooth often gives it preference. The gold inlay largely restricted the use of gold foil. An ideal filling material unites durability with appropriate colour. The durable materials, mentioned above, are all lacking in tooth colour, the materials with aesthetic properties lack durability. Baked porcelain inlays (c 1889) and silicious cement (1904), improperly called synthetic porcelain, have been extensively employed. About 1938, inlays of synthetic resins began to be tried. These inlays have high aesthetic properties but lack hardness comparable with tooth structure. Other materials—oxychloride of zinc cement (1860), zinc phosphate cement (1878) and gutta percha (1848) have been used for temporary or special purposes.

When caries penetrates to the pulp, toothache usually occurs, and the actual or potential diseased condition of the pulp must be considered in the treatment. In children's teeth, where the root end is not completed, sometimes capping of the pulp with filling material has been resorted to. In other cases, ordinarily, the pulp is removed if the tooth is retained. Until about 1880, extirpation of the pulp was regarded as out of harmony with current pathological principles, nevertheless, after 1836 with the introduction of arsenic by J R Spooner to destroy the pulp, the practice of pulp removal increased greatly because the operation became almost painless. Recognition, after 1880, that micro-organisms are responsible for pulp disease was thought justification for pulp extirpation on theoretical grounds, and for the next 30 years, drastic germicidal methods were employed to sterilize root canals. About 1910, it began to be realized that these methods often lead to injury of the structures about the root end, with the result that this region becomes vulnerable to further infection, which may be extended to other parts of the body. An address by William Hunter, a British medical man, criticizing dental practices, especially in crown and bridgework, and disregard for dangerous septic conditions prevailing in the mouths of patients, greatly influenced dentists and physicians to consider general health in relation to conditions of the teeth. The X-ray played an important part in the discovery of these conditions. As a result, some dentists advocated extraction of all teeth with involved pulps. Others resorted to more conservative measures of pulp removal, using milder antiseptics, and in general, substituting an aseptic technique for more drastic antiseptic measures. In place of arsenic, cocaine (1890) and procaine (1906) were employed for an anesthetizing the pulp for removal. When the pulp is removed the root canal should be completely filled to the apex of the

tooth and for this purpose, gutta percha was generally employed after about 1870.

Prosthetics is the substitution of artificial replacements for lost natural parts. Strictly speaking, a filling is a prosthesis, but conventionally, prosthetic dentistry is confined to the restoration of whole crowns and lost teeth.

When a tooth crown cannot be saved, an artificial crown may be adjusted to the root. Crowns are of several sorts. The earliest, described in 1728, was an artificial or natural crown mounted on the root by a post inserted into the root canal. This post crown was developed in numerous forms by U S dentists. The Richmond crown, introduced in 1880, was one of the best known. W N Morrison, in 1869, devised the gold shell crown consisting of a band of gold plate adapted to the circumference of the root, with a swaged chewing surface soldered to the band. It was extensively used on posterior teeth, especially to support bridgework. Often instead, the cast gold crown, cast like an inlay, is preferred. For aesthetic purposes, on the front teeth, the porcelain jacket crown, devised by C H Land, about 1890, is available. It consists of a porcelain shell baked onto a platinum matrix fitted to the natural crown, from which the enamel has been removed.

Lost teeth are supplied either by bridgework or by dentures. In bridgework, the load is borne by teeth on either side of the gap, in a denture the load is on the gum and underlying structures. Bridgework is probably the oldest form of prosthesis, being constructed by Etruscan goldworkers, perhaps as early as 1000 B C. Bridges are either removable by the patient or fixed. From the 18th century, bridges were supported by posts as were single crowns. Ligated teeth, originating in antiquity, may be regarded as the earliest removable bridges. Many ingenious and patented devices for retaining removable bridges were introduced during the late 19th century. With the advent of the gold inlay, great improvements in the treatment of the supporting teeth were possible. So-called fixed movable bridges were constructed, in which one end of the bridge was attached to a gold crown or inlay while the other was supported by a spur merely resting on an inlay in the other supporting tooth. This device allows slight physiologic movements of the supporting teeth during mastication.

Dentures are either partial or complete, the former being used when some teeth are present in the jaw, and the latter when all teeth are missing. Both types have been made since the late 17th century. Beginning about 1800, partial dentures could be retained by metal clasps partly encircling the crowns of teeth present. Complete dentures, until about 1850, were usually held in place by spiral springs, one on either side, extending from the lower to the upper denture. Beginning about 1800, in the United States, dentures were designed without special retention devices, to be held by close adaptation to the supporting parts and by the extension of the baseplate of the upper denture over a large part of the hard palate. Proper fit of dentures was greatly facilitated by the adoption of impressions and models of the mouth, at the close of the 18th century. Beeswax was usually employed for taking impressions, and plaster of Paris for making the model, about 1844, plaster began to be used for both purposes and about 1857 impression compound was introduced, a combination of various ingredients including a resinous material capable of softening by heat and an inert solid such as soapstone. Plaster and compound are the materials in general use, though some elastic and other materials are also employed. Better methods of making impressions, beginning about 1910, greatly improved complete dentures. In the 18th century, bone, ivory, hippopotamus tusk and gold were the chief baseplate materials, and these were difficult to conform to the supporting tissues. About 1790, use of porcelain began, and about 1860, vulcanite (vulcanized rubber), first used in dentistry in the 1840s, came into general favour. These materials could be adapted to the model, as could also swaged bases of gold or platinum. Until 1935, vulcanite remained the most generally satisfactory baseplate material, but at that time, various kinds of synthetic resins were introduced, and some of these were

or supported public health dentistry. The nature and extent of the service is extremely variable. Educational work and dental inspections are frequent in public schools, prophylaxis is sometimes included, fillings and extractions are less commonly provided. Buenos Aires, Argentina, established (1934) municipal clinics furnishing all services, including orthodontics.

Professional Development.—Dentistry as a vocation existed in ancient Roman times, for Martial mentioned one Caccilius who "re-moves or restores a bad tooth." Dentistry received some recognition as a profession in France during the 18th century, but institutions characteristic of a profession did not appear until 1840. Previously, dental education was secured largely through apprenticeship to dentists and technical craftsmen. In 1839-40, in the United States, the first regular dental school (the Baltimore College of Dental Surgery), the first dental journal (*The American Journal of Dental Science*), and the first national dental organization (the American Society of Dental Surgeons) were established. Similar developments took place a few years later in England, Germany and France. Considerably later, effective measures for licensing dentists in the government agencies were instituted. Technical literature on dentistry began with Pierre Fauchard's *Chirurgie Dentaire* in 1728. It was followed by a continuous issue of professional books in France, England, Germany and other countries. The earliest notable work in the United States was Chapin A. Harris' *Dental Art* (1819). In England the outstanding work was John Tomes' *Dental Philosophy and Surgery* (1848). Periodical publication increased enormously throughout the world during the 19th century. Dental education in the United States has been carried on independently of medicine and surgery. From a few months, the dental course was gradually lengthened until, by 1940, it consisted of two years' pre-dental study in college and four years in dental school. The course covers basic sciences, medical sciences and technical training, as well as clinical practice. In England, the first licenses were issued by the Royal College of Surgeons, 1859, and the dental professions remained largely under medical control. Two views of dentistry competed for supremacy throughout its history, especially in Europe—that of the stomatologists, who consider dentistry as a specialty of medical practice, and the odontologists, who hold that dentistry is a distinct practice. Dentistry is completely organized in professional societies in most countries of the world. In the United States the American Dental Association is the national organization. In England, the British Dental Association is the official society.

Specialization. In the practice of dentistry developed largely in the 19th century. The practice of orthodontics has been largely carried on by specialists. Other branches sometimes practiced exclusively are exodontia (extraction), prosthodontia (denture work), ceramies (porcelain work), pedodontia (children's dentistry), periodontia (care of pyorrhea), radiodontia (X ray work) and oral surgery.

The technical and scientific progress of dentistry closely paralleled the progress of science and technology generally throughout the 19th and 20th centuries. The inventions and discoveries in physical, biological and medical sciences particularly pertaining to dentistry have, in the main, been the work of dentists or persons closely associated with that profession.

DENTON, urban district, Mossley parliamentary division, Lancashire, Eng., 4½ mi. N.E. from Stockport, on the London Midland Region railway route. Pop. (1938), 21,700. Area, 4.1 sq. mi. In the township are reservoirs for Manchester's water supply. The leading industry is the manufacture of felt hats. Coal occurs in the district.

DENTON, a city of Texas, U.S.A., 35 mi. N.W. of Dallas and N.E. of Fort Worth, the county seat of Denton county. It is on federal highways 77 and 377, and is served by the Missouri-Kansas-Texas and the Texas and Pacific railways. Pop. (1950) 21,345. Wheat, oats, corn, cotton, peanuts, grain sorghums, fruit and truck are raised in this region. It is a livestock, dairy and poultry centre.

Industries include flour mills, a brick plant, a food products plant, a cheese plant, a garment factory and bottling plants. It is the seat of the North Texas State college and the Texas State College for Women. Denton was settled in 1857 and incorporated in 1866.

D'ENTRECASTEAUX ISLANDS, a group of islands in the Pacific ocean 15 to 30 mi. N.E. of New Guinea. They com-

prise three large islands, Ferguson, Goodenough and Normanby and a number of islets separated by narrow channels with a total area of 12,000 sq. mi.

There are traces of extinct volcanoes, and gold has been discovered in certain parts. They were discovered by Bruni D'Entrecasteaux in 1792 and are now part of the dependency of New Guinea (q.v.).

DENVER, capital of Colorado, U.S., on the South Platte river, in the centre of "the west." Population in 1950 was 412,856, it was 322,412 in 1940, 287,861 in 1930 and 256,491 in 1920 by the federal census. It is on federal highways 40 and 85, is served by the Burlington, the Rock Island, the Santa Fe, the Union Pacific, the Denver and Rio Grande Western and the Colorado and Southern railways, and by Braniff, Continental, United and Western air lines. The Moffat tunnel of the Denver and Rio Grande Western railway through James peak in the continental divide built by the city of Denver in co-operation with parts of several counties in northwestern Colorado and opened in 1928, eliminated 27 mi. of 4% grade and made possible shortening the distance to Salt Lake City and other points west by 175 mi.

The altitude of Denver, at the state capital, is exactly one mile above the sea. Its area, co-extensive with that of the county of Denver, is 66 sq. mi. It lies at the edge of the great plains, in the river valley running north and south, 12 mi. E. of the main range of the Rocky mountains, which stretches in a snow-capped background visible for 150 mi. from Pikes peak on the south to Longs peak on the north. The climate, with a low degree of humidity throughout the year and a high percentage of sunshine, is favourable alike to health, industry and recreation. The city is well planned, with broad streets and a system of boulevards and parkways. Because of severe restrictions against wooden structures adopted in the early days, most of the residences, as well as the business and public buildings, are of brick, stone, tile or cement.

All railroads enter the Union station, a fine and commodious structure built in 1914 at a cost of more than \$3,000,000. There are 35 parks and 17 supervised playgrounds within the city limits,

THE COLORADO STATE CAPITOL, BUILT 1887-95 IN THE CENTRE OF DENVER SHOWING THE DOME WHICH IS OVERLAIN WITH NATIVE GOLD

comprising 1,563 ac., and the city owns a chain of 30 mountain parks (in one of which is the grave of "Buffalo Bill"), aggregating 25,000 ac. in area, and connected with one another and with the city by 100 mi. of boulevard.

In the centre of the city is a stretch of half a mile (40 ac.) devoted to public buildings set in landscaped grounds. The massive state capitol of native granite (built in 1887-95, at a cost of \$3,000,000), topped by a dome overlaid with gold from Colorado mines, stands on a terraced hill, flanked by the state office building, state capitol annex and the state historical museum, which

contains exhibits of prehistoric and Indian life and of pioneer days.

Immediately west of the capitol grounds is the beautiful civic centre (built through the initiative of Robert W. Speer, who was mayor 1904-12 and 1916-18), including the Public library, a Greek theatre and a \$5,000,000 city and county building, and beyond this group is the US mint. In City park, a tract of 408 ac set aside at an early date, is the Denver museum of natural history. There is a municipal auditorium, seating 12,000 where the Democratic national convention which nominated William J. Bryan met in 1908.

The water supply taken from the river at a point 23 mi above (i.e. southwest of) the city, is supplemented by a system of reservoirs in the mountains and in, or adjacent to, the city, which have a capacity of 74,000,000 gal, enough to supply the city for three years without replenishing. The eight-foot pioneer bore of the Moffat tunnel, paralleling the main bore, brings water from the western slope of the continental divide supplementing the South Platte watershed supply. The assessed valuation of property for 1949 was \$577,255,900.

Education—The public school system includes 63 elementary, 11 junior high, 5 senior high and several special schools, including one for deaf children, one for crippled children and the Emily Griffith Opportunity school. The Catholic schools include 21 parish elementary schools and 5 parish high schools.

Among the institutions for higher education are the University of Denver (Methodist), chartered in 1864 as Colorado seminary, Colorado Woman's college (1888), Regis college (1887), the Iliff School of Theology (Methodist Episcopal), the medical school of the University of Colorado, Loretto Heights college, and the Westminster Law school.

Tourist Amenities and Climate—As a recreation centre Denver has so many attractions that providing for tourists is one of the leading industries. Motorbuses for sight seeing run in every direction. The tourist bureau lists 60 excursions to points of beauty and interest which can be made in a day or less each.

Sports include glacier climbing, skiing, bathing in pools of hot mineral water, trout fishing and yachting on Grand lake (8389 ft above sea level), where an annual regatta is held in August. A mountain highway to the top of Mt. Evans, 14,260 ft, is the highest automobile road in North America. It is estimated that tourists spend more than \$64,000,000 annually in the city.

The climatic advantages of Denver led to the establishment there of many hospitals and sanatoria of national scope, philanthropic and commercial, especially for the treatment of tuberculosis. There are connected with the University of Colorado Medical centre the Denver General Hospital, Tufts Memorial General Hospital, U.S. Army and the Veterans Administration hospital, making the city one of the important medical centres of the country.

Commerce and Industry—Denver is the administrative centre of the commercial and industrial metropolis of the west. There is no large city that is so much in its own right. Federal departments of the federal government are represented by approximately 225 bureaus and commissions—more than in any other city outside Washington. The mint was established in 1860, and the secret of the treaty purchased the private mint of Clark Gurnee and company which coined gold pieces containing 1% more gold than US coins of corresponding denominations. It is one of the three federal coinage mints, making silver dollars and small

The Denver stockyards is the largest cattle market in the west and it is the largest sheep market in the world. At the National Western stock show (held annually in January since 1907) pedigreed breeding cattle are bought and sold in carload lots, feeder stock by the trainload.

Distance from the manufacturing centres of the east forced Denver in its early days to develop industries to supply the needs of the mining and frontier population for wagons and harness mining machinery, meat, flour and other necessities. On this foundation, utilizing the raw materials—mineral, animal and vegetable—at its doors, developing its specialties, but also diversifying its products, and gradually extending its markets the manufactures of the city grew. A favourable factor is the abundant supply of coal and fuel oil from mines and refineries within a very short haul. In 1928 natural gas was piped in from the Amarillo district of Texas.

The leading industry, in point of value of product, is slaughtering and meat packing. Receipts at the stockyards in 1949 included 961,689 cattle and calves, 432,531 hogs and 1,857,935 sheep.

Other manufactures of importance are mining machinery, which is marketed all over the world, sugar mill equipment which goes as far as Hawaii and the Philippines, and luggage that is sold in every state of the union. A rubber manufacturer sells about 2,000 products in the domestic market as well as in all foreign countries.

The manufacture of candy is favoured by the dry atmosphere. In spite of its distance from ports, Denver has many businesses engaged in world trade. Export business was in 1950 estimated at \$30,000,000.

History—John Simpson Smith, trapper and trader, with his Sioux wife Wapoola, settled on the site of Denver in the autumn of 1857. The following summer, after traces of gold were found in the sands of Cherry creek by W. Green Russell of Georgian settlements grew up on opposite sides of the creek, near its confluence with the South Platte river (at 14th street in the present city plan). Auraria on the west bank, and on the east bank St. Charles, which was almost immediately renamed Denver, after the territorial governor, Gen. James W. Denver. The two settlements, with a population of about 1,000, were consolidated in 1860 and in 1861 received a charter from the first territorial legislature of Colorado.

In 1867 Denver was made the capital of the territory, and in 1881, five years after Colorado became a state, the choice was confirmed by popular vote.

On Oct. 29, 1858, in a blinding snowstorm, two men drove in with a wagon train and opened the first "store." A second was opened on Christmas day, and a jewellery store a few days later. At the opening of 1859 lumber sold for \$100 per 1,000 ft., flour for \$20 to \$40 per 100 lb., and sugar, coffee and tobacco for almost their weight in gold dust, the currency of the region for some years.

The first hotel (the Eldorado) was opened in a large log house on Feb. 1, 1859. On April 23 the first number of the *Rocky Mountain News* was issued. On May 9 arrived the first coach of the Leavenworth and Pike's Peak Express company, which carried letters at 25 cents an ounce. News of Lincoln's election was brought from St. Joseph, Mo., nearly 700 mi., by the Pony Express in 69 hours. Letter postage by Pony Express was \$5 per letter. Telegraph connection with the east (\$9 for ten words) was established in 1863.

A private mint and a bank were opened in 1860. In 1863 there was a severe fire, and in 1864 a terrible flood came down Cherry creek and washed away many buildings. The first schoolteacher, dressed in a black broadcloth frock coat and a silk hat, drove into town late in the summer of 1859, behind a team of oxen which he apostrophized with Greek and Latin oaths that won him infinite respect from the local masters of profanity. In October he opened a school in a log cabin, after \$250 had been subscribed for its "endowment." In 1864 Colorado seminary was established, largely through the efforts of Gov. John Evans, who had been one of the founders of Northwestern university at Evanston, Ill. When the Union Pacific passed through 106 mi. to the north of Denver,

a local company was organized to connect the city with it by a line to Cheyenne, Wyo., and on June 23, 1870, the first passenger train arrived. On Aug. 13 the Kansas Pacific was completed to Denver, and other transportation facilities soon followed.

By 1870 there were 1,500 buildings in the city, and the population was 4,759. In the next 20 years it grew to 106,713. All the facilities of a modern city were introduced in the '70s, and the '80s were a period of great activity in real estate. Since 1890 growth has been steady though less spectacular. In the early days, Denver had its problems with "squatters" and "land jumpers."

There were the social conditions usually found in new mining communities, including crimes of violence and some exercise of extrajudicial methods of administering justice. At the Palace gambling hall and variety theatre, celebrated the world over, fortunes were won and lost in a night. A flood in 1878 and the famous strike in Denver and Leadville in 1879-80 were temporary checks to prosperity.

In 1880 there was a memorable election not, under the guise of an anti-Chinese demonstration. A serious streetcar strike in 1900 involved the loss of seven lives, the importation of armed strikebreakers, the intervention of federal troops and military rule for a month. Denver was the first city to undertake to finance its charitable agencies by a joint "community chest." Its juvenile court, under Judge Ben B. Lindsey (1869-1943), who served from 1901 to 1927, was a pioneer in its field. In 1902 a city and county of Denver was created, with power to frame its own charter, and the charter was adopted in 1904, but dual sets of officers served until 1912.

A commission form of government was in force in Denver for four years from 1912, but in 1916 the mayor and council form was resumed.

DENVER AND RIO GRANDE WESTERN RAILROAD, incorporated in 1870, was conceived as a narrow gauge (3'6") trunk line from Denver, Colo., to Mexico City, Mex. The route was projected along the Rio Grande del Norte, hence the first name, Denver and Rio Grande railway. Course of the railroad was turned westward through the Royal Gorge to tap the Leadville mining district, by 1883 the narrow gauge line was completed between Denver and Ogden, Utah, with branches reaching into the mountains wherever mining development demanded transportation. The Royal Gorge route, a through standard gauge (4'8 1/2") line, Denver to Ogden, via Tennessee Pass (10,240 ft.), 78 mi., supplanted the narrow gauge line in 1890, as the Rio Grande became an integral part of several transcontinental systems. Remaining narrow gauge are 686 mi. of track, all in southwest Colorado, longest in the U.S., these lines are the model for all similar operations in the world. The Moffat Tunnel route, shortening Rio Grande's Denver-Salt Lake City distance to 570 mi., in 1934 strengthened the road's position as a transcontinental route by utilizing the 6.2 mi. bore through the Continental Divide 50 mi. from Denver.

The Rio Grande operates 2,566 mi. in Colorado, Utah and New Mexico.

DEODAND, in English law, any personal chattel which, having moved *ad mortem* or been the immediate cause of the death of any reasonable creature, was forfeited to the king for pious uses. It was originally designed as an expiation for the souls of those suddenly snatched away by violent death, and was abolished by 9/10 Vict. C. 62. This imputation of homicidal guilt to inanimate objects or the lower animals is of great antiquity and led in the middle ages to the judicial trial of animals or things for man slaughter.

In England, subsequent to the Reformation, deodands were distributed as alms by the king's high almoner, though more recently they were regarded as mere forfeitures.

If a horse or other animal in motion killed a person, whether infant or adult, or if a cart ran over him or a tree fell upon him, it was forfeited as a deodand and its value was appraised by the jury. It was at one time held that if death were caused by falling from a cart or a horse at rest, the law made the chattel a deodand only if the person killed were an adult, not if he were below years

of discretion, but in later times this distinction was abolished. Blackstone says "where a thing not in motion is the occasion of a man's death, that part only which is the immediate cause is forfeited, as if a man be climbing up the wheel of a cart, and is killed by falling from it, the wheel alone is deodand." Whereas, if the cart were in motion, not only the wheel but all that moves along with it (as the cart and loading) are forfeited. On the other hand, if a man riding on the shafts of a wagon fall to the ground and break his neck, the horses and wagon only are forfeited and not the loading, because it in no way contributed to his death. Where a man is killed by a vessel at rest, in fresh water, the cargo is not deodand, where the vessel is under sail, hull and cargo are both deodand. But accidents on the high seas, or on an arm of the sea, did not cause forfeiture "because manners are continually exposed to so many perils that the law imputes misfortunes happening there rather to them than to the ship." The finding of a jury was necessary to constitute a deodand, and the death must take place within a year and a day of the accident. The investigation of the value of the instrument by which death was caused at one time occupied an important place among the provisions of English criminal law. More recently these forfeitures became extremely unpopular, and jurors, with the connivance of judges, found deodands of trifling value, so as to defeat what was regarded as an inequitable claim.

DEODAR, The deodar or "god tree" (*Cedrus Deodara*) is a species of coniferous evergreen tree closely allied to the cedar, the timber obtained therefrom being of considerable value. It forms extensive forests in the Himalayas at elevations of from 7,000 ft. and is also found in Afghanistan and north Baluchistan. The wood is durable and light red in colour and is used particularly for cabinetwork as it can be highly polished. See also CEDAR.

DEODORIZER, a disinfectant which acts by oxidizing or otherwise changing the chemical constitution of volatile substances disseminated in the air. It also prevents noxious exhalations from organic substances, and in virtue of its properties is an effective disinfectant in certain diseases. See also DISINFECTANTS.

DEOGARH (known in Bengal as Baidyanath, also called Baidyanath Deogarh), a town in the Santal Parganas district of Bihar, India. Pop. (1941) 29,792. It has a famous temple dedicated to Baidyanath or Siva, the resort of numerous pilgrims. It also enjoys a reputation as a health resort among Bengalis, many of whom have country houses here.

DEOLS, a suburb of the French town of Châteauroux, in the department of Indre. Pop. (1946) 3,394. Deols lies to the north of Châteauroux, from which it is separated by the Indre. It preserves a fine Romanesque tower and other remains of the church of a famous Benedictine abbey, the most important in Berry, founded in 917 by Ebbes the Noble, lord of Deols. A gateway flanked by towers survives from the old ramparts of the town. The parish church of St. Stephen (15th and 16th centuries) has a Romanesque façade and a crypt containing the ancient Christian tomb of St. Lude and his father St. Leodead, who according to tradition were lords of the town in the 4th century. The pilgrimage to the tomb of St. Lude gave importance to Deols, which under the name of *Vicus Dolenis* was in existence in the Roman period. In 468 the Visigoths defeated the Gauls there the victory carrying with it the supremacy over the district of Berry. In the middle ages the head of the family of Deols enjoyed the title of prince and held sway over nearly all Lower Berry, of which the town itself was the capital. In the 10th century Raoul of Deols gave his castle to the monks of the abbey and transferred his residence to Châteauroux. The abbey church was burnt by the Protestants during the religious wars and in 1622 the abbey was suppressed by the agency of Henry II, prince of Condé and of Deols.

DEONTOLOGY is the title of a book by Jeremy Bentham (q.v.), who introduced the term to denote a utilitarian system of ethics. The name has since then come to be applied to a system of ethics in which prominence is given to ideas of *duty* rather than to those of *right* or *goodness*.

DEPARTMENT, a division or part of a system—one of the branches of the administration in a state or municipality. In Great Britain it is commonly applied to the subordinate divisions of the chief executive offices of state such as the savings bank or other department of the post office, the mines department of the board of trade, etc., in the United States these subordinate divisions are known as "bureaus," while "department" is used for the chief branches of the executive.

In France the word is also used for a territorial division corresponding loosely to an English county. Previous to the French Revolution the local unit in France was the military *gouvernement*, roughly corresponding to the old provinces, such as Franche Comte, Provence, Bourgogne, Bretagne, etc., but this division being too closely bound up with the administrative mismanagement of the old régime, at the suggestion of Mirabeau, the "provinces" were divided into departments, as nearly as possible equal to a certain average of size and population, and deriving their names principally from rivers, mountains or other prominent geographical features. In 1866 three new departments were created out of the newly annexed territory of Savoy and Nice. The three departments of Bas Rhin, Haut Rhin and Moselle which were lost after the Franco German War in 1871, were restored in 1919. Each department is provided over by an officer called a prefect (*général*) and is subdivided into *arrondissements* each in charge of a subprefect. *Arrondissements* are again subdivided into *cantons* and these into *communes*, somewhat equivalent to the English parish. (See *FRANCE: Government and Administration*.)

DEPARTMENT STORE, the name given in the United States to a retail establishment which sells a wide variety of goods including a general line of apparel, home furnishings and house wares and piece goods. Merchandise lines are normally arranged in separate sections or departments with the accounting on a departmentalized basis. Selling departments and non-selling ones such as advertising, delivery, credit and personnel are integrated under a single management. To distinguish the department store as an institution from the general merchandise store and the dry goods store, which are often organized on a departmental basis and render similar services, the bureau of the census in 1948 established as the size basis for this type of store the "normal employment" of 25 or more persons. In 1939 the bureau had used annual sales of \$100,000 or more as the basis.

Department stores are primarily "shopping" and "service" in institutions, i.e., they afford customers the opportunity of comparing quality, style and price before purchase and provide a wide variety of services such as credit delivery, accepting returns of merchandise, personal shopping assistance and many others. Because shopping often is done in more than one store, department stores generally thrive best in groups and are usually located in central or secondary shopping districts where they cater primarily to women.

Department stores are organized as independent unit stores or members of ownership groups or as units of chain store systems. The term ownership group refers mainly to former independent stores which have been brought under common ownership but have not been subjected to so much central control as is typical of chain store operations.

A important characteristic of many department stores is the "closed department" type. Under this arrangement the store agrees to permit no outside organization or person to operate a private selling department. The best example is the monthly rental charge of 1 to 2 per cent of the sales. Department stores commonly leased are millinery, tailors, fur shoes, candy and optical goods.

Following World War II, numerous department stores opened branches in suburban areas usually adjacent to the main, or "parent," store. This development took place because of the pronounced shift in population from large cities to suburban areas, changes in the shopping habits of women, increased use of the automobile, traffic congestion in central business districts and lack of economical and convenient parking lots in downtown areas.

Sales of department stores increased in about the same ratio as total retail sales after 1939, the first year for which comprehensive data became available. The department store share of

total retail sales was 9% in 1939, 10.1% in 1935, 9.5% in 1939 and 8.2% in 1948. Operating expenses in department stores are high, approximating 32% in 1950 for example. This figure exceeds those of the chief competitors of such stores and is mainly the result of the wide scope and variety of services offered customers. Significant differences exist, of course, in the operating expenses of various selling departments.

Department stores attempted to meet the competition of non-service chain stores, supermarkets and neighborhood stores through extensive modernization programs, adoption of self service arrangements in some departments, improved personnel training programs and liberal customer services. The latter while contributing to high expenses became a major factor in enabling the department store to maintain its strong competitive position. (D J D)

DE PERE, a city of Brown county, Wis., 109 mi. N. of Milwaukee, on the Fox river, 6 mi. from its mouth. It is served by the Chicago and North Western and the Chicago, Milwaukee St. Paul and Pacific railways and by lake and river steamers. The population was 8,146 in 1950, 6,373 in 1940.

De Pere is a shipping and transfer point, has grain elevators, foundries and machine shops, manufactures glassine hammocks, paper, farm implements and is the seat of St. Norbert college (Roman Catholic) established in 1902. The state reformatory is just north of the city. In 1634-35 Jean Nicolet found there at the first rapids of the Fox river, a polyglot village of several thousand Indians and there in 1669 Father Allouez established the mission of St. Francis Xavier, the second in the territory that is now Wisconsin. The French called the place *Rapides des Pères*, Nicolas Perrot, the first French commandant in the northwest, made it his headquarters, and there Father Miquette wrote the account of his journey to the Mississippi. A few miles south of the city lived for many years Eleazer Williams (c. 1787-1857), who claimed to be the "lost dauphin" Louis XVII of France, and was an authority on Indians, especially the Iroquois. De Pere was incorporated as a village in 1857 and as a city in 1883.

The first dam on the Fox river, connecting the Great Lakes to the upper Fox river valley, is located in De Pere.

DEPEW, CHAUNCEY MITCHELL (1834-1928)

US senator and politician, was born in Peekskill, N.Y., on April 23, 1834, of a Huguenot family (originally Du Puy or De Puy). He graduated from Yale in 1856, entered politics as a Republican—his father had been a Democrat—was admitted to the bar in 1858, was a member of the New York assembly (1861-62) and was secretary of state of New York (1864-65). Through his friendship with Cornelius and William H. Vanderbilt he became in 1866 attorney for the New York and Harlem railway in 1869 was appointed attorney of the newly consolidated New York Central and Hudson River railway, of which he soon became a director and in 1872 was made general counsel or the Erie Vanderbilt system of railways. He became second vice-president of the New York Central and Hudson River railway in 1869 president (1885-88) and then in 1895 of the board of directors of the Vanderbilt system. In 1870 he joined the Liberal Republican movement and was nominated but defeated for the office of lieutenant governor of New York. In 1895 he was elected US senator from New York state and in 1904 was re-elected to the term ending in 1912. His orations and speeches were compiled in 1906. Depew died on April 3, 1928.

Bibliography: C. M. Depew, *One Hundred Years of American Progress*; "Excerpts from Mr. Autobiography" in *Northern Magazine* vol. 10, pp. 1, 565, 66-670 (Nov. Dec. 1922); *His Memoirs of 1840s-1860s* (1927).

DEPEW, a manufacturing village of Erie county, N.Y., U.S., on the L. of Buffalo on federal highway 20, served by the Erie, the Lehigh Valley, the Elgin Valley and the New York Central railways. The population in 1930 was 7,217 and in 1940 it was 6,084. It was incorporated in 1894.

DEPLOY, a military term signifying to extend a force or unit of troops into a more open formation, e.g., from column, the marching and approach (*q.v.*) formation, into the whirly the

greatest number of its weapons can be brought to bear

DEPORTATION Deportation or transportation is a system of punishment for crime involving the removal of the criminal to a penal settlement outside his own country. It is to be distinguished from mere expulsion from a country, though the term "deportation" is used in that sense in the English law relating to aliens (see *ALIEN*). It is also to be distinguished from extradition (*q.v.*), which is a procedure applicable to persons wanted for trial under another jurisdiction. The deportation or transportation of convicts from the United Kingdom ceased in 1857, though undesirable persons may be removed from British territories where the Foreign Jurisdiction acts apply (mainly British protectorates) under various orders in council.

English Practice—At a time when English criminal law bristled with capital felonies, when the pickpocket or sheepstealer was hanged when, to use Sir Samuel Romilly's phrase, the laws of England were written in blood, another and less sanguinary penalty rose to great favour, namely, transportation. The deportation of undesirable persons beyond the seas was common in the 17th century and was not unknown in earlier times. The Vagrancy act, 1597, empowered justices in quarter sessions to banish offenders and order them to be conveyed into such parts beyond the seas as should be assigned by the privy council.

But it was only toward the end of the 17th century that transportation began to be used as a regular part of the penal system and as a substitute for capital punishment. Its use in this way became more frequent as people came to realize that the criminal law was unduly severe. Pardons were frequently granted to capital offenders on condition that they consented to transportation. The Habeas Corpus act, 1679, recognized this procedure and in 1717 a statute authorized the courts to order transportation as a direct punishment. In 1768 the power of the judges to respite capital convictions and substitute transportation was confirmed by parliament and the procedure was simplified.

At first transportation was to the American colonies, but this ceased after they had declared their independence in 1776. Instead, it was provided that convicts sentenced to transportation should be employed on hard labour at home and detained in prison ships or "hulks." Transportation was resumed in 1779, and for a time Africa was the destination, but because of the climate this proved disastrous and attention switched to the possibility of using the vast new territories of Australasia, so recently explored by Capt. James Cook, for the purpose of founding penal settlements. An expedition consisting of nine transports and two men-of-war, the first fleet of Australian history, sailed on May 13, 1787 for New South Wales. A few free families were also encouraged to emigrate, but they were lost in the mass they were intended to leave.

Shipsloads of convicts continued to pour into Australia year after year and, as the influx increased, so did the difficulty of finding employment for all the prisoners. The free settlers were too few to give work to more than a small proportion. Moreover, a new policy had been initiated by the governor, Lachlan Macquarie, of paying more attention to the interests of the convicts and discouraging the immigration of any save those who "came out for their country's good." The great bulk of the convict labour thus remained in government hands, and some of the works under taken and carried out were of incalculable service to the young colony. Indeed, its early advance in wealth and prosperity was due in large part to the magnificent roads, bridges and other facilities of intercommunication for which it was indebted to Governor Macquarie.

However, with the increasing numbers of convicts, some change in the system was inevitable, and the policy of "assignment" was introduced. Convicts were freely loaned to anyone who would relieve the authorities of responsibility for them. This system developed its own abuses, and there is a long story of effort and failure and scandal. Suffice it to say that, chiefly because of the protests of the colonists themselves, the system of transportation to New South Wales was abandoned in 1840, and although for a time Van Diemen's Land (later known as Tasmania) was used as an alternative destination, the system of transportation was even-

tually abolished by the Penal Servitude acts, 1853 and 1857 (see *PRISON*).

French Practice—France first adopted deportation of its criminals during the revolutionary period. A colony of convicts was planned for Madagascar in 1797, but it never materialized. In 1797 a small group of political prisoners was deported to French Guiana, and in the following year about 500 prisoners were sent there. In 1823 the philanthropist Baron Milius formed an expedition consisting of a company of military workers, about 50 orphan apprentices, and others making a total of 164 persons who settled on the banks of the Mana in French Guiana. The experiment was a failure, troops were needed to keep order and the principle of deportation was formally condemned by publicists and by the government. But in 1854 it was reintroduced into the French penal code with many high sounding phrases, only to fail in practice, with deplorable results. Deportation to Guiana was not entirely abandoned, but instead of native-born French, only convicts of subject races, Arabs, Annamites and Asiatic blacks, were sent, with no better success as regards colonization.

In 1864, however, it was possible to divert the stream elsewhere. New Caledonia, an island in the Australian Pacific, was annexed by France in 1853, and ten years later it became a new settlement for convict emigrants. A first shipload was disembarked in 1864 at Nouméa, and the foundations of the city were laid. Outwardly all went well with the settlement. The population increased steadily, rising from 600 in 1867 to more than 9,600 at the end of 1883. But from that time forward the numbers transported each year fell, and as the colony had become almost exclusively penal, its natural growth as a prosperous colonial community was retarded. The reason for the falling off in the numbers transported to this South Pacific island, with its fairly temperate climate and fertile soil, was that it had been found that fear of being deported there no longer proved a deterrent. The French administration therefore resumed the deportation of French born whites to Guiana, which was notoriously unhealthy. Convicts who showed some promise of rehabilitation were still sent to New Caledonia, but those with the worst records who were regarded as incorrigible were sent to the settlements on the equator. After 1897 no more convicts were transported to New Caledonia.

Convicts were still transported to French Guiana in the 20th century, and dreadful disclosures were made about conditions on the islands near Cayenne where prisoners were held, particularly the notorious Devil's Island. In 1938 France abolished transportation, although persons already transported were still detained. The penal colonies in French Guiana were finally abolished by a decree of the Free French government during World War II.

(J. E. H. W.)

United States—Under the laws of the United States, deportation is not banishment or punishment for crime, deportation proceedings are civil and not criminal. This is in sharp contrast with the deportation laws of England, the USSR, France, Italy, Portugal and some other countries where their own citizens or subjects are sometimes exiled or deported to the colonial penal colonies as punishment for crime.

In the United States every person is considered an alien who is not a native born or naturalized citizen, and only aliens can be deported. It has never been the policy of the United States government to punish criminally aliens who remain after the time for which they were admitted has expired, or who have entered unlawfully for the first time in contravention to immigration laws. Deportation is the only remedy.

A legally admitted alien cannot be deported without due process of law but he has no absolute right to remain (*Carlson v. Landon*, 186 F. [2d] 183). Under our immigration laws, the entrance of an alien illegally is not a crime but he may be deported for having entered without a visa. The alien has the burden of proof to show his lawful right to remain (*La Buda v. Karnik*, 47 F. [2d] 944). While an alien is allowed to remain, he is accorded constitutional protection, but his licence to remain is revocable at any time (*Turner v. Williams*, 194 U.S. 279, *Chuvaco Truco v. Forbes*, 228 U.S. 549, *Vojtauer v. Shaugnessy*, 273 U.S. 103).

An alien residing in the United States is always subject to de-

portation on any statutory grounds until he has been admitted to citizenship. To deport one who has acquired citizenship by naturalization, a proceeding must first be brought in a United States district court by a United States attorney to revoke such citizenship, usually on the ground that it had been obtained by fraud. If citizenship is revoked by an order of the court the person again becomes an alien subject to deportation. However, if he acquired United States citizenship by birth such proceeding cannot be brought against him, thus he cannot be deported.

An important distinction is to be made between aliens seeking admission who are stopped at the borders and aliens who have entered the country but whose deportation is sought. The former are excluded while the latter are deported. In exclusion the transportation company that brought the alien who is excluded upon arrival must take him back. In deportation the alien is deported at the expense of the U.S. government to his native country or, if that is not possible, to any country where he had acquired a domicile or to the foreign port or place of embarkation.

If no country will accept the alien and even the country of his birth refuses to grant him permission to enter, he may be detained at Ellis Island, New York harbour, for the rest of his life or until such time as the United States government can find a country that will admit him (*Shaughtnessy v. Mezer*, 345 U.S. 206).

(S. Ks.)

Other Countries—Penal exile has been practised by many other countries as a method of secondary punishment. Russia from 1823 onward directed a continuous stream of offenders to Siberia, and at one time the yearly average sent was 18,000. Transportation of Russian convicts by sea to the island of Sakhalin in the far east was also used. This island was hopefully intended as an outlet for released convicts where they could be rehabilitated by their own efforts, in precisely the same manner as was tried in Australia and New Caledonia. The result followed British and French experience in every respect, and before World War I it was widely recognized in Russia that transportation had failed. However, under the Communist regime, as H. E. Barnes and N. K. Teeters relate in *New Horizons in Criminology* (Prentice Hall, Inc., New York, 1951), "the Czarist system of sending prisoners to Siberia has been continued on an even greater scale, and, apparently, with just as much brutality. There is, however, one difference. Under the Czar's large portion of those exiled were criminals in the conventional sense. Under the Soviet rule, most of those sent to Siberia have been political prisoners." In the view of these writers, "after making all qualifications necessary for the exaggerations of the bitterly anti-Soviet writers, it seems likely that the conditions in the Soviet labor camps in Siberia are as brutal and degrading as anything which was under the Czar's."

Portugal practised transportation as far back as the 15th century. In modern times it has tried deportation to the African colony of Angola. This has been on a small scale, side by side with free emigration, and has been fairly successful. Spain resorted to banishment on a limited scale in the 16th century, and penal settlements were retained at Ceuta and in Africa for many centuries. In 1907 the African prisons were ordered to be abolished, and the penal settlement at Ceuta was closed in 1911.

Italy introduced deportation to various agricultural penal colonies on the islands around its coast. Under the Fascist regime thousands of political prisoners were sent to the nonagricultural islands off the coast of Sicily.

Transportation must be regarded as a most primitive solution to the problem of disposing of prisoners. Moreover, it is a solution likely to be accompanied by deplorable conditions and most unlikely to be a success. Indeed, it has been said that it has proved a ghastly failure wherever it has been tried.

(J. E. H. W.)

DEPOSIT, anything laid down or separated, as in geology,

any mass of material accumulated by a natural agency (see BED), and in chemistry, a precipitate or matter settling from a solution or suspension. Deposit is also used in the sense of earnest or security for the performance of a contract, in the law of contract, deposit or simple bailment is delivery or bailment of goods in trust to be kept without recompense and redelivered on demand (see BAILMENT). (For banking deposits, see BANKING.)

DEPOT, a place where goods may be stored or deposited, such as a furniture or forage depot, the accumulation of military stores, especially in the theatre of operations (from the Fr. *Dépôt*, Lat. *depositum*, laid down). In America the word is used of a railway station whether for passengers or goods, in Great Britain on railways the word, when in use, is applied to goods stations. A particular military application is to a depot situated as a rule in the centre of the recruiting district of the regiment or other unit, where recruits are received and undergo preliminary training before joining active troops. Such depots are maintained in peacetime by armies which supply distant or overseas garrisons, in an army raised by compulsory service and quartered in its own country, the regiments are usually stationed in their own districts and on their taking the field for war leave behind a small nucleus for the formation and training of drafts to be sent out later. These nucleus troops are generally called depot troops.

DEPRECIATION Depreciation is an accounting charge for the cost of durable property, spread over its economic life. Depreciation covers wear and tear from use, physical deterioration from age and exposure to the elements and obsolescence, i.e., loss of usefulness arising from availability of newer and more efficient types of goods serving the same purpose. It does not cover losses from sudden and unexpected destruction of the usefulness of property—major fires and accidents, theft, war damage or adverse court decisions—nor from declining price levels. Depreciation applies both to tangible property such as machinery and buildings and to intangibles of limited life such as leaseholds and copyrights. Similar costs are involved in depletion and maintenance. Depletion is depreciation on property which cannot be reproduced, such as a body of ore being mined or a stand of timber being cut and not reforested. Maintenance is cost incurred in keeping property in good condition, as by painting a house or replacing defective parts in a truck. Tangible property subject to depreciation also involves maintenance. Where "full maintenance" aims to keep the property intact without deterioration, however (as with a railway roadbed), there may be no depreciation charge. A main object of keeping these costs is to measure income correctly so that if the whole supposed income of a business is withdrawn for the private use of the owners it will not later be discovered that the assets of the business have dwindled away. This leads to the rule that depreciation during the working life of a piece of property must equal the original cost of the property, less ultimate scrap value. For convenience, depreciation accounts are usually kept for groups of assets with similar characteristics and working life, and the estimated average working life of the group is used in figuring depreciation. Since this average can take into account minor losses from fire, etc., depreciation covers such losses insofar as they are self-insurable within the business in question.

The general rule of charging off a depreciable asset during its life does not settle annual charges. Allocation among years is recognized as arbitrary, and in practice is strongly influenced by income tax regulations. Straight-line, fixed percentage and, more rarely, annuity methods of depreciation—giving respectively constant, gradually decreasing and gradually increasing charges—are standard. Sometimes charges vary with use (for instance, with the number of miles per year a truck is driven). Special rules allow depletion for tax purposes to exceed original cost.

Basing depreciation on historical cost rather than on probable replacement cost, and on arbitrary rules rather than on actual use, is presumably necessary for definite tax liability and audits of accounts. But very imperfect measurement of the actual using up of property results in times when price levels change. Department of commerce estimates of total recorded depreciation and depletion in the United States were \$4,400,000,000 for 1929, \$44-

300,000,000 for 1937, for example. But since prices and activity were both much lower in 1931, the cost of new property adequate to replace that used up is much lower than in 1929. Thus after a fall of prices, depreciation overstates the using up of capital, and consequently current income and the proportion of new buildings, machinery and other property which exceeds replacement requirements ("net capital formation") are overstated, after a rise of prices the opposite is true, as for example during the inflation following World War II.

In view of technical progress, the cost of new equipment of stated capacity tends to fall from year to year so that maintaining the value of equipment by reinvesting depreciation funds involves some expansion of physical capacity. (See also CAPITAL AND INTEREST, FINANCIAL STATEMENTS, INVESTMENTS IN BUSINESS, NATIONAL SAVINGS) (A G H R, X)

DEPRETIS, AGOSTINO (1813-1887), Italian statesman, was born at Mezzana Corte, in the province of Pavia, on Jan. 31, 1813. He belonged to the Giovine Italia, and was nearly captured by the Austrians while smuggling arms into Milan. Elected deputy in 1848, he founded the journal *Il Diritto*. In 1860 he was sent on an abortive mission to Sicily to find a compromise between the Cavour and the Garibaldi policies.

As a member of Urbano Rattazzi's cabinet of 1862 he arranged with Garibaldi the expedition which ended in disaster at Aspromonte.

He was a member of Bettino Ricasoli's cabinet of 1866 and on the death of Rattazzi (1873) became the leader of the left. He was premier in 1876-78 and for a brief period in 1879.

Minister of the interior in Benedetto Cairoli's cabinet of 1879, he was again prime minister from 1881 until his death on July 29, 1887.

He reconstituted his cabinet four times, alternately bestowing portfolios upon Cesare Ricotti Magnani, the count di Robilant and other Conservatives so as to complete the political process known as *trasformismo*. A few weeks before his death he repented of his transformist policy, and again included Francesco Crispi and Giuseppe Zanardelli in his cabinet.

During his long term of office he abolished the grist tax, extended the suffrage, completed the railway system, aided Pasquale Mancini in forming the Triple alliance and initiated colonial policy by the occupation of Massawa. On the other hand, however, he vastly increased indirect taxation, corrupted the fibre of the several parliamentary parties and impaired the stability of Italian finance.

DEPTFORD, a southeastern metropolitan and parliamentary borough of London, Eng., bounded north by Bormondsey, north east by the Thames river, east by Greenwich, south by Lewisham and west by Camberwell. Pop. (1951) 75,694. Area 24 sq mi. The name (Depeford) is connected with a ford over the Ravensbourne, a stream entering the Thames through Deptford creek. In 1885 the parish of St. Nicholas, which included the old village of Lower Deptford, a large stretch of water frontage west of the creek, the old cattle market and Sayes court gardens (a part of the former gardens of Sayes court), was transferred to Greenwich in order to bring the latter up to borough status. Since then the borough of Deptford has comprised only the parish of St. Paul (Upper Deptford), the church of which dates from 1712-30.

Southward from the river the land rises, on a low gravel terrace, to 154 ft. on Telegraph hill. The southern part of the borough is largely residential, factories increasing in number toward the river. There is a very great variety of industries one of the chief of which is the timber import-export business that Deptford shares with Rotherhithe, the adjoining district up the river, many timber wharves front the Surrey canal that leads down to the Surrey docks in Rotherhithe.

Henry VIII established a royal naval dockyard at Deptford in 1513 and the shipbuilding industry flourished until wooden ships gave place to iron. Later it became the Royal Victoria Victualling yard and is now an army supply depot. Trinity House (qv) was founded in 1514 by Henry VIII but moved to Stepney in the 17th century and to Tower hill in 1795. Sayes court was demolished in 1729, after having been the residence of the duke of

Sussex in the reign of Elizabeth I, of John Evelyn in the next century and of Peter the Great during his short stay in Deptford in 1698. Part of the gardens is now Deptford park (17 ac.). The Goldsmith's college, New Cross, was built in 1843 and the town hall in 1900-03.

DEPTH, in military language, the space over which a body of troops is distributed from front to rear. In a tactical sense it is used to express the idea of, and need for, so distributing a force or unit as to have adequate reserves behind the fighting line to exploit initial success or to meet an emergency. In World War I the tendency was for the distribution of a force or unit to attain an ever increasing depth in proportion to, and with a proportionate reduction of, its frontage.

DEPTH CHARGE See MINES (NAVAL).

DEPUTY, one appointed to act or govern instead of another, one who exercises an office in another man's right, a substitute, in representative government a member of an elected chamber. Various officials are empowered by statute to appoint deputies. Thus, a clerk of the peace, in case of illness, incapacity or absence, may appoint a fit person to act as his deputy. While judges of the supreme court cannot act by deputy, county court judges and recorders can, in cases of illness or unavoidable absence, appoint deputies. So can registrars of county courts and returning officers at elections.

In many countries, members of the lower house of parliament are called deputies.

DE QUINCEY, THOMAS (1785-1859), English author, was born at Greenheys, Manchester, the fifth child in a family of eight (four sons and four daughters). His father left his wife and six children a clear income of £1,600 a year. Thomas was from infancy a shy, sensitive child, with a constitutional tendency to dreaming by night and by day, and, under the influence of an elder brother, a lad "whose genius for mischief amounted to inspirations," who died in his 16th year, he spent much of his boyhood in imaginary worlds of their own creating. The amusements and occupations of the whole family, indeed, seem to have been mainly intellectual, and in De Quincey's case, emphatically, "the child was father to the man." "My life has been," he affirms in the *Confessions*, "on the whole the life of a philosopher, from my birth I was made an intellectual creature, and intellectual in the highest sense my pursuits and pleasures have been." He received a rather desultory education, though at 15 he could speak Greek fluently. He ran away from his last school, Manchester Grammar school, and was sent into the country in Wales. Then he again ran away, this time to London, where, he says, commenced "that episode, or impassioned parenthesis of my life, which is comprehended in *The Confessions of an English Opium Eater*." This London episode extended over a year or more, his money soon vanished, and he was in the utmost poverty, he obtained shelter for the night in Greek street, Soho, from a moneylender's agent, and spent his days wandering in the streets and parks, finally the lad was reconciled to his guardians, and in 1803 was sent to Worcester college, Oxford, being by this time about 19. It was in the course of his second year at Oxford that he first tasted opium—having taken it to allay neuralgic pains. De Quincey's mother had settled at Weston Lea, near Bath, and on one of his visits to Bath, De Quincey made the acquaintance of Coleridge, he took Mrs. Coleridge to Gasmere, where he became personally acquainted with Wordsworth.

After finishing his career of five years at college in 1808 he kept terms at the Middle Temple, but in 1809 visited the Wordsworths at Gasmere, and in the autumn returned to Dove cottage, which he had taken on a lease. His choice was of course influenced partly by neighbourhood to Wordsworth, whom he early appreciated, having been, he says, the only man in all Europe who quoted Wordsworth so early as 1802. His friendship with

"The following account has been abbreviated for this ed. Its original author, John Ritchie Findlay (1824-1898), proprietor of *The Scotsman* newspaper, and the donor of the Scottish National Portrait gallery in Edinburgh, had been intimate with De Quincey, and in 1886 published his *Personal Recollections* of him.

Wordsworth decreased within a few years, and when in 1834 De Quincey published in *Tait's Magazine* his reminiscences of the Grasmere circle, the indirect references to the Wordsworths contained in the article led to a complete cessation of intercourse. Here also he enjoyed the society and friendship of Coleridge, Southey, and especially of Prof. Wilson, as in London he had of Charles Lamb and his circle. He continued his classical and other studies, especially exploring the, at that time, almost unknown region of German literature, and indicating its riches to English readers. Here also, in 1810, he married Margaret Simpson, the "dear M———" of whom a charming glimpse is accorded to the reader of the *Confessions*, his family came to be five sons and three daughters.

For about a year and a half he edited the *Westmorland Gazette*. He left Grasmere for London in the early part of 1820. The English received him with great kindness and introduced him to the proprietors of the *London Magazine*. It was in this journal in 1821 that the *Confessions* appeared. De Quincey also contributed to *Blackwood*, to *Knight's Quarterly Magazine*, and later to *Tait's Magazine*. His connection with *Blackwood* took him to Edinburgh in 1838, and he lived there for 12 years, contributing from time to time to the *Edinburgh Literary Gazette*. His wife died in 1837, and the family eventually settled at Lasswade, but from this time De Quincey spent his time in lodgings in various places, staying at one place until the accumulation of papers filled the rooms, when he left them in charge of the landlady and wandered elsewhere. After his wife's death he gave way for the fourth time in his life to the opium habit, but in 1844 he reduced his daily quantity by a tremendous effort to six grains, and never again yielded. He died in Edinburgh on Dec. 8, 1859, and is buried in the West Churchyard.

During nearly 50 years De Quincey lived mainly by his pen. His patrimony seems never to have been entirely exhausted, and his habits and tastes were simple and inexpensive, but he was reckless in the use of money, and had debts and pecuniary difficulties of all sorts. The famous *Confessions of an English Opium Eater* was published in a small volume in 1822, and attracted attention, not simply by its personal disclosures, but by the extraordinary power of its dream-painting. No other literary man of his time, it has been remarked, achieved so high and universal a reputation from such merely fugitive efforts. The only works published separately (not in periodicals) were a novel *Klosterheim* (1832), and *The Logic of Political Economy* (1844). After his works were brought together, De Quincey's reputation was not merely maintained, but extended. For range of thought and topic, within the limits of pure literature, no like amount of material of such equality of merit proceeded from any eminent writer of the day. However profuse and discursive, De Quincey is always polished, and generally exact—a scholar, a wit, a man of the world and a philosopher, as well as a genius. He looked upon letters as a noble and responsible calling, in his essay on Oliver Goldsmith he claims for literature the rank not only of a fine art, but of the highest and most potent of fine arts, and as such he himself regarded and practised it. He drew a broad distinction between "the literature of knowledge and the literature of power," asserting that the function of the first is to teach the function of the second to *inspire*—maintaining that the meanest of authors who moves his pre-eminence over all who merely teach that the literature of knowledge must perish by suppression, while the literature of power is "triumphant for ever as long as the language exists in which it speaks." It is to this class of motive literature that De Quincey's own works essentially belong, it is by virtue of that vital element of power that they have emerged from the rapid oblivion of periodicalism, and live in the minds of later generations. But their power is weakened by their volume.

De Quincey fully defined his own position and claim to distinction in the preface to his collected works. These he divides into three classes, "first, that class which proposes primarily to amuse the reader," such as the *Narratives*, *Autobiographic Sketches*, etc., second, "papers which address themselves purely to the understanding as an insulated faculty, or do so primarily," such as the

essays on Essenism, the Caesars, Cicero, etc., and finally, as a third class, "and, in virtue of their aim, as a far higher class of compositions," he ranks those "modes of impassioned prose ranging under no precedents that I am aware of in any literature," such as the *Confessions* and *Suspense of Profundity*. The high claim here asserted has been questioned, and short and isolated examples of eloquent apostrophe, and highly wrought imaginative description, have been cited from Rousseau and other masters of style, but De Quincey's power of sustaining a fascinating and elevated strain of "impassioned prose" is allowed to be entirely his own. Another obvious quality of all his genius is its overflowing fullness of allusion and illustration, recalling his own description of a great philosopher or scholar—"Not one who depends simply on an infinite memory, but on an infinite and electrical power of combination, bringing together from the four winds, like the angel of the resurrection, what else were dust from dead men's bones into the unity of breathing life."

In politics, in the party sense of that term, he would probably have been classed as a Liberal Conservative or Conservative Liberal—at one period of his life perhaps the former, and at a later the latter. As he advanced in years his views became more and more decidedly liberal, but he was always as far removed from Radicalism as from Toryism, and may be described as a philosophical politician, capable of classification under no definite party name or colour. Of political economy he had been an early and earnest student, and projected, if he did not so far proceed with, an elaborate and systematic treatise on the science, of which all that appears, however, are his fragmentary *Dialogues* on the system of Ricardo, published in the *London Magazine* in 1824, and *The Logic of Political Economy* (1844). How wide and varied was the region he traversed a glance at the titles of the papers which make up his collected (or more properly, selected) works (for there was much matter of evanescent interest not reprinted), sufficiently shows. Some things in his own line he has done perfectly, he has written many pages of magnificently mixed arguments, irony, humour and eloquence, which, for sustained brilliancy, richness, subtle force and purity of style and effect, have simply no parallels, and he is without peer the prince of dreamers. The use of opium no doubt stimulated this remarkable faculty of reproducing in skilfully selected phrase the grotesque and shifting forms of that "cloudland, gorgeous land," which opens to the sleep-closed eye.

It has been complained that, in spite of the apparently full confidences of the *Confessions* and *Autobiographic Sketches*, readers are left in comparative ignorance, biographically speaking, of the man De Quincey. Two passages in his *Confessions* afford sufficient clues to this mystery. In one he describes himself "as framed for love and all gentle affections," and in another confesses to the "besetting infirmity" of being "too much of an eudaemonist." "I hanker," he says, "too much after a state of happiness, both for myself and others, I cannot face misery, whether my own or not, with an eye of sufficient firmness, and am little capable of surmounting present pain for the sake of any recessionary benefit." His sensitive disposition dictated the ignoring in his writings of traits merely personal to himself, as well as his ever-recurrent resort to opium as a doorway of escape from present ill, and prompted those habits of seclusion, and that apparently capricious abstraction of himself from the society not only of his friends, but of his own family, in which he from time to time persisted. He confessed to occasional accessions of an almost irresistible impulse to flee to the labyrinthine shelter of some great city like London or Paris—there to dwell solitary amid a multitude, hurried by day in the cloister like recesses of mighty libraries, and stealing away by night to some obscure lodging. Long indulgence in seclusion, and in habits of study the most lawless possible in respect of regular hours or any considerations of health or comfort—the habit of working as pleased himself without regard to the divisions of night or day, of times of sleeping or waking, even of the slow procession of the seasons—had latterly so disinclined him to the restraints, however slight, of ordinary social intercourse, that he very seldom submitted to them. On such rare occasions, however, as he did appear, per-

haps at some simple meal with a favoured friend, or in later years in his own small but refined domestic circle, he was the most charming of guests, hosts or companions. A short and fragile, but well proportioned frame, a shapely and compact head, a face beaming with intellectual light, with rare, almost feminine beauty of feature and complexion, a fascinating courtesy of manner, and a fullness, swiftness and elegance of silvery speech—such was the irresistible "mortal mixture of earth's mould" that men named De Quincey. It was impossible to deal with or judge him by ordinary standards—not even his publishers did so. Much no doubt was forgiven him, but all that needed forgiveness is covered by the kindly veil of time, while his merits as a master in English literature are still gratefully acknowledged. (J R F)

Bibliography.—In 1853 De Quincey began to prepare an ed. of his works *Selected Grave and Gay Writings Published and Unpublished* (1853-60), followed by a second ed. (1863-71) with notes by James Hogg and two additional vols., a further supplementary vol. appeared in 1878. The first comprehensive ed., however was printed in America (1850-55), and the "Riverside" ed. (1877) is still fuller. The standard English ed. is *The Collected Writings of Thomas De Quincey* (Edinburgh, 1889-90), edited by David Masson, who also wrote his biography (1881) for the "English Men of Letters" series. *The Uncollected Writings of Thomas De Quincey* (1890) contains a preface and annotations by James Hogg, *The Posthumous Writings of Thomas De Quincey* (1891-93) were edited by A. H. Japp ("H. A. Page"), who wrote the standard biography, *Thomas De Quincey: his Life and Writings* (2nd ed., 1895), and *De Quincey Memorials* (1891). See also Arvede Barne *Nervosis* (1898), Sir L. Stephen *Hours in a Library*, H. S. Salt *De Quincey* (1904), and *De Quincey and his Friends* (1895), a collection edited by James Hogg, which includes essays by Dr. Hill Burton and Shadworth Hodgson. See also editions of the *Confessions* (1927) by G. Saintsbury, and of the *Diary* (1927) by H. A. Eaton.

DERA GHAZI KHAN, a town and district of British India, in the Punjab. The original town was founded at the close of the 15th century and named after Ghazi Khan, son of Haji Khan, a Baluch chieftain, who after holding the country for the Langah sultans of Multan had made himself independent. The greater part of this town was washed away by the Indus in 1908-09 and the new town, built near by, is now the headquarters of the District.

The district, which consists of an area of 9,364 sq. mi., is a long narrow strip of country, 193 m. in length, sloping gradually from its western boundary hills to the river Indus on the east. Although liable to great extremes of temperature, and to a very scanty rainfall, the district is not unhealthy. The population in 1941 was 581,350, the great majority being Baluch Mohammedans. The principal exports are wheat and indigo. The only manufacturing are for domestic use. There is no railway in the district. In the hills beyond the limit of the district is an area occupied by Biloch tribes which is administered by the deputy commissioner of Dera Ghazi Khan. The frontier tribes here include the Kasranis, Boddars, Khossas, Lagharis, Khetrans, Gurcharms, Mazars, Marris and Bugtis. The chief of these are described under their separate names.

DERAIL, a device used mainly on the sidings of railways to prevent a car that has been moved by wind, gravity or by the error of trammen from running foul of the main track. It is also frequently used to protect men at work under a car. The derail is variously designed, but generally acts by providing a surface on which the flange of one wheel mounts and crosses over the head of the rail, dragging the wheel at the other end of the axle off its rail. Each pair of wheels follows in turn and, being forced over the irregularities of the road bed, soon bring the car to a full stop. Some derails are portable, but most are fixed definitely in place and are operated by hand, in unison with a switch or mechanically from a central point. The illustration shows a manual derail with signal target, in operating position.

DERAIN, ANDRÉ (1880-), French painter, was born at Chatou (France), on June 10, 1880. For a considerable time he shared a studio with the landscape painter Vlaminck, he then made the acquaintance of Picasso, Georges Braque and the poet Guillaume Apollinaire. It was from this small group that Cubism developed. Yet Derain cannot be considered as a representative of the Cubist school, his best works adhere to the great tradi-

tions of the classic landscapes, and are formal in character and restrained in colour, while his figures exhibit a grandeur and serenity, which reveal an admira of the great masters.

DERA ISMAIL KHAN, a town, cantonment and district in the Derajat division of the North West Frontier Province of India. The town is situated near the right bank of the Indus, here crossed by a bridge of boats during half the year. Pop. (1941) 48,210. It takes its name from Ismail Khan, a Baluch chief who settled here towards the end of the 15th century, and whose descendants ruled for 300 years. The old town was swept away by a flood in 1833. The main channel of the Indus which often changes, was in 1927 2 mi. from the town. The town contains a large bazaar for Afghan traders and is the residence of many Mohammedan gentry. Since the occupation of Waziristan the garrison has been reduced to half a brigade. There is considerable through trade with Afghanistan by the Gomal pass.

The district—area 4,216 sq. mi., pop. (1941) 298,131—was formerly divided by the Indus, which intersected it from north to south. To the west of the Indus the country resembles Dera Ghazi Khan. To the east of the present bed of the river a wide tract, the *Kachi*, is exposed to river action. Beyond this, the country rises abruptly, and a barren, almost desert plain stretches eastwards, sparsely cultivated, and inhabited only by nomadic tribes. In 1901 the trans-Indus tract was allotted to the newly formed North-West Frontier Province, the cis-Indus tract remaining in the Punjab jurisdiction. The former cis-Indus portions of the Dera Ismail Khan and Bannu districts is now the Punjab district of Mianwali.

The district is the junction of Pathan and Baluch tribes, the Pathan element predominating. The chief frontier tribes are the Sheranis and Ustarans and Bhattans.

DERAIYEH (Arab *Dariya*). A city of Arabia formerly the capital of the Wahhabis and of considerable importance prior to 1819 when it was captured by Ibrahim Pasha. It now consists of five walled villages amongst the ruins, with a population of about 1,500 inhabitants, the Wahhabi capital is now Riyadh.

DERBENT or **DERBEND**, a town in the A S S R of Dagestan, on the western shore of the Caspian, 42° 4' N., 48° 15' E. Pop. (1926) 23,111. It occupies a narrow strip of land beside the sea, from which it climbs up the steep heights inland. The environs are occupied by vineyards, gardens and orchards, in which madder, saffron and tobacco, as well as figs, peaches, pears and other fruits, are cultivated. Earthenware, weapons and silk and

BY COURTESY OF THE MAINTENANCE EQUIPMENT CO.

FRONT AND REAR VIEWS OF THE BLUE FLAG PORTABLE DERAIL.

cotton fabrics are the principal products of the manufacturing industry. Recently a wool spinning factory has been built, and steamers call at the port, which has a lighthouse and cold storage accommodation for the fruit and fish industry. To the north of the town is the monument of the *Kirk-lar*, or "forty heroes," who fell defending Dagestan against the Arabs in 728, and to the south lies the seaward extremity of the Caucasian wall (50 m. long), otherwise known as Alexander's wall, blocking the narrow

pass of the Iron Gate or Caspian Gates (*Portae Albanae* or *Portae Caspiae*). This, when entire, had a height of 20 ft and a thickness of about 10 ft, and with its iron gates and numerous watch-towers formed a valuable defence of the Persian frontier. Derbent is usually identified with Albana, the capital of the ancient Albania. The modern name, a Persian word meaning 'iron gates,' came into use when the city was re-founded by Kavād of the Sassanian dynasty of Persia. The walls and the citadel are believed to belong to the time of Kavād's son, Khosrū (Chosroes) Anosharvan. In 728 the Arabs entered into possession, and established a principality in the city, which they called Bab-el-Awāk ('the principal gate'), Bab el Khadid ('the iron gate'), and Serail el-Dagab ('the golden throne'). The celebrated caliph, Harun al Rashid, lived in Derbent at different times, and brought it into great repute as a seat of the arts and commerce. In 1220 it was captured by the Mongols, and in the course of the succeeding centuries it frequently changed masters. In 1722 Peter the Great of Russia wrested the town from the Persians, but in 1736 the supremacy of Nadir Shah was again recognized. In 1796 Derbent was besieged by the Russians, and in 1813 incorporated in the Russian empire. During the Civil War 1917 to 1921, the greater part of the town was destroyed.

DERBY, EARLS OF. The 1st earl of Derby was probably Robert de Ferrers (d. 1139), who is said by John of Hexham to have been made an earl by King Stephen after the battle of the Standard in 1138. Robert and his descendants retained the earldom until 1266, when Robert (c. 1247–c. 1279), probably the 6th earl, having taken a prominent part in the baronial rising against Henry III., was deprived of his lands and practically of his title. These earlier earls of Derby were also known as Earls Ferrers, or de Ferrers, from their surname, as earls of Tutbury from their residence, and as earls of Nottingham because this county was a lordship under their rule. The large estates which were taken from Earl Robert in 1266 were given by Henry III. in the same year to his son, Edmund, earl of Lancaster, and Edmund's son, Thomas, earl of Lancaster, called himself Earl Ferrers. In 1337 Edmund's grandson, Henry (c. 1299–1361), afterwards duke of Lancaster, was created earl of Derby, and this title was taken by Edward III.'s son, John of Gaunt, who had married Henry's daughter, Blanche. John of Gaunt's son and successor was Henry, earl of Derby, who became king as Henry IV. in 1399.

In October 1485 Thomas, Lord Stanley, was created earl of Derby, and the title has since been retained by the Stanleys. It is derived, not from Derbyshire, but from the hundred of West Derby in Lancashire. Thomas also inherited the sovereign lordship of the Isle of Man, granted by the crown in 1406 to his great grandfather, Sir John Stanley, and this sovereignty remained in possession of the earls of Derby till 1736, when it passed to the duke of Atholl.

The earl of Derby is one of the three 'catkin earls,' the others being the earls of Shrewsbury and Huntingdon. The term 'catkin' is possibly a corruption of *quatre-skin*, derived from the fact that in ancient times the robes of an earl (as depicted in some early representations) were decorated with four rows of ermine, as in the robes of a modern duke, instead of the three rows to which they were restricted in later centuries. The three 'catkin' earldoms are the only earldoms now in existence which date from creations prior to the 17th century.

THOMAS STANLEY, 1st earl of Derby (c. 1435–1504), was the son of Thomas Stanley, who was created Baron Stanley in 1456 and died in 1459. His grandfather, Sir John Stanley (d. 1414), had founded the fortunes of his family by marrying Isabel Lathom, the heiress of a great estate in the hundred of West Derby in Lancashire; he was lieutenant of Ireland in 1389–1391, and again in 1399–1401, and in 1405 received a grant of the lordship of Man from Henry IV. The future earl of Derby was a squire to Henry VI. in 1454, but not long afterwards married Eleanor, daughter of the Yorkist leader, Richard Neville, earl of Salisbury. At the battle of Blore Heath in Aug. 1459 Stanley, though close at hand with a large force, did not join the royal army, whilst his brother William fought openly for York. In 1461 Stanley was made chief justice of Cheshire by Edward IV.,

but ten years later he sided with his brother in law Warwick in the Lancastrian restoration. Nevertheless, after Warwick's fall, Edward made Stanley steward of his household. Stanley served with the king in the French expedition of 1475, and with Richard of Gloucester in Scotland in 1482. About the latter date he married, as his second wife, Margaret Beaufort, mother of the exiled Henry Tudor. Stanley was one of the executors of Edward IV. and was at first loyal to the young king Edward V. But he acquiesced in Richard's usurpation, and retaining his office as steward avoided any entanglement through his wife's share in Buckingham's rebellion. He was made constable of England in succession to Buckingham, and was granted possession of his wife's estates with a charge to keep her in some secret place at home. Richard could not well afford to quarrel with so powerful a noble, but early in 1485 Stanley asked leave to retire to his estates in Lancashire. After Henry of Richmond had landed, Stanley made excuses for not joining the king. On the morning of Bosworth (Aug. 22), Richard summoned Stanley to join him, and when he received an evasive reply ordered his son, George, Lord Strange, whom Stanley had given as a hostage, to be executed. In the battle it was William Stanley, his brother, who turned the scale in Henry's favour, but Thomas, who had taken no part in the fighting, was the first to salute the new king. Henry VII. confirmed Stanley in all his offices, and on Oct. 27, created him earl of Derby. As husband of the king's mother Derby held a great position, which was not affected by the treason of his brother William in Feb. 1495. In the following July the earl entertained the king and queen with much state at Knowsley. Derby died on July 29, 1504. Strange had escaped execution in 1485, but he died before his father in 1497, and his son Thomas succeeded as second earl. An old poem called *The Song of the Lady Bessy*, which was written by a retainer of the Stanleys, gives a romantic story of how Derby was enlisted by Elizabeth of York in the cause of his wife's son.

For fuller narratives see J. Gardner's *Richard III.* and J. H. Ramsay's *Lancaster and York*; also Seacombe's *Memoirs of the House of Stanley* (1741).

EDWARD STANLEY, 3rd earl of Derby (1508–1572), was a son of Thomas Stanley, 2nd earl and grandson of the 1st earl, and succeeded to the earldom on his father's death in May 1521. During his minority Cardinal Wolsey was his guardian, and as soon as he came of age he began to take part in public life. He helped to quell the rising known as the Pilgrimage of Grace in 1536, but remaining true to the Roman Catholic faith he disliked and opposed the religious changes made under Edward VI. Under Elizabeth his younger sons, Sir Thomas (d. 1576) and Sir Edward Stanley (d. 1609), were concerned in a plot to free Mary, queen of Scots, and he himself was suspected of disloyalty. He died at Lathom House, near Ormskirk, on Oct. 24, 1572.

Derby's first wife was Katherine, daughter of Thomas Howard, duke of Norfolk, by whom he had, with other issue, a son Henry, the 4th earl (c. 1531–1593), who was a member of the council of the North, and like his father was lord lieutenant of Lancashire. Henry was one of the commissioners who tried Mary, queen of Scots, and was employed by Elizabeth on other high undertakings both at home and abroad. He died on Sept. 25, 1593. His wife Margaret (d. 1596), daughter of Henry Clifford, 2nd earl of Cumberland, was descended through the Brandons from King Henry VII. Two of his sons, Ferdinando (c. 1559–1594), and William (c. 1561–1642), became in turn the 5th and 6th earls of Derby. Ferdinando, the 5th earl (d. 1594), wrote verses, and is eulogized by Spenser under the name of Amynias.

JAMES STANLEY, 7th earl of Derby (1607–1651), sometimes styled the Great Earl of Derby, eldest son of William, 6th earl, and Elizabeth de Vere, daughter of Edward, 17th earl of Oxford, was born at Knowsley on Jan. 31, 1607. During his father's life he was known as Lord Strange. He was elected M.P. for Liverpool in 1625, received high offices in the North of England, and on March 7, 1628, entered the House of Lords as Baron Strange. When the Civil War broke out in 1642, Lord Strange devoted himself to the king's cause. His plan of securing Lancashire at the beginning and raising troops there, which promised success, was however mis-

couraged by Charles, who was said to be jealous of his power and royal lineage and who commanded his presence at Nottingham. His subsequent attempts to recover the county were unsuccessful. After several defeats he left for the Isle of Man in June 1643 to attend to affairs there, and in the summer of 1644 he took part in Prince Rupert's successful campaign in the north when Lathom House, where Lady Derby had heroically resisted the attacks of the besiegers, was relieved, and Bolton Castle taken. He followed Rupert to Marston Moor, and after the complete defeat of Charles's cause in the north withdrew to the Isle of Man, where he held out for the king and offered an asylum to royalist fugitives. His administration of the island imitated that of Strafford in Ireland. It was strong rather than just. In July 1649 he refused scornfully terms offered to him by Ireton. By the death of his father on Sept. 29, 1642 he had succeeded to the earldom, and on Jan. 12, 1650, he obtained the Garter. On Aug. 15, 1651, he landed at Wyre Water in Lancashire in support of Charles's invasion, and met him on the 17th. Proceeding to Warrington he failed to obtain the support of the Presbyterians through his refusal to take the Covenant, and on the 25th was totally defeated at Wigan, being severely wounded and escaping with difficulty. He joined Charles at Worcester, after the battle he accompanied him to Boscorbel, and while on his way north alone was captured near Nantwich and given quarter. He was tried by court martial at Chester on Sept. 29, his quarter was disallowed and he was condemned to death. When his appeal for pardon to parliament was rejected, though supported by Cromwell, he endeavoured to escape, but was recaptured and executed at Bolton on Oct. 15, 1651. He was buried in Ormskirk church. According to Clarendon Derby was "a man of great honour and clear courage," and his defects the result of too little knowledge of the world. Lord Derby left in his "A Discourse concerning the Government of the Isle of Man" (printed in the *Stanley Papers* and in F. Peck's *Desiderata Curiosa*, vol. II) and several volumes of historical collections, observations, devotions (*Stanley Papers*) and a commonplace book. He married on the 26th of June 1626 Charlotte de la Trémoille (1599-1664), daughter of Claude, duc de Thouars, and granddaughter of William the Silent, prince of Orange, by whom besides four daughters he had five sons, of whom the eldest, Charles (1628-1672), succeeded him as 8th earl.

Charles's two sons, William, the 9th earl (c. 1655-1702), and James, the 10th earl (1664-1736), both died without sons, and consequently, when James died in February 1736, his titles and estates passed to Sir Edward Stanley (1689-1776), a descendant of the 1st earl. From him the later earls were descended, the 12th earl (d. 1834) being his grandson.

Haines (Chetham Soc. publications, vols. 61, 66, 67, 70), *Memoirs*, by De Lloyd (1668), 372, *State Trials*, v. 293-324, *Notes & Queries*, vii. Ser. II. 246, *Seacombe's House of Stanley*, *Clarendon's Hist. of the Rebellion*, Gardiner's *Hist. of the Civil War and Protectorate*, *The Land of Home Rule*, by Spencer Walpole (1893), *Hist. of the Isle of Man*, by A. W. Moore (1900), Manx Soc. publications, vols. 3, 25, 27.

The 14th earl is noticed separately (see below).

EDWARD HENRY STANLEY, 15th earl of Derby (1826-1893), eldest son of the 14th earl, was educated at Rugby and Trinity college, Cambridge, where he took a high degree and became a member of the society known as the Apostles. In March 1848 he unsuccessfully contested the borough of Lancaster and then made a long tour in the West Indies, Canada and the United States. During his absence he was elected member for King's Lynn, which he represented till October 1869, when he succeeded to the peerage. He delivered his maiden speech in May 1850 on the sugar duties. Just before, he had made a very brief tour in Jamaica and South America. In 1852 he went to India, and while traveling in that country he was appointed under secretary for foreign affairs in his father's first administration. From the outset of his career he was known to be a most Liberal Conservative, and in 1855 Lord Palmerston offered him the post of colonial secretary. He was much tempted by the proposal, and hurried down to Knowsley to consult his father, who called out when he entered

the room, "Hallo, Stanley! what brings you here?—Hullo! Do you cut his throat, or are you going to be married?" The offer was declined. In his father's second administration Lord Stanley held, at first, the office of secretary for the colonies, but became president of the Board of Control on the resignation of Lord Ellenborough. He had the charge of the India Bill of 1858 in the House of Commons, became the first secretary of state for India and left behind him in the India Office an excellent reputation. When the Greeks were looking round for a king after the death of King Otho, and the crown was refused by Queen Victoria for her son Alfred, there was some idea of inviting Stanley to take the vacant throne, but the offer was never formally made. After the fall of the Russell government in 1866 he became foreign secretary in his father's third administration. He comprised his conduct in that great post to that of a man floating down a river and fending off from his vessel, as well as he could, the various obstacles it encountered. He thought that that should be the normal attitude of an English foreign minister, and probably under the circumstances of the years 1866-1868 it was the right one. He arranged the collective guarantee of the neutrality of Luxemburg in 1867, negotiated a convention about the "Alabama," which, however, was not ratified, and refused to take any part in the Cretan troubles. In 1874 he again became foreign secretary in Disraeli's government. He acquiesced in the purchase of the Suez canal shares, he accepted the Andrassy Note, but declined to accede to the Berlin Memorandum. His part in the later phases of the Russo-Turkish struggle has never been fully explained, for he declined to gratify public curiosity at the cost of some of his colleagues. He resigned, and was prepared to explain in the House of Lords the course he had taken if those whom he had left challenged him to do so, but from that course they consistently refrained. By Oct. 1879 it was clear enough that he had thrown in his lot with the Liberal party, but it was not till March 1880 that he publicly announced this change of allegiance. He did not at first take office in the second Gladstone government, but became secretary for the colonies in Dec. 1882, holding this position till the fall of that government in the summer of 1885. In 1886 Derby joined the Liberal Unionists, and took an active part in the general management of that party, leading it in the House of Lords till 1891, when Lord Hartington became duke of Devonshire. In 1892 he presided over the labour commission. He died at Knowsley on April 21, 1893.

During a great part of Derby's life he was deflected from his natural course by the accident of his position as the son of the leading Conservative statesman of the day. From first to last he was at heart a moderate Liberal. In one of the highest qualities of a statesman, "aptness to be right," he was surpassed by none of his contemporaries, or—if by anybody—by Sir George Cornewall Lewis alone. His chief defect as a statesman was that in his anxiety to arrive at the right conclusions he sometimes turned and turned and turned a subject over till the time for action had passed. Although he cared but little for what is commonly known as society—the society of crowded rooms and fragments of sentences—he very much liked conversation. During the many years in which he was a member of "The Club" he was one of its most assiduous frequenters, and his loss was acknowledged by a formal resolution. His talk was generally grave, but every now and then was lit up by dry humour. The late Lord Arthur Russell once said to him, after he had been buying some property in southern England: "So you still believe in land, Lord Derby." "Hang it," he replied, "a fellow must believe in something!" He did much work outside politics. He was lord rector of the University of Glasgow from 1868 to 1871, and later held the same office in that of Edinburgh. From 1875 to 1893 he was president of the Royal Literary Fund, and attended most closely to his duties there. He succeeded Lord Granville as chancellor of the University of London in 1891, and remained in that position till his death. He lived much in Lancashire, managed his enormous estates with great skill, and did a great amount of work as a local magnate. He married in 1870 Maria Catharine, daughter of the 5th earl de la Warr, and widow of the 2nd marquess of Salisbury.

The best account of the 15th Lord Derby is that which was prefixed by W E H Lecky, who knew him very intimately, to the edition of his speeches outside parliament, published in 1894.

The earl left no children and he was succeeded as 16th earl by his brother **FREDERICK ARTHUR STANLEY** (1841-1908), who had been made a peer as Baron Stanley of Preston in 1836. He was secretary of state for war and for the colonies and president of the board of trade, and was governor-general of Canada from 1888 to 1893. He died on June 14, 1908.

EDWARD GEORGE VILLIERS STANLEY, 17th earl of Derby (1865-1948), was educated at Wellington college and served in the Grenadier Guards from 1885 to 1893. During the South African War he acted first as press censor, then as A.D.C. to Lord Roberts. He sat in the house of commons for West Houghton, was a lord of the treasury (1895-1900), financial secretary to the war office (1900-03) and postmaster general (1903-05). He was the recipient of many honours, including the Garter (1914). In Oct. 1915 he became director of recruiting for the army, and as such was responsible for a new scheme for a final effort on behalf of voluntary service known as the Derby scheme. In Feb. 1916 Lord Derby became chairman of the naval and military air service joint committee but resigned in April, becoming under secretary for war in July. On the formation of D. Lloyd George's government in Dec. 1916 he became secretary for war. From April 1918 to Nov. 1920 he was British ambassador to France. In Oct. 1922 he became secretary for war in Bonar Law's cabinet, retaining this position under Stanley Baldwin until Jan. 1924. He died on Feb. 4, 1948, at Knowsley, near Prescot, Lancashire, Eng.

DERBY, EDWARD GEOFFREY SMITH STANLEY, 14th earl of Derby (1799-1869), the "Rupert of debate," born at Knowsley in Lancashire on March 29, 1799, grandson of the 12th earl and eldest son of Lord Stanley, subsequently (1834) 13th earl of Derby (1775-1851). He was educated at Eton and at Christ Church, Oxford, and in 1819 he obtained the chancellor's prize for Latin verse, the subject being "Syracuse." As a boy he practised elocution under the instruction of Lady Derby, his grandfather's second wife, the actress, Elizabeth Farren. In 1820 he was returned for Stockbridge in Hampshire, one of the nomination boroughs whose electoral rights were swept away by the Reform Bill of 1832. Stanley being a warm advocate of their destruction.

His maiden speech was delivered early in the session of 1824 in the debate on a private bill for lighting Manchester with gas. On May 6, 1824 he delivered a vehement and eloquent speech against Joseph Hume's motion for a reduction of the Irish Church establishment, maintaining in its most conservative form the doctrine that church property is as sacred as private property. From this time he was acknowledged to be one of the most powerful speakers in the House. In the autumn of 1824 Stanley went on an extended tour through Canada and the United States with Henry Labouchere, afterwards Lord Taunton, and Evelyn Denison, afterwards Lord Ossington. In 1825 he married the second daughter of Edward Bootle-Wilbraham, created Baron Skelmersdale in 1828, by whom he had a family of two sons and one daughter who survived.

At the general election of 1826 Stanley was returned for borough of Preston, where the Derby influence was paramount. The change of seats left him free to speak against the system of rotten boroughs with great force during the Reform Bill debates, without laying himself open to the charge of personal inconsistency as the representative of a place where, according to Gay, cobblers used to "feast three years upon one vote." In 1827 Derby and other Whigs made a coalition with Canning on the defection of the more unyielding Tories, and he became under-secretary for the colonies. The coalition was broken up by Canning's death in August. During the administration of the duke of Wellington (1828-1830), Stanley and those with whom he acted were in opposition. His robust and assertive Liberalism about this period seemed curious afterwards to a younger generation who knew him only as the very embodiment of Conservatism.

On the advent of Lord Grey to power in Nov. 1830, Stanley was appointed to the chief secretaryship of Ireland. On accepting office he had to vacate his seat for Preston and seek re-election,

and he had the mortification of being defeated by the Radical, "Orator" Hunt. The contest was a peculiarly keen one, and turned upon the question of the ballot, which Stanley refused to support. He re-entered the House as one of the members for Windsor, Sir Hussey Vivian having resigned in his favour. In 1832 he again changed his seat, being returned for North Lancashire.

Stanley was one of the most ardent supporters of the Reform Bill. Reference may be made especially to his eloquent speech on March 4, 1831 on the adjourned debate on the second reading of the bill. Apart from his connection with the general policy of the government, Stanley had a difficult task in his own office. Ireland was in a very unsettled state. The concession of Catholic emancipation had excited the people to make all sorts of demands, reasonable and unreasonable. "Scorpion Stanley," as O'Connell called him, discharged with determination the ungrateful task of carrying a coercion bill through the House. It was generally felt that O'Connell, powerful though he was, had fairly met his match in Stanley, who, with invective scarcely inferior to his own, evaded no challenge, ignored no argument, and left no taunt unanswered. The title "Rupert of debate" is peculiarly applicable to him in connection with the fearless if also often reckless method of attack he showed in his parliamentary war with O'Connell. It was first applied to him, however, 13 years later by Sir Edward Bulwer Lytton in *The New Timon*—

One after one the lords of time advance,
Here Stanley meets—here Stanley scorns the glance!
The brilliant chief irregularly great,
Frank, haughty, rash,—the Rupert of debate.

The best answer, however, to the attacks of the great agitator was the beneficial legislation which Derby secured for Ireland. He introduced and carried the first national education act for Ireland, one result of which was the remarkable and to many almost incredible phenomenon of a board composed of Catholics, Episcopalians and Presbyterians harmoniously administering an efficient education scheme. In 1833, just before the introduction of the Irish Church Temporalities Bill, Stanley had been appointed secretary for the colonies, with a seat in the cabinet. In this capacity he introduced the bill for freeing the slaves in the West Indies, on May 14, 1833, in one of his most eloquent speeches.

The Irish Church question determined more than one turning-point in his political career. In 1834 the proposal of the government to appropriate the surplus revenues of the church to educational purposes led to his secession from the cabinet, and, as it proved, his complete and final separation from the Liberals. Sir James Graham, the earl of Ripon and the duke of Richmond, also left the cabinet on the same issue. O'Connell, speaking in the House, described the secession in a couplet from Canning's *Loves of the Triangles*—

Still down thy steep, romantic Ashbourne, glides
The Derby dilly carrying six misdeeds.

Stanley spoke against the bill and against its authors with a bitterness that he himself is understood to have afterwards admitted to have been unseemly towards those who had so recently been his colleagues. The course followed by the government was "marked with all that timidity, that want of dexterity, which led to the failure of the unpractised shoplifter." His late colleagues were compared to "thumble-riggers at a country fair," and their plan was "petty larceny, for it had not the redeeming qualities of bold and open robbery."

In the end of 1834, Lord Stanley, as he was now styled by courtesy, his father having succeeded to the earldom in October, was invited by Peel to join the short-lived Conservative ministry which he formed after the resignation of Melbourne. Though he declined the offer for reasons stated in a letter published in the Peel memoirs, he acted from that date with the Conservative party, and on its next accession to power, in 1841, he accepted the office of colonial secretary, which he had held under Lord Grey. His position and his temperament alike, however, made him a thoroughly independent supporter of any party to which he attached himself. When, therefore, consideration of health

arising from the late hours in the Commons led him in 1844 to seek elevation to the Upper House in the right of his father's barony. Peel was rid of a too candid friend in the Commons and was assured of strong debating power in the Lords. But when Peel accepted the policy of free trade in 1846, the breach between him and Stanley was, as might have been anticipated, instant and irreparable. Stanley at once became the recognized leader of the Protectionist party, having Lord George Bentinck and Disraeli for his lieutenants in the Commons. They did all that could be done when the logic of events was against them, though Protection was never to become more than their watchword.

Lord Derby, who had succeeded to the earldom on the death of his father in June 1851, was called upon to form his first administration in Feb. 1852. He was in a minority, but the circumstances were such that no other than a minority government was possible, and he resolved to dissolve parliament and appeal to the country at the earliest opportunity. The election did not materially alter the position of parties. Parliament met in November and in December the ministry had resigned in consequence of their defeat on Disraeli's budget. For the next six years, during Lord Aberdeen's "ministry of all the talents" and Lord Palmerston's premiership, Lord Derby led the opposition, whose policy gradually became more generally Conservative and less distinctively Protectionist as the hopelessness of reversing the measures adopted in 1846 made itself apparent. In 1855 he was asked to form an administration after the resignation of Lord Aberdeen, but failing to obtain sufficient support he declined the task. After the defeat of Lord Palmerston on the Conspiracy Bill in Feb. 1858, he formed his second ministry. Though he still could not count upon a working majority, defeat was avoided for a whole session, owing chiefly to the dexterous management of the Commons by Disraeli. During the session of 1858 the government carried two important measures, one a bill to remove Jewish disabilities, and the other a bill to transfer the government of India from the East India Company to the crown. Next year the question of parliamentary reform had to be faced, and the government introduced a bill at the opening of the session, which was rejected by the House, and, on a dissolution, rejected also by the country. After a vote of no confidence (June 10) in the new parliament Derby at once resigned.

He now devoted much of the leisure the position afforded him to congenial classical studies. It was his reputation for scholarship as well as his social position that had led in 1852 to his appointment to the chancellorship of the university of Oxford, in succession to the duke of Wellington. His *Translations of Poems Ancient and Modern* (1862) was privately printed. Its reception by those to whom it was circulated encouraged him to proceed with his *magnum opus*, the translation of the whole of the *Iliad*, which appeared in 1864.

During the seven years that elapsed between Lord Derby's second and third administrations the terrible industrial crisis in Lancashire caused by the stoppage of the cotton supply in consequence of the American Civil War, absorbed much of his time and thought. Derby worked unceasingly for its relief. His personal subscription, munificent though it was, represented the least part of his service. His noble speech at the meeting in Manchester in Dec. 1862, where the movement was initiated and his advice at the subsequent meetings of the committee, were of the very highest value in stimulating and directing public sympathy. His relations with Lancashire had always been cordial, after the cotton famine period the cordiality passed into a warmer and deeper feeling among the factory operatives.

On the rejection of Russell's Reform Bill in 1866, Derby formed his third cabinet. It was destined to be short-lived, but lasted long enough to settle on a permanent basis the question that had proved fatal to its predecessor. The passing of the Reform Bill was the main business of the session 1867. The chief debates were, of course, in the Commons, and Derby's failing powers prevented him from taking any large share in those which took place in the Lords. His description of the measure as a "leap in the dark" was eagerly caught up, because it exactly represented the common opinion at the time,—the most expe-

rienced statesmen, while they admitted the granting of household suffrage to be a political necessity, being utterly unable to foresee its effect on the constitution and government of the country.

Declining health compelled Derby to resign office in Feb. 1868. He yielded the entire leadership of the party as well as the premiership to Disraeli. His subsequent appearances in public were few and unimportant. His last speech in the House of Lords, denunciation of Gladstone's Irish Church Bill, was marked by much of his early fire and vehemence. A few months later, on Oct. 23, 1869, he died at Knowsley.

Lord Aberdeen was reported by *The Times* to have said that no one of the giants he had listened to in his youth, Pitt, Fox, Burke or Sheridan, "as a speaker, is to be compared with our own Lord Derby, when Lord Derby is at his best." (G. Saintsbury, *Lord Derby*, 1906.)

DERBY (dar bi), a county and parliamentary borough and the county town of Derbyshire, England, 60 mi SE of Manchester on the LMSR and LNER Pop (1938) 139,000. Area 12.7 sq mi. Occupying a position almost in the centre of England, the town is situated on the Derwent, at the southern end of the Pennines. It is the centre of an important network of routes since early times and more especially since the Industrial revolution. A little to the NE is Littlecote which was the site of a Roman fort or village. Under the heptarchy Derby was known as Northwyrth, receiving its present name from *Deoraby* as it was known to the Danes after the Treaty of Wedmore. It was reconquered by Athelstan in 917, and prospered during the 10th century, but much of the land was waste at the time of Domesday. The first charter was granted in 1206 giving it all the privileges which Nottingham had in the time of Henry I and Henry II. The charter provides that no one shall dye cloth within ten leagues of Derby except in the borough. A charter of Henry III in 1260 granted that no Jew should be allowed to live in the town. Edward III granted the petition of the burgesses for two bailiffs. In 1745 the young pretender marched as far south as Derby, where it was decided that he should return to Scotland instead of going on to London.

Among interesting buildings are St. Peter's church, a fine building of Perpendicular date but with earlier portions, St. Alkmund's and St. Andrew's, in the Decorated style, and All Saints' with a beautiful choir screen and good stained glass. The church tower was built 1509-27, and is one of the finest in the midland counties. Derby grammar school was placed in 1159 under the administration of the chapter of Darley abbey. It now occupies St. Helen's house. Derby possesses a municipal technical college, schools of science and art, a public library, museum and art gallery, an agricultural institute, and Liversage's almshouses, a foundation inaugurated by Robert Liversage in 1529. A town planning scheme was adopted in 1929, while under a central improvement plan a covered market, a bus station, police buildings and riverside gardens were constructed. Further improvements to the river were also carried out.

Derby is celebrated for its porcelain. This manufacture was introduced about 1750, and although partially abandoned, it has been revived. The manufacture of silk, hosiery, lace and cotton formerly employed large numbers, and there are still numerous silk mills and elastic webworks. Silk "throwing" or spinning was introduced into England from Piedmont in 1717 by John Lombe, who set up machinery in Derby. In the 19th century the principal centre of the Midland railway was established at Derby. It is still a leading centre under LMS control. Other industries include the manufacture of aircraft, motor cars, especially the Rolls Royce car, as well as of electrical apparatus, paint, shot, white and red lead and varnish, and there are saw-mills and tanneries. The manufacture of hosiery profited greatly by the inventions of Jedediah Strutt about 1750. In Littlecote there are chemical and steam boiler works. Derby was a bishopric suffragan in the diocese of Southwell but in 1927 became a separate bishopric. The parliamentary borough returns two members.

DERBY, a city of New Haven county, Connecticut, U.S.A., 10 mi W of New Haven, on the Housatonic river at the mouth of the Naugatuck, just below Ansonia and opposite the borough

of Shelton. The population was 10,259 in 1950 and 10,287 in 1940 by the federal census. Derby was settled in 1643 as an Indian trading post called Pugasasset, and received its present name in 1675. It was chartered as a city in 1893. In the 18th century it had a thriving commerce with the West Indies.

It was the birthplace of David Humphreys (1752-1818), Washington's aide and military secretary from 1780 to the end of the war, first minister of the United States to Portugal (1790-97) and minister to Spain (1797-1802), and one of the 'Hartford Wits', and of Commodore Isaac Hull (1773-1843), commander of the U.S. frigate "Constitution" ("Old Ironsides") during the War of 1812.

DERBYSHIRE, a north midland county of England, bounded north and northeast by Yorkshire, east by Nottinghamshire, southeast and south by Leicestershire, south and southwest by Staffordshire, and west and northwest by Cheshire. The area of the geographical county is 1,006 sq mi with a population of 826,336 (1951 census).

The county may be divided into two sections—the northern upland region culminating in the High Peak, and the southern lowland area around Derby.

The north is made up of Carboniferous limestone, millstone grit and the coal measures, while the lowland south is mainly underlain by red Triassic rocks.

Geology.—The Carboniferous or "Mountain" limestone in the northwest of the county is the oldest formation, its thickness is over 2,000 ft. It is well exposed in the numerous narrow gorges cut by the Derwent and its tributaries and by the Dove on the Staffordshire border.

The limestone uplands are bleak and dry generally with smooth outcrops cut by deep ravines. Many of these glens are richly wooded. Volcanic rocks, locally known as "Toadstone" are represented in the limestones by intrusive sills and flows of dolerite and by necks of agglomerate notably near Tideswell, Millersdale and Matlock.

The highest ground in the extreme north of the county is capped by bleaks and sometimes by the millstone grit. In this region are Blacklow hill (2,060 ft.), Shelf Moss (2,046 ft.), Kinder Scout (2,088 ft.) and other summits of the Peak itself. A series of black shales with nodular limestones, the Pendleside series rests upon the mountain limestone on the east, south and northwest, much of the upper course of the Derwent has been cut through these soft beds. Main tor (1,700 ft.) is made of these shales. Then follows a thick mass of sandstones, grits and shales—the millstone grit series. On the west side these extend from Blacklow hill to Axe Edge, on the east, from Derwent Edge to near Derby. A patch of millstone grit and limestone occurs in the south of the county about Melbourne and Ticknall.

The coal measures rest upon the millstone grit, the largest area of these rocks lies on the east, where they are coterminous with the coalfields of Yorkshire and Nottingham. A small tract, part of the Leicestershire coalfield, lies in the south of the county, and in the northwest corner a portion of the Lancashire coalfield appears about New Mills and Whaley Bridge. The coal measure country is gently moulded. East of Bolsover the coal measures are covered unconformably by the Permian breccias and magnesian limestone. South of a line through Ashbourne, Quarndon and Stanford, the land is at a much lower level. Flanking the hills between the former towns are red beds of Bunter, sandstone and conglomerate, they also appear at Morley, east of the Derwent, and again round the small southern coalfield. Most of the south part of the county is covered superficially by glacial drift and alluvium of the Trent. Local boulders as well as northern erratics are found in the valley of the Derwent. The bones of Pleistocene mammals—the rhinoceros, mammoth, bison, hyena, etc., have been found at numerous places, often in caves and fissures in the limestones, e.g., at Castleton, Wirksworth and Cresswell. At Doveholes the Pleistocene *Mastodon* has been reported.

The rivers of the county radiate from the northern hills. Those of the northwest belong to the Mersey and those of the north east to the Don, but all the others to the middle Trent which forms part of the southern county boundary with Leicestershire.

The tributary streams of the Trent, of which the Derwent, Dove and Erewash are the most important, flow from north northwest to south-southeast over the Carboniferous, but turn almost west northwest to east southeast on the newer rocks before they enter the middle Trent, flowing roughly east northeastwards. The Dove flows as the boundary between Derbyshire and Staffordshire for nearly its entire course. The Derwent rising in the High Peak flows southward, almost bisecting the county. The Erewash is the boundary stream between Nottinghamshire and Derbyshire. The Goyt rises a little farther north than the junction of the three counties—Staffordshire, Cheshire and Derbyshire, and flows north northeastward dividing Derbyshire from Cheshire and finally falls into the Mersey.

Climate.—The winters in the uplands are generally severe, and the rainfall heavy. At Buxton (1,000 ft.) the mean temperature in January is 34.9° F., and in July 57.5°, at Derby, in the southern lowland, the figures are respectively 37.5° and 61.2°, intermediate conditions are found at Belper where the figures are 36.3° and 59.9°.

The contrasts shown by the mean annual rainfall are similarly marked, ranging from 52.03 in at Woodhead in the north of the county through 35.2 in at Matlock and 24.35 in at Derby in the south.

History.—Important traces of the cultures of the late Palaeolithic age in Cresswell crags have been discovered.

The early settlement of Derbyshire was confined almost entirely to the well drained Carboniferous limestone lands of the Peak. The marked Derbyshire group of Beaker pots indicates an important settlement of the dawn of the age of metals around the Peak district. It is thought that the Beaker folk came from the continent via the east coast, and groups apparently from the East Riding of Yorkshire reached the Derbyshire Peak district, others penetrated from the East Anglian coasts inland over the English plain. There are numerous Megalithic remains in the same area, the stone circle being much in evidence. The largest circles are those of Arbor Low, near Hartington, which retains most of its stones, and the "Bull Ring," at Dove Holes, near Chapel-en-le-Frith. Finds of bronze age weapons and implements are not so numerous as in the neighbouring counties. Many defensible sites, especially in the north of the country, are capped by ancient camps. Mam tor, near Castleton, and Carl's Wark, near Hathersage, are good examples. It is impossible to assign a date to these structures as they were probably in use over a great length of time. Structures of this type were important in Romano-British and post-Roman times. The Romans were the first to utilize the lowlands to any great extent. At this period Littlecheaster, a camp to the northeast of Derby, became a focus of ways, receiving Rykneld street in particular. Aquae (Buxton), Anavio (near Castleton) and Melandra (west of Glossop) were sites in the north of the county.

The post Roman centuries revived interest in the north until the conquests of the West Angles in the 6th century brought them up the valleys of the Derwent and the Dove.
